SUBJECT: ITAR Amendment – Category XII; RIN 0694-AF75

The Aerospace Industries Association (AIA) and our member companies welcome the opportunity to provide comment on the proposed revised rule for U.S. Munitions List (USML) Category XII (Fire control, range finder, optical and guidance and control equipment) of the International Traffic in Arms Regulations (ITAR) and the corresponding controls on the Commerce Control List (CCL) of the Export Administration Regulations. While our members are encouraged with the continued progress on the Export Control Reform (ECR) initiative, we have several concerns, highlighted below, regarding the Category XII proposed rule and corresponding EAR revisions.

AIA continues to support the Administration's goal of eliminating the confusion and ambiguity that arise from overly restrictive control lists that contain numerous redundancies, leading to an inefficient system with an adverse impact on the U.S. economy and by extension the domestic industrial base. With this goal in mind, it is our concern that the proposed Category XII revisions will negatively impact our member companies' ability to compete in the global marketplace.

The intent of the ECR initiative was not to roll-back controls on ubiquitous technologies that have an inherent dual-use purpose and have been controlled as commercial items for decades. Yet, many items with wide-spread commercial availability in foreign markets will either remain controlled under the ITAR, or in fact move from a lower to higher level of control under these proposed changes. In some instances, the proposed controls do not eliminate ambiguity, relying on design intent to determine jurisdiction or parameters that do not reflect military-specific or most-sensitive capabilities that warrant continued control as munitions items. Furthermore, we encourage the elimination of redundant USML entries across categories, which will greatly improve the efficiency with which items can be classified.

Finally, it is critical to have clear and specific definitions for a number of terms used throughout Category XII, the USML writ large, and the EAR, such as the terms "military" and "commercial." We encourage the Administration to use specific performance parameters, some of which we have included below, to clarify these definitions.

AIA and our member companies thank the Administration for their continued efforts in implementing Export Control Reform, and for considering our comments and proposed revisions.

ITAR Amendment - Category XII

General Comments:

Definition of "Equipment" and its use in Cat XII (and other categories)
We request that the current definition of "equipment" be better defined. Currently, the term "equipment" can be applied to almost any item, including any combination of the listed entries in 120.45 (a)-(g). "Equipment" can be hardware or software, it can be an end-item or not, it can be a system or parts, pieces, components of a system or it can be a separate accessory or attachment to a system. We recommend clarifying the term "Equipment" by amending the ITAR definition to: "Equipment is an end-item used in the production, testing, inspection, or maintenance of an end-item, combination of parts, components, accessories, attachments, firmware, or software." Similar to "accessories" or "attachments," "equipment" is often referring to associated articles that are not parts or components of the system itself; but differs in that the functions and capabilities are similar to items as described in the CCL "B" Group.

We further recommend "equipment" be only enumerated or otherwise described in paragraph XII(e). The term "equipment" is not needed in major system and sub-system paragraphs of Cat XII (as well as in Cat XI or others); however, since the term "equipment" has wide-ranging application, it has the unintended consequence of controlling previously XII(e) parts, pieces, components, accessories and attachment as significant military equipment in paragraphs XII(a)-(c). For example, "equipment" is not needed to be described or controlled in Cat XII(b)(2), "Aiming or target illumination systems or equipment having a laser output wavelength exceeding 710 nm." Only the aiming or target illumination "systems" should be controlled as SME; however, the addition of "or equipment" adds controls beyond the system itself to control the tripod, cleaning kit, adapter cables, and even the transport carry bag. These minor equipment items should have moved from XII(e) to the CCL; but, are now controlled and designated SME on the USML.

SME classification for parts, pieces, and components
We recommend parts, pieces and components only be enumerated or described in XII(e) and the SME designation be removed from the XII(a), (b), (c) & (f) major paragraphs. SME designation should only be placed on individual subparagraphs as appropriate and consistent with SME controls for systems, parts, and components, etc. found in other USML categories. For example, XII(a)(1) enumerates fire control systems, but now also controls formerly XII(e) specially designed parts and components as SME. Helmet

mounted display systems for a combat vehicle are designated SME in XII(a)(9); however, if the helmet mounted display is for an aircraft it is not designated SME in VIII(h)(15).

Similarly, controlling all technical data and defense services related to the defense articles enumerated in this category (XII(f)) as SME has broad ramifications on existing commercial practices. We recommend removing SME control from this category or limiting the application of SME to data and services related to items of greatest military significance.

Order of Review

One purpose of ECR was to create bright lines for unambiguous classification of articles; however, similar/identical technologies continue to be described in multiple entries in addition to being subject to various "catch-all" paragraphs on the USML (e.g. fire control systems). At the same time, an article can also have multiple capabilities which meet the criteria in multiple entries, even in different categories, creating conflict and difficulty in classifying the article. For example, by definition every system with a cooled thermal imager meets the requirements of multiple sections of the document. We therefore first recommend reconciling and eliminating duplicate/overlapping entries where ever possible in the USML; starting with this proposed rule.

For example, Category XV (Spacecraft Systems and Related Articles) and Category XII appear to overlap in several areas. While this does not affect licensing jurisdiction, clarification for where an item is controlled is critical to industry compliance with U.S. export control laws and regulations. In particular, some redundant controls may treat an item as SME. Specific examples include, but may not be limited to:

- Spacecraft payload cable: Category XV(e)(17) or Category XII(a)(7)
- Lasers: Category XV(a)(5) or Cat XII
- Spacecraft Gyroscopes: Category XV(e)(13) or Cat XII(d)(3)
- Developmental Imaging Systems: Category XV(e)(18) or Category XII(c)(21)

Second we recommend adding language to §121.1 USML (b)(1) Order of Review to provide clear guidance for the classification of an article that meets the criteria for multiple USML entries. Should the particular characteristics and functions of an article match more than one entry; it is recommended the entry with the highest level of control (i.e. SME over non-SME or MT over non-MT controlled) be the appropriate classification. Also, to better align with the EAR, it is also recommended that enumerated articles or "otherwise described" articles take precedence over "catch all" paragraphs. Finally, if a defense article still meets the criteria for multiple equally controlled sub-paragraphs, the single predominant subparagraph shall take precedence. While these clarifications were not necessary prior to ECR as each USML category had only one "catch-all" paragraph for all parts, components, etc., they are now essential in order for industry to have a common understanding of the order of review for classifying items.

Finally, an order of precedence/review is necessary for USML categories where conflict/overlap remains between air, land, sea, and space systems and their Cat XI and XII components. Category XI currently defers to Cat XII by clarifying "Electronic equipment and systems not included in Category XII of the U.S. Munitions List," but there are still other instances which need to be reconciled. We recommend XI and XII take precedence over other USML categories with the possible exception of Category XV, as it includes Category XI and XII items that are then "space qualified." We recommend similar language be added as found in XI(a) to, as necessary, provide clear guidance on whether Category XV or Categories XI or XII takes precedence. For the remaining categories we recommend adding "not included in Category XI or XII of the USML" as follows:

> Cat VI(f) Vessel and naval equipment, parts, components, accessories, attachments, associated equipment, and systems not included in Category XI or XII of the USML, as follows:
>
> Cat VII(g) Ground vehicle parts, components, accessories, attachments, associated equipment, and systems, not included in Category XI or XII of the USML, as follows:
>
> Cat VIII(h) Aircraft parts, components, accessories, attachments, associated equipment and systems, not included in Category XI or XII of the USML, as follows:
>
> Cat X(a) Personal protective equipment, not included in Category XI or XII of the USML, as follows:
>
> Cat XX(c) Parts, components, accessories, attachments, and associated equipment, including production, testing, and inspection equipment and tooling, specially designed for any of the articles in paragraphs (a) and (b) of this category and not included in Category XI or XII of the USML, (MT for launcher mechanisms specially designed for rockets, space launch vehicles, or missiles capable of achieving a range greater than or equal to 300 km).

Paragraph (a) Fire control, weapons sights, aiming, and imaging systems and equipment:

(1) Fire control systems: We recommend control of these systems, regardless of end use platform (air, land, or sea), under Cat XII and not designated SME. Fire control systems are proposed to be controlled without caveats or exclusion and their specially designed components, as SME, in Cat XII(a)(1). However; fire control computers, stores management systems, armament control processors, etc. are currently non-SME controlled in USML Cat VI(f)(6), VII(g)(12), VIII(h)(16), and also in the catch-all XX(c). We recommend implementing the order of review proposal we have outlined above, removing the redundancy across USML categories by controlling all fire control systems, etc. under one USML entry.

(9) Helmet mounted display systems: We recommend removing this system from USML Cat VIII(h)(15). Cat XII(a)(9) should control all these devices based on stated performance parameters and not on end use. Therefore we recommend removing these systems from USML Category VIII(h)(15). We also recommend they not be SME controlled as they are not SME controlled in Cat VIII(h)(15).

Paragraph (b) Lasers, and laser systems and equipment:

The proposed controls on lasers and laser systems are overbroad, potentially capturing many commercial – and in some cases systems that have been controlled as EAR99 items. The note to (b)(6) notes that the controls on LIDAR and LADAR systems do not apply to certain civil automotive systems. Yet, there are also systems designed and utilized for civilian aviation and meteorological applications deployed in numerous international civilian airports that would apparently be captured under Category XII.

Controlling all LIDAR and LADAR systems as munitions items will inhibit commercial innovation and undermine the U.S. industrial capability to deliver quality systems for the U.S. military. USML controls on these items should be limited to sensitive technologies and military-specific capabilities. Accordingly, paragraph (b) would benefit from not only expanding the exclusion beyond civil automotive applications to include other civilian systems, but also from providing more clearly defined parameters for those items that remain on the USML:

(b)(1) Laser target designators: We recommend defining, in terms of performance parameters, what constitutes a USML laser target designator.

(b)(3)(ii) Laser output wavelength exceeding 1,000nm would control a large number of commercially available laser rangefinders due to the eye safety improvements and availability of low-cost pulsed diodes.

(b)(7) Synthetic aperture LADAR systems with standoff greater than 100m would limit many potential commercial uses for these cameras.

(b)(8)(i) & (ii) The capabilities defined in (8)(i) (resolution of 0.2m or less from an altitude of 16,500 ft) and incorporating a gimbal-mounted transmitter/beam director is easily achieved with commercially available systems with gimbals. The range/resolution requirements specified in (8)(ii) would similarly control capabilities that could be achieved with commercial off-the-shelf components.

(b)(8)(4) Is the intent to control a full system including the algorithms, or just the LADAR capability? Specifying the capability for a heterodyning system with CNR less than 10 is not useful without range parameters, as CNR is range dependent.

(b)(10) Controls on tunable lasers should include a metric for turnability, as there are many commercial products with this capability.

(b)(13) Laser stacked arrays: We request clarification on the location of the power density to be measured, i.e. measured at the laser aperture or elsewhere?

Paragraph (c) Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores:

(c)(2) Photon detector, micro bolometer detector, etc.: We request further definition/clarification as to what constitutes an "encapsulated sensor assembly."

(c)(4) Two-Dimensions photon detectors, etc.: We request clarification if "greater than 256 detector elements" refers to the total number of elements or the number of elements in either direction.

(c)(10) Gimbals with two or more axes of active stabilization having a minimum RMS stabilization less than 200 microradians, and specially designed etc.: As currently written, we believe the catch and release criteria of the "specially designed" definition would "release" nearly every gimbal under (b)(3) because they have "the same function, performance capabilities, and the same or 'equivalent' form and fit, as a commodity or software that: (i) is or was in "production" (i.e., not in "development"); and (ii) is not 'enumerated' on the [USML]." To better clarify the reason for control, it is suggested that the phrase "specially designed for articles controlled in this subchapter" be rewritten similar to USML XI(a)(5)(i) "are specially designed to integrate, incorporate, network, or employ defense articles that are controlled in paragraphs or subparagraphs of the categories of §121.1 of this part that do not use the term specially designed" and/or define specific military characteristics that warrant control.

(c)(11) Gimbals with two or more axes of active stabilization having a minimum RMS stabilization less than 100 microradians: This paragraph does not distinguish between commercial gimbals and those use in or with defense articles. We recommend adding "specially designed for defense articles in this chapter" to ensure that widely-available and utilized commercial capabilities are not controlled under the ITAR. The note about the "non-removable camera payload" would impact commercial gimbal systems " where the customer would like to switch between various styles of commercial visible cameras. The interchangeability of the camera payload feature is used by numerous film makers who would like to switch between various types of commercial visible cameras to capture various images. The proposed rule would force these commercial users to buy more than one gimbal because they use more than one camera. The note could be rewritten to limit the tampering of the system that could prevent an impermissible camera such as ultra-violet, infrared or laser payload from being used in the gimbal system.

<u>**Paragraph (d) Guidance, navigation, and control systems and equipment:**</u>

Inertial sensor and systems nomenclature: We recommend that inertial sensor and systems nomenclature reflect designations in the 2010 DoD "Policy for International Transfer and Export Control of Inertial Navigation Systems, Gyroscopes, Accelerometers' Other Systems and Related Technology" and the CCL Category 7; namely, Accelerometers; Gyroscopes; Airborne INS; Land INS; Marine INS; IMU and AHRS. We believe a consistent nomenclature would be extremely helpful to industry and the government in relating one classification to another and driving consistency among various requirements. It is also recommended the government work toward aligning all USML, CCL, DOD policies, MTCR and license proviso nomenclatures.

Note to paragraph (d)(1): We recommend deleting "Note to paragraph (d)(1)" as well as removing and reserving USML Cat IV(h)(1), Cat VI(f)(4) & Cat III(c)(1). This would place controls for the same/similar technology for all guidance, navigation and control systems in XII(d) verses multiple USML categories. Navigation systems were already removed from Cat XI and this proposed rule already removes and reserves USML Cat VIII(e) which is also referenced in the "Note to paragraph (d)(1)."

Note 1 to paragraph (d)(2): We recommend deleting "Note 1 to paragraph (d)(2)." All accelerometers should be controlled in this category. USML fuze accelerometers should be controlled in XII(d)(2) vs. III(d) or IV(h) for same rationale above.

We also recommend adding notes to paragraphs III(d) and IV(h) redirecting to XII(d) for accelerometer fuzes, as follows:

> Cat III(d)(2): Safing, arming and fuzing components (including target detection and localization devices) for the articles in paragraph (a) of this category; and
> Note to paragraph III(d)(2): For weapon fuze accelerometers, see USML Category XII(d);
>
> Cat IV(h)(25): Fuzes specially designed for articles enumerated in paragraph (a) of this category (e.g., proximity, contact, electronic, dispenser proximity, airburst, variable time delay, or multi-option) (MT for those fuzes usable in systems enumerated in paragraph (a)(1) of this category);
>
> Note to paragraph VI(h)(25): For weapon fuze accelerometers, see USML Category XII(d).

Note 3 to paragraph (d)(2): We recommend clarifying that the measurement of 'bias' and 'scale factor' refer to one sigma standard deviation with respect to a fixed calibration over a period of one year.

Product line performance: We recommend a note be added to clarify how performance levels should be applied, i.e. are these performance levels against the product line or against each system? It is our recommendation that performance levels be applied against the product line – or model, where a manufacturer has developed a foreign export variant; otherwise there could be instances in which specific items from a product line would fall under USML CAT XII and other items from that product line would fall under CCL Category 7. This could result in significant confusion and increase per unit cost for US suppliers. We recommend using the certification methodology from the DOD Policy as well.

Performance parameters: We recommend that performance levels for USML Category XII be harmonized, excluding several specific exceptions, with "Policy for International Transfer and Export Control of Inertial Navigation Systems, gyroscopes, Accelerometers' Other Systems and Related Technology." DoD has already established that these levels of performance are of interest for control. Maintaining consistency between the DoD Export Policy and the USML would eliminate potential confusion. We recommend the following performance parameters:

Gyroscope: 0.0005deg/√Hr

> Recommend lowering the gyro Angle Random Walk performance value from 0.00125 deg/√Hr to 0.0005 deg/√Hr to better align the gyro with the accel and INS performance values. Angle Random Walk is clearly defined by the industry by invoking the Allan Variance. Rationale: this performance parameter is unambiguous and its value is more consistent with the levels specified for the accelerometer control.

Accelerometers: 10 µg and 10 ppm

> Using the term uncertainty rather than stability provides better clarity as how to define the terms. Note: Defining "uncertainty" and linking that to "stability" in the CCL is required to avoid confusion.

INS: Airborne INS: 0.28 nmph CEP; at a 1 hour period
Land INS: 0.28 mrad secant (Lat)
Marine INS: 0.2 nm in 8 hour period, CEP

> Providing distinct performance parameters for INS configured for airborne, land and marine applications will be easier to both industry and government to understand what is covered by Category XII. Also recommend inserting a statement that INS performance is without position aiding devices

IMU: Gyroscope and accelerometer parameters or airborne INS value

> Industry has two ways in which to describe an IMU; as the performance of the gyros and accels, which make up the IMU, or as an equivalent INS performance expressed in nmph CEP. With the proposed USML performance values, this would result in a bit of an asymmetry since the gyro performance levels are more consistent with an 0.8 nmph CEP performance. Thus, changing to the proposed gyro performance would provide the proper balance.

Given the performance parameters above, we recommend removing USML paragraph entry XII(d)(1)(iii), eliminating the "or 25 g" performance requirement. Assuming that the objective of Category XII is to control inertial performance of strategic value while letting the lower performance inertial be controlled by the CCL, the 25 g "or" condition will result in lower performing inertial systems remaining under USML jurisdiction. Defining performance levels, such as in the DoD Export Policy, is sufficient to maintain the intent of the control. We also recommend that a note be added to paragraph (d)(2) and (d)(3) to clarify that the ITAR "see-through rule" does not apply when these items are integrated into and included as an integral part of an item subject to the EAR.

(d)(6)(iv) GPS receiving equipment "specially designed" for use with rockets, missiles, SLVs, drones, or UAVs capable of delivering at least a 500 kg payload to a range of at least 300 (km) (MTCR Category 1 systems). GPS receiving systems for air-breathing UAVs do not require similar survivability capabilities as those that might be designed for inclusion on a rocket or missile. GPS systems would not be designed to take into account range/payload capability, as it is irrelevant to the operation of the system. Accordingly, this could be interpreted to capture virtually any GPS system capable of airborne operation. Moreover, the control relies on design intent, rather than positive criteria for control. The likely outcome would be that any UAV that integrates a GPS capability would be controlled on the USML, effectively negating previous efforts to control commercial/civilian UAVs on the Commerce Control List.

Paragraph (e): Parts, components, accessories, attachments, and associated equipment:

(9) Infrared lenses, mirrors, etc.: We recommend removing and reserving this entry and controlling these lesser items if "specially designed" on the CCL. Otherwise, we recommend providing performance threshold control parameters for each.

(10) & (11) Signal or image processing electronics: We recommend these items be placed under XI(b), or remove and reserve XI(b), or define/reconcile what is controlled between these USML entries.

(11)(i) Automatic or aided detection etc.: We recommend these terms be defined, including the threshold for what constitutes a "military or intelligence" item. Does the recognition/classification of a generic "man", "truck" or "plane" which can be performed by commercial systems meet this entry threshold or does the recognition/classification have to be a "military" soldier, a tank, or Mig-29. Being able to discriminate a commercial tanker truck or other item may not have any "intelligence" value unless combined with location or the number of trucks over a period of time.

Note to paragraph (e)(11)(ii). As currently written, this paragraph confirms that combining data from two Category XI systems does not constitute sensor fusion and is not USML controlled. This should be clearly stated in the note to ensure that the definition for multi-sensor fusion aligns with other USG standards, such as DoDI S-5230.28.

Paragraph (f): Technical data and defense services:

Notes 1, 2, & 3 to paragraph (f): We recommend the USG confirm their intent not to control any technical data or software which is not enumerated in these notes. As stated in the Supplementary Information of this proposed rule, these notes are revised to clearly describe the technical data and defense services controlled in paragraph (f). Note 2, paragraph A enumerated what software and technical data is "included" in paragraph (f). It did not make any reference or enumerate any entries in paragraph (d); therefore as written, any technical data, including manufacturing know-how, of a USML accelerometer, gyroscope, or INS is no longer enumerated on the USML. If it is the intent of the government to still control this data on the USML, we recommend a complete review of Notes 1, 2 & 3 to paragraph (f).

Note 2 paragraph C: These items are also enumerated or described in USML Cat IX(b). We recommend removing paragraph C or make a reference note in Cat IX(b) that these items are controlled in Cat XII(f).

Defense Services: We were pleased to see the 3 June 2015 published rule clearly state the maintenance of an item subject to the EAR that has been integrated or installed into a defense article not be defined as a defense service.

Software: We agree with the DOS decision to separate "software" from the definition of "technical data." We believe this is a positive step toward a single list and will make it easier to enumerate what software should be controlled as was attempted in Note 2 to paragraph (f).

Administrative Notes

Title: We recommend adding a clarifying comma to the title; "Fire Control, Range Finder, Optical, and Guidance and Control Equipment"

Proper use of "or": The second to last entries in XII(a), XII(b), and XII(c) should have "; or" at the end as done in XII(d) or XII(e) and rest of the USML. The third to the last entry in XII(c) is followed by "or" which should be deleted.

RIN 0694-AF75: Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, etc.

Under the proposed revisions to the EAR, it appears that certain cameras typically used for cinematic or news gathering applications would be moved from the non-ECR (e.g. non-500 or 600 series) ECCNs (e.g. 6A004, EAR99) into more-restrictive ECCNs (e.g. 6A615), increasing the level of control for articles that are in broad commercial use and have foreign availability. This runs contrary to the state purpose of ECR and AIA encourages the Administration to reconsider the implementation of this more-restrictive control.

Best Regards,

Remy Nathan

Subject: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII
To Whom It May Concern:

On behalf of AIA, the global trade group representing the vision and imaging industry, we appreciate the opportunity to comment on the proposed changes to the USML.

AIA has reviewed the comments submitted by SPIE, the international society for optics and photonics, and would like to add our support to the positions stated in those comments. AIA serves more than 330 member companies from 32 countries. Corporate AIA members include manufacturers of vision components and systems, system integrators, distributors, OEMs, end users, consulting firms, academic institutions and research groups directly involved with vision and imaging.

Best regards,

Bob McCurrach | Director of Standards Development

Request for Comments: Amendment to the International Traffic In Arms Regulations, Revision of the U.S. Munition List Category XII

Public Notice 9110

RIN-1400-AD32

To the Attention of Regulatory Change, USML Cat XII,
Email to DDTCpubliccomments@state.gov

Airbus Group N.V. offers the following comments in response to Public Notice 9110 pertaining to USML Category XII.

Cat XII b) (8) (v)

The text of the proposed rules reads: "*LIDAR, LADAR, or other laser range-gated systems or equipment, as follows: (v) Systems or equipment that automatically classify or identify….unexploded ordnance or improvised explosive devices (IED)*"

We are concerned that this definition may capture under the ITAR systems which are designed for homeland security (such as unattended baggage screening) and which, having the capability to determine chemical composition also have the capability to identify explosives, and are currently controlled under the EAR.

We suggest adding "specially designed" language in order to authorize the release from the ITAR under 120.41 as appropriate:

Proposed language: *Cat XII b) (v)* ***Specially Designed*** *Systems or equipment that automatically classify or identify ….unexploded ordnance or improvised explosive devices (IED)*

Cat XII b) (13)

The text of the proposed rules reads: "*Binoculars, …googles, or head or helmet-mounted imaging systems or equipment….that incorporate or are specially designed to incorporate any of the following, and specially designed electronics, optics and displays therefor:*"

We are concerned that the "*and specially designed electronics, optics and displays therefor:*" may capture items otherwise controlled under the EAR (such as cockpit displays or light indicators) , which have been modified to be compatible with Night Vision, such as choice of colour or optical filters avoiding blinding pilots wearing night vision googles). These modifications does not bring in themselves any of the capabilities described in the paragraph. We believe that the intent is to capture only items which contribute to the described capability and not items which are merely compatible with the capability.

We suggest completing Note to paragraph (c) 13 as follows:

Proposed language:

Note to Paragraph (c) 13: The articles controlled in this paragraph include ……….and electronics separately. ***This paragraph does not control articles which are not enumerated on the U.S. Munitions List and have been specially designed to be compatible with the articles controlled in this paragraph.***

Cat XII d) (9)

This category captures *"developmental guidance, navigation, or control devices, systems,…"*

We believe that this definition is vague and presents the risk of encompassing any developmental guidance, navigation or control devices, including for commercial aircraft.

Though Note 1 to paragraph (d) (9) states that "This paragraph does not control guidance, navigation or control systems or equipment…..(c) identified in the relevant Department of Defense contract or other funding authorization as being developed for both civil and military applications" ; it is unclear whether a private industry investment would qualify as "other funding authorization"

We suggest that either the language in the description limits to "guidance, navigation, or control devices, systems specially designed for application for Defense Articles" or that the Note clarifies "private or public funding"

Proposed language:

Developmental guidance, navigation or control devices, systems ***for use in or with a Defense Article****, or equipment funded by the Department of Defense…….*

or

Note 1 to paragraph (d) (9): This paragraph does not control guidance , navigation or control, systems ….(c) identified in the relevant Department of Defense control or ***otherwise documented*** *as being developed for both civil or military applications*

General Comment

My comment is to look at what ITAR regulations did to the satellite industry. If this change goes through, the same will happen to the telecom industry and the burgeoning industry for self driving cars. Please review this link for a little history.

Comment 1.

Control (c)(12)(viii) which controls IR camera cores should only control cores with IRFPA having 328,000 detector elements.

Modules having more than 111,000 detector elements are readily available in Germany (http://www.aim-ir.com/en/main/products/modules.html).

Comments regarding the proposed rule "Amendment to the ITAR: Revision of USML Category XII"

Subject: RIN1400-AD32

Summary: Since adequate control criteria do not exist and cannot be positively enumerated, as detailed in the text, the revision should be rewritten with "specially designed for military use"as the fundamental criteria.

Category XII-Fire Control, Range Finder, Optical and Guidance and Control Equipment

Comment: Category XII: paragraph (a)(2)(i)- The text does not offer a'bright line' when it uses the word 'any' to describe specific regulations. The requirement that 'any' infrared focal plane array (IRFPA) having a peak wavelength exceeding 1000 nm that can be used as a weapon sight is confusing. It does not distinguish between a 'photon' IRFPA and a 'thermal" IRFPA nor the pixel density. The former requires an 'active' illumination from an external source. The 'thermal' format utilizes the inherent target temperature. This wavelength specification is a catch-all metric encompassing the entire electromagnetic spectrum beyond one micron. There should be an operational spectral range in describing the wavelength similar to Commerce's CCL controls. Recommendation is to use industry standard nomenclature for SWIR, MWIR, LWIR, and VLWIR (see paragraph (c)(12) comments).

Comment: Category XII: paragraph (c)- The description is overly complicated. "Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:". It includes physical items (e.g. "IRFPA"), applications (e.g. "night vision"), operating wavelengths ("infrared and terahertz systems) and a catch-all term "accessories". A clearer explanation without 'mixing' devices, applications, or characteristics would be advised.

Comment: Category XII: paragraph (c)(2)- This description is confusing with terms like photon detector, microbolometer detector, or multispectral detector appended to infrared focal plane arrays (IRFPA). The point is to have a common metric for the general IRFPA. Presently, the wavelength range 900 nm to 30,000 nm and the mechanical sensor assembly are provided as the key description. However, the wavelength range is in conflict with the greater than 1000 nm wavelength range specified in (a)(2)(i). There is a reference to 'detector elements' without any further description. Finally, a new designation 'permanent encapsulated sensor assembly' is presented; however, it has not been identified. This is the first mention of a new IRFPA commodity description. Recommendation is to generate a dedicated note defining this new assembly.

Comment: Category XII: paragraph (c)(3): The one-dimensional linear photon array with up to 640 elements is incompatible with the Commerce Control List 6A002.a.3.d; 6A002.3.d.1; 6A002.a.3.d.2 and its Technical Note. Addendum 1 lists the appropriate CCL paragraph. The number of array elements is not a critical metric nor is the operating wavelength (absent); however, the element geometry is important. The linear array is available in two geometries: square element and rectangular element. The former can be used in 'imaging' applications where one axis is moving (conveyor belt, moving aircraft). The major conveyor belt application is the recycling industry, food processing industry (almond picking), machine vision, etc. Aircraft applications include remote sensing (fire detection, vegetation, forest canopy). The rectangular element linear array's primary application is spectroscopy (e.g., dispersive & Raman) and instrumentation (e.g., Dense Wavelength Division Multiplexing,). Its geometry is suited to 'slit' spectroscopy and it is not used in imaging applications. It's primary industrial use is in food inspection, agriculture monitoring, moisture measurements, semiconductor process monitor, and biomedical, chemical, pollution, & environmental monitoring. Presently, the major global OEM vendors (Hamamatsu (Japan), Xenics (Belgium), & UTC/Sensors Unlimited (USA)) offer 1024 element square and rectangular SWIR linear arrays. Xenics has announced a commercial 2048 element linear array. All the aforementioned linear arrays are 'permanently encapsulated sensor assemblies'. Recommendation is to revise the 'proposed rule' to focus on 'specially designed for military use' as the principal evaluation parameter in determining ITAR precedent.

Addendum 1.

a.3.d. Non-"space-qualified" linear

(1-dimensional) "focal plane arrays" having all of the following:

a.3.d.1. Individual elements with a peak response in the wavelength range exceeding 1,200 nm but not exceeding 3,000 nm; *and*

a.3.d.2. Any of the following:

a.3.d.2.a. A ratio of 'scan direction' dimension of the detector element to the 'cross-scan direction' dimension of the detector element of less than 3.8; *or*

a.3.d.2.b. Signal processing in the detector elements;

Note: *6A002.a.3.d does not control "focal plane arrays" (not to exceed 32 elements) having detector elements limited solely to germanium material.*

Technical Note: *For the purposes of 6A002.a.3.d, 'cross-scan direction' is defined as the axis parallel to the linear array of detector elements and the 'scan direction' is defined as the axis perpendicular to the linear array of detector elements.*

Comment: Category XII: paragraph (c)(4)- The 'proposed' rule is an egregious misunderstanding to the 2-dimensional (2D) photon based IRFPA development. The recommendation to control area arrays with greater than 256 elements is inconsistent with the technology. This would limit the maximum size of a 2D IRFPA that is not controlled to a 16x16 sensor. There are no commercial products with this type of device. The pixel density is not an indicator to the 'quality' of an IRFPA. Presently, 2D photon IRFPA operating in the SWIR, MWIR, and LWIR are available with greater than 1 million pixels (elements). SWIR focal plane arrays are offered by a number of foreign vendors such as Chunghwa Leading Light (Taiwan), Sofradir (France), Semiconductor Devices (Israel), Hamamatsu (Japan) with pixel density exceeding the proposed 256 elements. All devices are packaged as 'permanent encapsulated sensor assembly'. The manufacturers do not offer 'bare' elements (ROIC or FPA) for commercial sale. Recommendation is to revise the proposed rule for the 2-dimensional (2D) photon based IRFPA described in (c)(4) to eliminate the pixel density, and concentrate on defining 'specially designed for military use' as the key metric. The requirement for a 'permanent encapsulated sensor assembly' allows this item to fall under the CCL aegis.

Comment: Category XII: paragraph (c)(5)- The proposed rule concentrates on a single performance metric (pixel density) without explaining its importance. The 328 000 pixel array limit captures thermal based IRFPA with up to 640x512 sensor (327 680 elements); however, it places USA manufacturers at a disadvantage. Global supplies such as Jenoptik (Germany), ULIS (France) and SCD (Israel) offer 1024x768 (786 432 pixels) offer a 'permanent encapsulated sensor assembly' for global commercial sales.
Recommendation is to remove the pixel density limit, and to specify 'specially designed for military use' for ITAR control.

Comment: Category XII: paragraph (c)(9)(i)- The subset discusses cryocoolers having a cooling source temperature below 218 K. This temperature is equivalent to -55.15 ºC. The National Institute of Standards and Technology has chosen to consider the field of cryogenics as that involving temperatures below −180 °C or −292.00 °F or 93.15 K. This is a logical dividing line, since the normal boiling points of the so-called permanent gases (such as helium, hydrogen, neon, nitrogen, oxygen, and normal air) lie below −180 °C (93.15 K). A cryocooler is a stand-alone vessel that is used to cool some specific application to cryogenic temperatures. It is wrong to classify cooling vessels using the thermoelectric effect as a cryogenic material. This would put unintended controls on any IRFPA mounted in a thermoelectrically cooled module. The 'integrated dewar cooler assembly' (IDCA) is usually classified as a closed-cycle vessel known as a 'Stirling engine' to reach cryogenic temperatures.
Recommendation is to change the text in paragraph (c)(9)(i) from the 218 K source temperature to 93.15 K. This subsection does not clearly explain the rationale for controlling IDCAs at non-cryogenic temperatures.

Comment: Category XII, paragraph (c)(12)- The paragraph is too confusing with its attempt to capture all aspects of infrared imaging within the following topics: image intensifier tubes (catch-all subset without any clear lines between commercial and military (dual-use) applications), IRFPA 'camera cores' covering the SWIR, MWIR, LWIR, and VLWIR electromagnetic spectrum (requires standard nomenclature when discussing spectral wavelengths with respect to photon detection and thermal detection). Presently, (c)(12) uses wavelength bands not associated with the CCL wavelengths. Recommend using the following wavelength definitions:

- Near-infrared: from 0.7 to 1.0 µm (from the approximate end of the response of the human eye to that of silicon).
- Short-wave infrared: 1.0 to 3 µm (from the cut-off of silicon to that of the MWIR atmospheric window). InGaAs covers to about 2.5 µm; the less sensitive PbS photoconductor also cover this region.
- Mid-wave infrared: 3 to 5 µm (defined by the atmospheric window and covered by InSb and HgCdTe and PbSe).
- Long-wave infrared: 8 to 12 µm or 7 to 14 µm (this is the atmospheric window covered by HgCdTe and microbolometers).
- Very-long wave infrared (VLWIR) (12 to about 30 µm, covered by HgCdTe and doped silicon),

Additionally, this section has mixed units confusing photon and thermal imaging, variable pixel density dependent on photon linear array, photon area array, and thermal area array. Confusing references are made to earlier paragraphs mixing dual-use terminology. Pixel density is no more a critical metric in linear/area arrays as is the wavelength band or geometry (square/rectangular/circular). The inclusion of an "integrated dewar cooler assembly' (IDCA) within this category is confusing. There should be a separate paragraph especially since it's unknown the specific operating wavelength band, and IRFPA requirements (photon or thermal excitation). Paragraph (c)(12) titled 'infrared imaging camera cores' misses the essence of this document 'Amendment to the ITAR: Revision of USML Category XII' to provide the 'bright line' between USML and CCL control.

It is further recommended that 'specially designed for military use' be the key metric to classifying an commodity ITAR on the USML.

Addendum: Permanent Encapsulated Sensor Assembly

The clarifications of the EAR/USML items that are undergoing “rule changes” are critical to identifying components. This comment discusses the “sensor” for the proposed amendment to ECCN 6A002 and the revision of the Category XII USML describing “encapsulated focal plane arrays” modules. Infrared Focal Plane Arrays (IRFPA) are categorized into two geometries: linear array (1-dimensional) and area array (2-dimensional). These two items are divided into a “stand-alone” photodiode array, a “stand-alone” photodiode array with a “stand-alone” discrete readout integrated circuits (ROIC), and a hybridized photodiode array physically attached via indium solder to a Si ROIC. These “IRFPA components” are integrated into a “permanent encapsulated sensor assembly” module. Several examples illustrating the area (imaging) array and linear (spectroscopy) array are attached. The end-user is unable to change the photodiode array or readout integrated circuit without damaging the IRFPA module. This sensor assembly should be classified within the Commerce department’s CCL. It would not be within the USML guidelines (unless specially designed). An IRFPA that is not permanently encapsulated would be classified under ITAR control. The first graphic illustrates the photodiode array wafer processed into individual die, and a photograph showing the readout integrated circuit wafer (ROIC). The user could select an optimized photodiode array and to an optimized ROIC; thereby side stepping the proposed rule. These would fall under the USML ITAR designation.

	A 100 mm diameter InP wafer with 26 sensors diced into a 1280 x 1024 InGaAs/InP area photodiode array (PDA). The bare die can be hybridized to any suitable ROIC. This provides the condition for ITAR control.
	A 152 mm diameter Si wafer with readout integrated circuits (ROIC). This Si wafer is diced into ROIC chips. The bare die can be hybridized to any compatible two-dimensional photodiode array. These items fall into ITAR control.

The subsequent graphics illustrate the "permanent encapsulated sensor assembly" for the linear and area focal plane array.

	Xenics (Belgium) XFPA-1.7-640: InGaAs SWIR photodiode array hybridized to Si ROIC and permanently encased to a leadless chip carrier (LCC). The user does not have individual access to either the photodiode array or ROIC.
	Chunghwa Leading Photonics (Taiwan) graphic illustrating its two-dimensional InGaAs SWIR photodiode array hybridized to a Si ROIC. This IRFPA is classified as a 'permanently encapsulated sensor' in an LCC module.
	The Hamamatsu (Japan) model G11097-0707S is a two-dimensional InGaAs SWIR photodiode array hybridized to a Si ROIC. The IRFPA is hermetically sealed in a metal dual inline package (DIP) illustrating the "permanent encapsulated sensor assembly" format. The user does not have direct access to the IRFPA without destroying it.

	The Hamamatsu (Japan) model G12242-0707W is a two-dimensional InGaAs SWIR photodiode array hybridized to a Si ROIC. The IRFPA is hermetically sealed in a TO-8 package. This illustrates the 'permanent encapsulation sensor assembly' construction. The user does not have access to the IRFPA without destroying the item.
	The Sensors Unlimited (USA) Linear photodiode array (PDA) (center) and two ROICs bonded onto a ceramic carrier. This is an example of the stand-alone PDA and stand-alone ROIC. These elements are permanently bonded to the ceramic substrate. Neither the photodiode array (PDA) nor the ROIC can be removed.
	The Sensors Unlimited (USA) Linear photodiode array (IRFPA) submount attached to 14-pin dual inline package (DIP). The IRFPA is fixed within the DIP. The user has no ability to individually change elements without permanent destruction.
	The Sensors Unlimited (USA) 'permanently encapsulated sensor assembly' employing an InGaAs IRFPA assembly. The internal components can't be accessed without catastrophic damage to the IRFPA.

Addendum: 9 Hertz Uncooled Thermal Imaging Camera (UTIC)

. This revision would force the regulation of the 6A993 microbolometer based thermal imaging camera (currently classified as EAR99) back into the aegis of the CCL control. The BIS spent considerable time and effort working with the original equipment manufacturers (OEM) that a reduced frame rate based thermal camera could be separated from the 30 Hz and higher frame rate cameras governed by ECCN 6A003. Through diligent effort the "9 Hertz" uncooled thermal imaging camera was successfully developed, and it was given a 6A993 classification. The global OEM vendors have spent considerable effort to market this low frame rate thermal imaging camera for commercial applications such as fire detection, non-contact thermometry, predictive maintenance, building inspection, advance driver assistance systems, etc. The 6A993 designation immediately 'leveled' the 'playing' field with respect to the international market. The USA manufacturers were no longer at a disadvantage in the international market. It is a disservice to reclassify the "9 Hertz" thermal imager because it might be used in a military application.

Unknown at the time of the original classification was a 'future' application to take this 6A993 commodity into the "consumer" world. Recently, uncooled thermal imaging cameras (based on ECCN 6A003.b.4.b) have been developed as an accessory to the "Smartphone". This is a major event in the 'photonics' industry whereby the thermal infrared operating in the 7 to 12 micron spectrum is accessible to the global 'consumer' market. Global vendors FLIR (USA), Seek Thermal (USA), i3systems (Korea), and Opgal's Therm App (Israel) are currently or are in the process of selling these 9 Hertz thermal imaging cameras that are directly connected to a Smartphone. These 9 Hertz cameras are sold directly through vendors such as Amazon, Best Buy, Home Depot, Walmart, etc. as well as their own websites without any reference to CCL/ITAR. Each of the aforementioned products operate with a 9 Hertz or lower frame rate. They require no formal expertise to operate the camera. Software applications have been developed and are openly available from the Apple and Google platforms to operate the thermal camera with Apple or Android equipped Smartphones. It is a disservice to American industry to place restrictions on this novel consumer product. Additional foreign manufacturers will join this fast growing and global market using the microbolometer based IRFPA manufactured from non-USA sources. It is impossible to know the end-use or end-user when purchasing an accessory for the ubiquitous Smartphone. Consequently, it is unrealistic to attempt to control the 9 Hertz thermal camera because it might be used for a military application.

FLIR ONE F.A.Q.

What is the FLIR ONE?

Available in two new second generation models mid year, FLIR ONE is a thermal camera that attaches to Android or iOS devices that visualize the otherwise hidden world of heat. Equipped with an enhanced Lepton thermal camera core, the FLIR ONE combines visible and thermal images together using a patented technology called MSX to make the thermal image crisper and more recognizable. Everything around us is either emitting or reflecting thermal energy and with the ability to see it and measure it on a mobile device, we can interact with and understand it in useful, interesting and fun ways. FLIR ONE extends human vision. It is the new sixth sense.

How are the new FLIR ONEs better than the original?

Available in either iOS or Android hardware versions, FLIR ONE features:

- A more powerful thermal sensor with four times the resolution for crisper and clearer thermal images.
- Automatic tuning. There is no need to manually tune the device for optimum use.
- A lighter-weight design that is less than a third the weight of the original.

The device retains its own dedicated battery and has the side-by-side visible and thermal cameras. When combined through MSX, the software dramatically increase a user's ability to interpret a thermal image in real-world environments.

How should I refer to the new FLIR ONE?

Two new second-generation FLIR ONE models will be available. One compatible with Android phones that use the Micro USB interface, and one for Apple iOS devices that use the Lightning connector. These products will be known as ***FLIR ONE for Android*** and ***FLIR ONE for iOS***, respectively. Refer top the original FLIR ONE as the first generation FLIR ONE.

What is the price point of FLIR ONE?
FLIR ONE is available worldwide for MSRP $249.99 U.S.

What is the launch date of the next-generation FLIR ONE? When will it ship?
As of June 25, 2015, the FLIR ONE is available for purchase worldwide through FLIR.com/FLIRONE.

How can I purchase FLIR ONE?
In addition to purchasing through FLIR.com/FLIRONE, availability at Amazon, Apple.com and BestBuy.com is expected in July followed by worldwide a roll out in major retailers during the calendar-year third quarter, including The Home Depot and Best Buy.

I'm a dealer/store owner and would like to sell FLIR ONE. Who do I contact?
If you are interested in becoming a channel partner for FLIR ONE, please contact Keith Geck at Keith.Geck@FLIR.com.

Which mobile devices are compatible for use with this generation of FLIR ONE?
The latest generation of FLIR ONE is compatible with Android products with a micro-USB and Apple products with a lightning connector, including the Nexus 6, Samsung Galaxy S6, iPhone 6, 6 plus and iPad, among other devices.

With this new version, how long will you offer the FLIR ONE case for iPhone 5/5s?
The FLIR ONE case will continue to be offered for sale through FLIR.com. We will provide guidance on how long we will continue to sell the first generation FLIR ONE at a later date.

What is FLIR doing to encourage app development?
The FLIR ONE Developer Program is an entire campaign dedicated to enabling developers to create innovative and useful apps for the FLIR ONE. Developers are encouraged to join the program to gain access to FLIR ONE development tools, resources and training to become a FLIR Certified Developer. The new FLIR Approved Applications program gives developers access to additional resources and tools to make their apps as compelling as possible and gives consumers some assurance that apps bearing the FLIR Approved Applications badge have been reviewed by FLIR and deliver thermal imaging benefits to consumers.

Where can I get the FLIR ONE SDK?
An updated FLIR ONE SDK for the iOS platform is available at http://www.flir.com/flirone/developer, which is compatible with the original FLIR ONE and the new FLIR ONE for iOS. A new SDK for FLIR ONE for Android is in beta now and will be publicly available in July. With the FLIR ONE SDKs, developers have access to absolute temperature data for all pixels and control the Lepton camera's shutter mode, in both manual and automatic settings.

For information on this program, contact Cal Loo at cal.loo@flir.com.

What other benefits does FLIR provide the developer community?
The FLIR Certified Developer program offers interested developers specific training in thermal imaging technology and the use of the FLIR ONE developer tools, as well as additional technical and business support to bring apps to market. Once certified, the developers can market themselves as FLIR Certified Developers using the FLIR Certified Developer badge (below). The developer may also be included in the FLIR Developer Universe featured on the FLIR developer website in addition to being eligible for app development business leads from FLIR.

The FLIR Approved Applications program offers developers access to additional resources and tools to make their respective apps as compelling as possible. It also provides consumers assurance that apps bearing the FLIR Approved Application badge have been reviewed by FLIR for quality and value.

Those apps that qualify may be marketed using the FLIR Approved Application badge (below) and may be included in the FLIR ONE applications gallery on the FLIR developer website and included in the "Feature App" listing. Additional benefits include the possible complementary promotion on FLIR.com and FLIR-owned social media channels.

While FLIR can't assume responsibility for the apps developed by any independent developers, this program offers consumers assurances that apps bearing the FLIR Approved Applications badge are of good quality and offer thermal imaging value to customers.

FLIR APPROVED APPLICATION

FLIR CERTIFIED DEVELOPER

What is FLIR doing to recruit developers to the FLIR Developer Program?
FLIR recently launched the "Bring the Heat" event campaign, which is a series of hacker and maker challenge events set around the world. At these events, software developers come together in the spirit of collaboration and competition to brainstorm thermal imaging-related ideas and to evolve them into real applications for cash and product prizes. FLIR provides the venue, the hardware and software tools along with mentoring and technical support. Developers provide the smarts, the ingenuity and passion to create great apps.

For more information, check out the events page at http://www.flir.com/flirone/developer.

What if I can't physically attend and participate one of the "Bring the Heat" hacker challenge events?
We want to include and encourage developers all over the world to bring their creative ideas and skills to FLIR ONE. In the near future is launching a global, online Bring the Heat hacker challenge. Developers will be able to register on ChallengePost, develop and test their apps using either a physical FLIR ONE device or an online simulator, and submit their respective apps online to compete for cash and product prizes.

Stay tuned for more information at http://www.flir.com/flirone/developer.

What apps will be available for use with FLIR ONE?
The primary FLIR ONE app has been updated with the introduction of the new FLIR ONE models and is available for free download on the Apple App Store and the Google Play Store. Additionally, FLIR is working with multiple flagship developers through the FLIR Developer Program to create apps that address specific user groups with features and capabilities that suit a variety of needs.

Some examples of the many new apps that are or will soon be available, include:

- **Comfort Tracker:** guides homeowners and professional contractors through a home energy assessment to identify opportunities to improve comfort and efficiency by recommending solutions and identifying local retailers of Owens Corning insulation.
- **Manything:** a free app that turns spare iOS devices into video monitoring cameras and has integrated the FLIR ONE to enable remote thermal vision, temperature triggered alerts and thermal motion detection, even in total darkness.
- **Zombie Vision:** turns your FLIR One enabled mobile device into a fun, real-time Zombie locator.
- **Everfave:** Innovative iOS and Android app for consumers to discover and share recommended businesses and pros. Consumers earn rewards for sharing their experiences and recommendations with their friends.
- **Infrahorse:** aides horse enthusiasts in determining 'hotspots' or asymmetry in a horse's legs, hooves or back that may denote a potential health issue.

What would I use FLIR ONE for?
Thermal imaging makes the otherwise invisible world of heat energy visible to your eyes. Everything around you either emits or reflects heat energy. For example, with FLIR ONE, when you look around a room in your home, you can see where doors and windows are not well insulated. You might see a wall switch is slightly warm that could indicate a pending problem or overloaded circuit. The list of uses is long and will grow dramatically as customers discover this unseen portion of the electromagnetic spectrum. Visit FLIR.com/FLIR ONE for educational information on how thermal imaging can and will be useful in everyday life, and discover this previously invisible world first-hand.

I'm concerned about privacy. Can someone use FLIR ONE to spy inside my home or underneath clothes?
FLIR ONE does not provide x-ray vision. It allows you to visualize and measure the surface temperate of most objects. In many cases, the surface temperature of an object can be affected by things behind or under the surface. For example, under certain conditions the surface temperature of a wall can be subtly affected by the wooden studs behind it. This characteristic can allow you to easily see the location of the studs behind the wall, without actually looking through the wall.

Aren't you concerned FLIR ONEs can be used to steal personal information? Like an ATM pin code?
With any new technology in the hands of consumers, there is a chance it will be used in unintended ways. At FLIR, our heritage is to provide the world's most advanced thermal imaging technology for public safety, environmental protection and to enhance our daily lives. Therefore, we take personal security very seriously.
The purported ability to steal pin codes with thermal imaging cameras, such as at ATMs, requires very specific conditions and circumstances making such a scenario highly unlikely. Regardless, we recommend practicing prudent identity protection measures to ensure personal data remains secure no matter the situation.

What is the indoor/outdoor range of FLIR ONE?
At about 100 feet, you can see the heat signature of a person. However, atmospheric conditions can influence the visible range. Dry, clear weather will provide a greater range than rainy, foggy, or humid conditions as water in the atmosphere can absorb infrared radiation before it reaches the sensor.

What is the resolution of the camera?
Resolution is often synonymous with image quality, but in reality, resolution is one of many factors that determine thermal image quality. The new FLIR ONE's more powerful Lepton thermal camera has been upgraded to generate image quality equal to or better than the original in every respect. When combined with the VGA visible camera, FLIR ONE creates a crisper and clearer 640x480 image than ever before. This is achieved with FLIR's patented two-camera MSX™ Technology, which embosses a visible image onto the thermal image without eliminating any thermal information, greatly enhancing the perceived resolution and detail of the thermal image.

How does MSX blending work?
FLIR developed MSX blending as a proprietary and patented technique to improve image quality. It dramatically increases a user's ability to interpret a thermal image in real-world environments by adding visible edge detail to a thermal image without sacrificing detail. MSX is additive in that no thermal information is lost, greatly enhancing the perceived resolution of the thermal image. However, MSX only works in conditions where visible light is present. In dark conditions, turn on the companion-device flashlight to generate light.

Does the FLIR ONE require frequent manual tuning of the shutter to ensure the best experience?
No. The new FLIR ONE now features automatic tuning and thus will not require the user to periodically reset the thermal sensor.

What is the operating temperature for the FLIR ONE?
FLIR ONE operates at 32°F to 95°F (0°C to 35°C). It also features an enhanced scene temperature range of -4°F to 248°F (-20° to 120°C), a 40°C increase in range from the predecessor device.

Will there be a new FLIR ONE that wraps around my mobile device like the previous version?
Because this generation of FLIR ONE is a small and lightweight attachment to mobile devices through either a micro-USB (Android) or a lightning connector (Apple), it provides the user flexibility to use FLIR ONE with multiple device types.

How is the new FLIR ONE powered? Will it drain my tablet/smartphone battery?
No. The attachment includes an internal battery, ensuring that the FLIR ONE won't drain the respective battery of the attached device.

The FLIR ONE adds some bulk and weight to the mobile device. Will it still fit in a pants pocket?
FLIR ONE weighs just 2.75 ounce (~30 grams), which is less than a third the weight of the predecessor. With its small and lightweight form factor, it adds just 0.7 inches (18 mm) of depth and about 2.8 inches (72 mm) in length when attached to an Android smartphone or the iPhone 6, as examples.

Therm-App
more to see.

ANDROID THERMAL IMAGING DEVICE

Unparalleled combination of excellent performance and affordability in a portable, lightweight device

Why Stay in the Dark?

Therm- App™ improves effectiveness in the field, providing clear images in total darkness — delivering mission critical information which can save lives. The compact and lightweight camera with interchangeable lenses enables users to record and immediately share high-quality thermal images and videos. Connecting to most Android smartphones, it offers superb image quality and low power consumption.

Long range detection

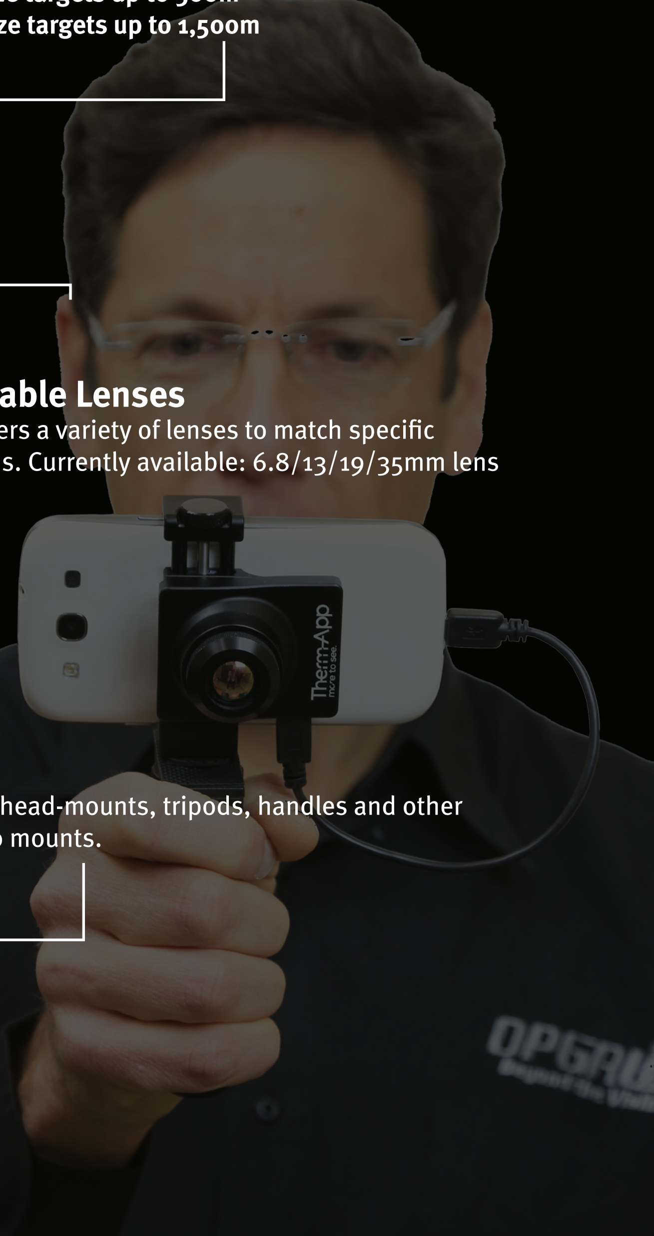
Detect human size targets up to 500m
Detect vehicle size targets up to 1,500m

Interchangeable Lenses

Therm-App™ offers a variety of lenses to match specific operational needs. Currently available: 6.8/13/19/35mm lens options.

Modular

Compatible with head-mounts, tripods, handles and other standard 1/4"-20 mounts.



Improve situational awareness and enhance safety with long-range detection and recognition capabilities.

Security

See the unseen while on routine perimeter patrol, securing a facility, or identifying potential threats in dark or badly lit areas. It's easier to control and secure a perimeter, by obtaining clear images of people, animals, or vehicles at the scene.

Law Enforcement

Improve situational awareness and enhance safety while on patrol, responding to distress calls, exiting patrol vehicles, and entering buildings. Identify perpetrators trying to avoid detection or fleeing the scene.

Wildlife

Obtain a clear view of animals in the wild, irrespective of lighting or weather conditions— through high grass, dense brush, or forested areas.

Search and Rescue

Locate injured or unconscious people on land or in water, in any weather or environmental conditions such as fog or smoke. Detect signs of life even in thick foliage or wooded areas, day or night.

Therm-App™ Technical Specifications

Smartphone	
Minimal Requirements	Android 4.1 and above, supporting USB OTG
Hardware	
Imager	384 x 288 microbolometer LWIR 7.5 -14um
Optics	6.8mm lens (55° x 41°) 13mm lens (29°x 22°) 19mm lens (19°x14°) 35mm lens (11° x 8°)
Focus	Manual, 0.2m to infinity
Frame Rate	8.7Hz
Weight	138 grams / 4.86 ounces
Size	55 x 65 x 40mm (2.16 x 2.55 x 1.57in)
Operating Temperature	-10°C to +50°C (14°F to +122°F)
Storage Temperature	-20°C to +50°C (-4°F to +122°F)
Power Supply	No battery, 5V over USB OTG cable, power consumption < 0.5W
Certifications	CE, FCC, RoHS
Encapsulation	IP54
Mount/Handle	Ergonomic handle, using 1/4"-20 standard tripod mount
Device Attachment	Clip-on for smartphone (5 -10cm span)

Measurement	
Resolution	384 x 288 pixels (>110,000 pixels)
Accuracy	+/- 3°C or 3% (@25°C)
Sensitivity	NETD <0.07°C
Temperature Range Calibration	5 – 90 °C
Software	
Viewing Modes	• Night Vision • Thermography (Basic)
Output	Video & Audio (h.264), Snapshot
Instant Share	Email, SMS
Android Share	Via media gallery
Color Palettes	Hot White / Hot Black / Iron / Rainbow / Grey / Vivid
Zoom	Continuous digital zoom using touchscreen
Software and feature updates	Yes (via Google Play)
Maintenance	Bad pixel repair uilitity

[At night, or in poor visibility conditions, Therm-App™ gives you the full picture.]

i3system Shows Hi-Res Device at SPIE-DSS 2015

Thermal Expert Prototype At SPIE.DSS 2015

Baltimore MD, USA â€” i3system showed a prototype high resolution (>110,000 pixels) Smartphone LWIR Thermal Imager named ***â€œThermal Expertâ€.***

It appears intended to compete with the FLIROne and Seek Thermal products already on the market.

i3system already produce LWIR microbolometers in-house with 384X288 @ 25 Âµm pitch having NETD of <50 mK.

Their LWIR engine reportedly draws less than 3 Watts.

i3system Thermal Expert (right) on Smartphone

Could be some more bang for the buck than the lower-priced and lower performance devices already out there. Just check the image on the iPhone to the left!

The next year should see some very interesting developments, to say the least!

i3system is no lightweight in the field of thermal imaging.

They have been developing and selling high-tech imaging sensors in Korea for more than 15 years.

They now also are expanding their commercial business with IR detector and camera electronics for satellite and other applications.

i3system, Inc, founded in 1998, has developed capsule endoscope for medical use and cooled infrared detectors for thermal imaging cameras for Korean military use. We later expanded our business to X-ray imaging detectors for dental X-ray imaging equipments such as panoramic and cephalometric systems. i3system, inc. is officially designated as a military product contractor for Korean military since 2010 by Korean government.We also develop and manufacture uncooled IR detectors for uncooled thermal imaging cameras for commercial products such as security, surveillance, radiometry devices and night vision systems as well as military product for personal rifle of Korean Army. Our products for military use include IR scene projector, real time scene simulator, IR camera and laser detector.

Seek Thermal Camera

With its wide field of view, the original Seek Thermal camera is perfect for use indoors and around the house.

This camera allows:

- **Contractors** to see water damage, air leaks, missing insulation, and other energy inefficiencies

- **Home owners** and DIYers to conduct a home energy audit to help save on their energy bill
- **Plumbers** to detect water leaks and clogs
- **Electricians** to identify electrical shorts, loose wiring, and other safety hazards
- **Pet owners** to locate lost pets at night or in obscured visibility conditions

36° Field of View

-40C to 330C Detection Range

Protective Waterproof Case

BUY FOR IPHONE

BUY FOR ANDROID

Seek Thermal XR - Xtra Range

The Seek XR is an extended-range version of our award-winning thermal camera. With nearly twice the magnification, the Seek XR lets you see objects at greater distances with the same clarity and resolution as the original Seek camera.

206 x 156 Thermal Sensor

20° Field of View

-40C to 330C Detection Range

Protective Waterproof Case

BUY FOR IPHONE

BUY FOR ANDROID

This model is ideal for:

- **Hunters** to track game, scout terrain, and follow bloodtrails
- **Boaters** to detect harmful objects on the water at night
- **Campers** to quickly scan around a campsite for dangerous animals
- **Electrical Engineers** to inspect components, circuit boards and assemblies
- **Anyone** looking for increased home security can detect intruders from nearly 1,800 feet away

General Comment

Response to ITAR Amendment Category XII (b)(13)(i)

See complete comment in the upload, Response to Section (b)(13)(I) of ITAR -7-3-15 Final. Docx, which includes detailed
technical discussions and examples in the appendix.

3 Conclusion
The Section (b)13(i) of the amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List
Category XII would control most of todays commercially used laser stacked arrays and as a consequence any commercial
product using these arrays by the see through rule. The proposed peak pulsed power density limit of 3,300 W/cm2 is
much too low to be able to draw a bright line between military and non-military products and in addition one parameter,
power density, is not adequate to distinguish military products from commercial products. Laser stacked arrays as defined
in (b)(13)(i) are produced and in commercial use around the world and therefore do not provide a critical military or
intelligence advantage to the US. On the contrary, US industry that produces laser stacked arrays or utilizes them in

products like medical or material processing devices for example, would be adversely affected by this limit: They would be
excluded from a growing market and lose market share to, or be put out of business by, international competitors.
4 Proposal for Revised Language:
Proposal 1: delete XII(b)(13)(i) as being inappropriate and too poorly parameterized for ITAR control
Proposal 2: Amend XII(b)(13)(i) to read: laser stacked arrays having an output wavelength not exceeding 1,400nm
and a peak pulsed power density greater than 100,000 W/cm2, if specially designed for military applications

---

Response to Section (b)13 of ITAR - 7-3-15 final

Response to "ITAR Amendment – Category XII" (b)(13)(i)

1 Introduction

1.1 Commenting Organization: ASC

Advanced Scientific Concepts, Inc. (ASC) was founded in 1987 to develop emerging technologies specifically related to enhanced imaging and imaging applications. The company's current focus is 3D Flash LIDAR™ technologies and cameras. The "framing camera" nature of ASC's cameras and its real-time 3D video output makes them ideal for moving-vehicle solutions such as automotive and aviation collision avoidance and navigation systems. All ASC's cameras operate as eye-safe, time-of-flight laser flash systems. As a sub-component for laser pumping are laser stacked arrays of 808nm wavelength where peak power densities between 6.3 and 14 kW/ cm^2 are used. Taking advantage of the increased power density of laser staked arrays in ASC's lasers is one of the company's primary means of maintaining competitiveness in the market.

1.2 Summary of concern

We are concerned with the entry in Category XII(b)(13)(i): "laser stacked arrays having an output wavelength not exceeding 1,400nm and a peak pulsed power density greater than 3,300 W/cm^2".

This entry is overly restrictive because it puts today's standard laser stacked arrays, used for a wide range of non-military, commercial laser applications, under ITAR control. Laser stacked arrays with peak power densities more than 24,000 W/cm^2 are already commercially available in the USA and overseas. The current commercial diode market is moving towards higher energies in smaller packages at lower cost which also opens new application possibilities. If the US diode fabrication industry, as well as the industries that implements these arrays in a variety of applications – like the applications in Section 2.2, Table 2 for example - is controlled under ITAR, they will be excluded from a growing market. ITAR controls on U.S.-origin components that are widely available from many countries around the world, including those which do not share U.S. foreign policy and national security objectives, cannot be effective in denying foreign access to the technology. Where the technology is in widespread civil use, ITAR controls compound the competitive harm to U.S. manufacturers by creating enormous legal risks for manufacturers and potential customers alike, but with no corresponding national security benefit. Furthermore most businesses require investment to grow but the risks and insecurity posed by ITAR control are understandably anathema to commercial-technology investors. Therefore, as seen in Section 4 below, we propose to remove the (b)13(i) entry altogether or raise the power density limit to 100 kW/cm^2,if the devices are specially designed for military applications.

2 Discussion

2.1 Commercial availability of laser stacked arrays

Section (b)(13)(i) of the amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII would control any diode stack array with an output wavelength not exceeding 1400 nm and a peak pulsed power density exceeding 3.3 kW/ cm^2. The commercially available peak power limit of such diode stacks has grown by more than 500% in just a few years as can be seen in Figure 1. Diode arrays with an output power of 300 – 400 W per bar (many bars can comprise a laser stack array) of 1-3 mm length are todays standard, while development continues with the goal of higher power at lower cost. Power output of 1kW/bar has already been achieved [1]. However, exceeding power of ~500 W per bar reaches physical limits and reduce reliability and lifetime of the product. The growing power trend for this particular type of diode array will probably stop somewhere between 500 and 1000W/bar maximum for commercial products. Higher energies might be expected for special high power applications that are not looking for a high number of shots and long lifetime. These might include military applications. Lifetime then is obviously an important performance parameter. Conversion efficiency from electrical to optical energy is also a important performance parameter especially for military equipment run by batteries. Additionally size or dimensions of the laser staked array are important particulary for efficiently pumping small oscillator crystals. Hence (b)(13)(i) inadequately parameterizes the technology to distinguish military applications from commercial applications. Using "specially designed for military applications" in the controls can compensate for inadequate parameterization.

As shown in Figure 1, laser power density is increasing at an exponential rate in a manner consistent with the growth of the semiconductor industry as described by Moore's Law.

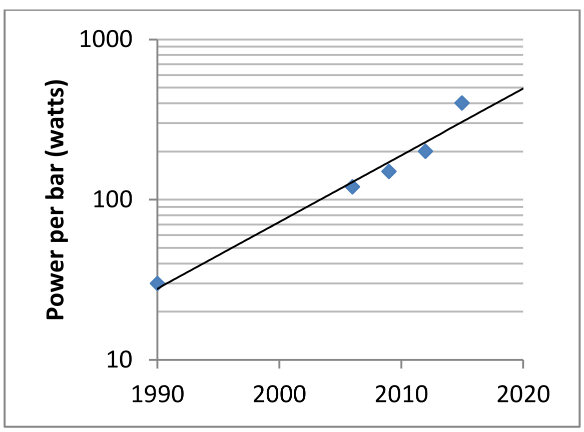

Figure 1: Technology development of laser diodes plotted as the power output per bar since the 1990's and interpolated into the future. Source of values [3].

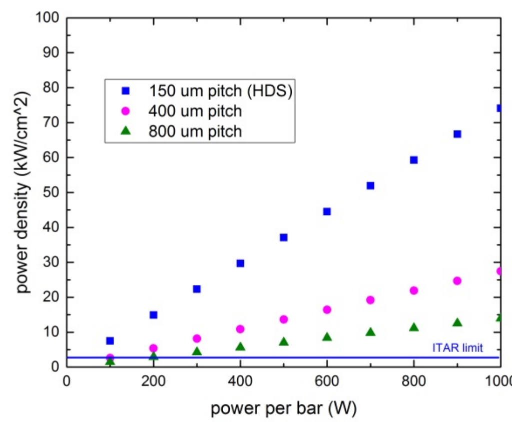

Figure 2: Expected power density of stacked diode arrays depending on package pitch (distance between bars) and power output per bar. It is shown that the proposed ITAR power density limit is at the lower end of the technical standard and would control almost all available stacked products. Values up to 400 W/bar are taken from [2] and then interpolated.

With dense packaging, the peak power density limit of 3.3 kW/ cm^2 is easily exceeded (see Figure 2) as has been demonstrated by Northrop Grumman Cutting Edge Optronics in "Application Note #15" [2]. The proposed peak power limitation would inadvertently control items on the ITAR that are in normal commercial use and are available from vendors around the world including such countries as USA, China, Europe and Japan, to name a few. Specific examples can be seen in Table 1 below. Exemplary data sheets are presented in the appendix, Section 6. To bring the proposed ITAR in line with current commercial offerings and to keep the ITAR from burdening US companies it is recommended that the limit for peak power density of a diode stack be raised to 100 kW/cm^2, if specially designed for military applications.

Country of origin	**Company**	**Peak power density**	**Wavelength**	**Source website**
China	Focuslight	18 kW/cm^2	800-980 nm	http://www.focuslight.com.cn/administrator/img/20141017121282994.pdf

Table 1: List of examples of currently available commercial diode stacks.

2.2 Commercial application of laser stacked arrays

Typical commercial applications for such diode stacks include: illumination, hair removal, and solid state laser pumping. An overview can be seen in Table 2. Having laser stacked arrays controlled by ITAR would exclude US diode and laser vendors from international markets in these fields of application.

Diode stack application area	Operating wavelength (nm)
Medical photodynamic therapy	630 - 730
Hair removal, tattoo removal	810
Pre – Press, computer to plate printing	830
Medical	1064
Acne treatment	1450
Turbulence Detection (aviation)	1850
Plastic welding & material processing	1850
Coagulation of Protein (Medical)	1900 - 2000

Table 2. List of commercial application examples for high power laser diodes and arrays (source [4]).

3 Conclusion

The Section (b)13(i) of the amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII would control most of today's commercially used laser stacked arrays and as a consequence any commercial product using these arrays by the "see through" rule. The proposed peak pulsed power density limit of 3,300 W/cm^2 is much too low to be able to draw a bright line between military and non-military products and in addition one parameter, power density, is not adequate to distinguish military products from commercial products. Laser stacked arrays as defined in this section are produced and in commercial use around the world and therefore do not provide a critical military or intelligence advantage to the US. On the contrary, US industry that produces laser stacked arrays or utilizes them in products like medical or material processing devices for example, would be adversely affected by this limit: They would be excluded from a growing market and lose market share to, or be put out of business by, international competitors.

4 Proposal for Revised Language:

Proposal 1: delete XII(b)(13)(i) as being inappropriate and too poorly parameterized for ITAR control

Proposal 2: Amend XII(b)(13)(i) to read: "laser stacked arrays having an output wavelength not exceeding 1,400nm and a peak pulsed power density greater than 100,000 W/cm^2, if specially designed for military applications"

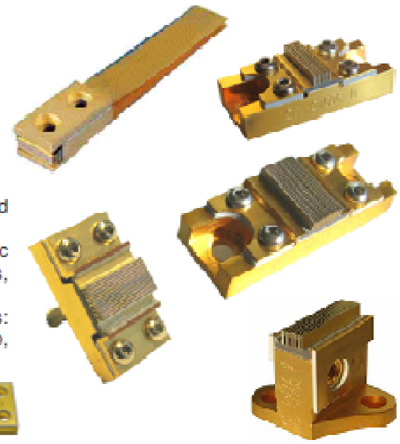
Quantel laser diodes

Conduction-cooled QCW Stacked Array

QD-Q1yzz-A / QD-Q1yzz-B / QD-Q1yzz-BS / QD-Q1yzz-G / QD-Q1yzz-K

DESCRIPTION

QD-Q1yzz-A, QD-Q1yzz-B, QD-Q1yzz-BS, QD-Q1yzz-G and QD-Q1yzz-K are a variety of conductively cooled laser diode stacked arrays. These Stacks can be built from 1 to 19 diode bars of 60W QCW to 400W QCW.
The laser diode bar arrays benefit from a fully mastered technology, with the appropriate design for improved efficiency and reliable operation.
Packaging and heat-sink have been optimized to reduce the overall thermal resistance. Assembly in a compact and rugged package, using AuSn hard solder, allows easy connection to a heat exchanger to get good thermal control.
This technology of stacks has been successfully submitted to specific environmental tests requested for Space missions (long life-tests, endurance under vacuum, irradiations…) with NASA or ESA.
These stacks are ideal for different applications under severe conditions: pumping rods or slabs solid state lasers, illuminators...for aerospace, industrial, space applications.



MAIN FEATURES

- QCW operation
- 60W to 400W QCW per diode bar
- Standard wavelength: from 790 to 980 nm
- Vacuum qualified technology
- Low thermal resistance assembly
- Mechanically robust, shock and vibration resistant

x =	1	2	3	4	5	6

High-power Laser Diode Bar Module L11398-16P980

Data sheet [160 KB/PDF]

With their emitting areas arranged in line to make a linear array, LD bar modules achieve high performance, high output power and high reliability when coupled with cooling devices. When stacked, the output power can be as high as a few kilowatts. There are primarily three cooling methods: the compact and simple Peltier-type Open Heatsink(OHS); the more efficient Water cooling, and Hamamatsu's original Funryu cooling (highest cooling efficiency). The appropriate cooling method should be selected in accordance with the required output power, driving conditions, and application. Fiber output modules are also available.

CEO has combined its novel packaging capabilities with its high power QCW laser diode bars to create conductively-cooled laser diode arrays with power densities approaching 25 kW/cm2. These High Density Stack (HDS) arrays are excellent candidates for small, lightweight applications which require maximum diode intensity in the smallest possible area. These arrays are available over a wide range of standard wavelengths, and can be packaged on nearly all CEO laser diode array platforms, including G, Cs, and Derringer packages. This package is also available with mini-bars that are less than 1 cm in length.

Golden Bullet (hard solder) 5-bar mini G Package option is shown.

General Comment

Discussion on Proposed Category XII(c)(2).

Note: The complete comment appears in the uploaded Word file, Category XII Comments IRFPA F, and the Word attachments
1-3. Only half attachment 4 for the Bosch LRR3: 3rd generation Long-Range Radar Sensor could be uploaded.
but it can be found on internet.

The rule should be revised because it is too general, using wavelength as the only performance parameter. Wavelength
alone is inadequate to define a military IRFPA. From the beginning of ECR, much has been made of the need
to establish a clear bright line between civil and military products, and their corresponding controls. A control using
wavelength as its sole performance parameter cannot succeed in drawing a clear bright line that accurately describes
IRFPAs which warrant control on the USML and those in widespread commercial use.

IRFPAs Captured by (c)(2) are in normal commercial use in a broad range of civil applications, and are available from many
countries. As was noted in the Bureau of Industry and Security's report Critical Technology Assessment: Night Vision Focal
Plane Arrays, Sensors, and Cameras, (October 2012) the commercial market for IRFPAs is growing by leaps and bounds

with a growing diversity of international suppliers. For example, as can be seen in Attachment 1, Zenics (a Belgian company)
provides high-sensitivity, cooled, InGaAs IRFPAs, recommended by the manufacturers for night vision applications as a
commercially available product. Xenics also has a large assortment of uncooled lower sensitivity InGaAs IRFPAs available
for various commercial uses (Attachment 2). Some InGaAs IRFPAs on the Xenics website are advertised as dual use,
non-ITAR cameras. Similar IRFPAs are available from companies in Taiwan (Attachment 3) and many other countries.
The existence of these IRFPAs shows that many IRFPAs are true dual-use technologies of the sort the Commerce Control
List was created to hold. The USML is best suited for true military-only technology.

As mentioned above, a principal goal of ECR is a well-defined bright line between military and non-military technologies.
Unfortunately, as proposed (c)(2) captures almost all IRFPAs with the stated spectral range without regard to whether they
are sensitive enough to actually be used to detect the low signals required of night vision detectors. As should also be clear
from above discussion the technology to make InGaAs devices is in widespread use in civil commercial applications, is
definitely not unique to the USA, and should not be considered a crown jewel technology. Placing ITAR controls on InGaAs
IRFPAs as a class, without greater technical specification to separate military systems from those in ordinary commercial use,
will do nothing to prevent anyone outside the United States from acquiring the technology. It will, however, further savage the
U.S. industrial base.

If on additional review it proves impractical to adequately define the bright line between civil and military products, alternative
options utilized elsewhere in ECR, that could be adapted for use with IRFPAs include a revision to exclude IRFPAs used in
civilian LIDAR, including civil automotive LIDAR. In the alternative, conforming controls on IRFPA to similar usage in the
Wassenaar Agreement Munitions List, and in other ITAR categories revised under Export Control Reform, it could control
only those IRFPAs specially designed for military applications. If the government determines that these carve outs are too
broad, that only serves to highlight the importance of more carefully defining the performance criteria that defines the bright
line between civil and military IRFPAs.

Proposal for Revised Language.

Amend the Note to paragraph (6)(6) by striking 200 and replacing it with 250.

Amend the Note 1 to paragraph (c)(2) to include the clause: IRFPAs used in automotive or civilian LIDAR are not subject to the ITAR.

Add a Note to paragraph (e)(3) stating Paragraph (e)(3) does not control wafers incorporating structures for a ROIC
specially designed for civil automotive LIDAR.

Amend the Note to paragraph (e)(4) adding a statement that ROICs specially designed for civil automotive LIDAR are not
controlled by paragraph (e)(4).

Add a Note to Paragraph (e)(5) stating Paragraph (e)(5) does not control ROICs specially designed for civil automotive
LIDAR.

Alternative Language for Paragraph (c)(2).

Amend paragraph (c)(2) to read: Photodetector, microbolometer detector, or multispectral detector IRFPAs specially
designed for military applications and having a peak response within the wavelength range exceeding 900nm but not
exceeding 30,000 nm

Category XII Comments

Discussion on Proposed Category XII(c)(2).

The rule should be revised because it is too general, using wavelength as the only performance parameter. Wavelength alone is inadequate to define a military IRFPA. From the beginning of ECR, much has been made of the need to establish a clear "bright line" between civil and military products, and their corresponding controls. A control using wavelength as its sole performance parameter cannot succeed in drawing a clear bright line that accurately describes IRFPAs which warrant control on the USML and those in widespread commercial use.

In general, the proposed control in (c)(2) corresponds to only one point in an eight-dimensional space which defines the universe of IRFPAs; military IRFPAs separated by one or more seven dimensional surfaces from commercial IRFPAs (a red surface the analog of the ECR red line). In fact, it takes at least eight parameters to adequately characterize the performance capabilities of an IRFPA (pixel pitch, pixel format, dark current, temperature of operation, quantum efficiency at the critical wavelengths, fill factor, input capacitance and response frequency). Only IRFPAs which pass certain performance thresholds in each parameter are militarily useful. Many IRFPAs which fall below the threshold of military grade nevertheless have significant civil uses. Under the proposed rule, however, IRFPAs which have poor performance in any of these parameters, and which might well be completely useless for almost any application, would still be captured as defense articles. For IRFPAs whose parameters are not within the space defined by these eight parameters as military grade, ITAR control is overbroad. For those IRFPAs whose performance in these eight parameters is so poor as to make them useless, ITAR control is ludicrous.

More specifically, the focus of this comment is on IRFPAs operating in the 900 to 1700 nm spectrum which are associated with civil collision avoidance LIDAR using InGaAs IRFPAs which are captured under the proposed Category XII(c)(2). We urge the Directorate of Defense Trade Controls ("DDTC") to craft a control which fosters development of U.S. industry to meet widespread commercial demand for IRFPA as components in civil LIDAR systems, including civil automotive collision avoidance systems. We strongly believes that this can be accomplished by either drafting a control based upon the eight above identified performance criteria, or by broadening the carve out for specific civil use cases within Note 1 to paragraph (c)(2). Other portions of the proposed rule are also overbroad as drafted, including controls on readout integrated circuits in (e)(3), (e)(4) and (e)(5). We believe that the excessive breadth of these provisions can be partially cured by a more precisely defined control in (c)(2) IRFPAs, but it would be helpful to clarify in a Note to paragraph (e)(3) that "Paragraph (e)(3) does not control wafers incorporating structures for a ROIC specially designed for civil automotive LIDAR." Similarly, the Note to paragraph (e)(4) should add a statement that "ROICs specially designed for civil automotive LIDAR are not controlled by paragraph (e)(4)." A new Note to Paragraph (e)(5) should state "Paragraph (e)(5) does not control ROICs specially designed for civil automotive LIDAR."

It is worth noting that the control implicitly recognizes that (c)(2) is overbroad, in that Note 1 to Paragraph (c)(2) excludes IRFPAs based upon certain materials. While marginally helpful, this material-based carve out is insufficient to adequately characterize the eight parameter performance criterion of an IRFPA's capability.

In addition to more precisely defining the eight relevant performance criteria that define military IRFPAs, we urge DDTC to consider foreign availability. ITAR controls on U.S.-origin components that are widely available from many countries around the world, including those which do not share U.S. foreign policy and national security objectives, cannot be effective in denying foreign access to the technology. Where the technology is in widespread civil use, ITAR controls compound the competitive harm to U.S. manufacturers by creating enormous legal risks for manufacturers and potential customers alike, but with no corresponding national security benefit.

IRFPAs Captured by (c)(2) are in normal commercial use in a broad range of civil applications, and are available from many countries. As was noted in the Bureau of Industry and Security's report "Critical Technology Assessment: Night Vision Focal Plane Arrays, Sensors, and Cameras," (October 2012) the commercial market for IRFPAs is growing by leaps and bounds with a growing diversity of international suppliers. For example, as can be seen in Attachment 1, Zenics (a Belgian company) provides high-sensitivity, cooled, InGaAs IRFPAs, recommended by the manufacturers for night vision applications as a commercially available product. Xenics also has a large assortment of uncooled lower sensitivity InGaAs IRFPAs available for various commercial uses (Attachment 2). Some InGaAs IRFPAs on the Xenics website are advertised as dual use, non-ITAR cameras. Similar IRFPAs are available from companies in Taiwan (Attachment 3) and many other countries. The existence of these IRFPAs shows that many IRFPAs are true dual-use technologies of the sort the Commerce Control List was created to hold. The USML is best suited for true military-only technology.

For civil automotive applications, industry is producing solid state collision avoidance and navigation LIDAR which, under the proposed Note to paragraph (b)(6), will not be subject to the ITAR provided their range is limited to 200 meters. This range should be extended to 250 meters, because this is the range of competitive automotive radar (Attachment 4). Additionally, these components for civil automotive LIDAR use FPAs that operate in 900 – 1700 nm range that are captured by the proposed (c)(2) even when the FPA is poorly adapted for military night vision applications. IRFPAs used in civil automotive LIDAR applications are components of commercial machine vision devices, not night vision devices. Note eye-safety is an FDA requirement for civil laser systems (limited exemptions are available for military products), and that FDA requirement is the basis for use of IRFPAs in automotive applications. An IRFPA in the 900-1,700 nm spectral range is used to detect the reflected light from civil LIDAR lasers (the laser is similar to a flash bulb in an ordinary camera) because the laser intensity needed to achieve collision avoidance distances is eye-safe in this spectral range but not eye-safe at shorter wavelengths not captured by (c)(2).

Similarly, a multi-pixel FPA is needed to distinguish, for example, pedestrians from moving vehicles. This is not efficiently done with one pixel or even a few pixels when scanned over the camera field of view due to image distortion. ITAR controls on components utilized in these civil automotive systems will hinder other governmental priorities, such as automotive safety. Over 30,000 Americans die on US highways each year and more than 1,000,000 die on highways worldwide. Many of these casualties will be avoided in the future by the increasingly widespread adoption of civil automotive crash avoidance and navigation systems based upon IRFPAs. Because of the worldwide need, the automotive application is also a large and lucrative emerging market for American business.

As mentioned above, a principal goal of ECR is a well-defined bright line between military and non-military technologies. Unfortunately, as proposed (c)(2) captures almost all IRFPAs with the stated spectral range without regard to whether they are sensitive enough to actually be used to detect the low signals required of night vision detectors. As should also be clear from above discussion the technology to make InGaAs devices is in widespread use in civil commercial applications, is definitely not unique to the USA, and should not be considered a crown jewel technology. Placing ITAR controls on InGaAs IRFPAs as a class, without greater technical specification to separate military systems from those in ordinary commercial use, will do nothing to prevent anyone outside the United States from acquiring the technology. It will, however, further savage the U.S. industrial base.

If on additional review it proves impractical to adequately define the bright line between civil and military products, alternative options utilized elsewhere in ECR, that could be adapted for use with IRFPAs include a revision to exclude IRFPAs used in civilian LIDAR, including civil automotive LIDAR. In the alternative, conforming controls on IRFPA to similar usage in the Wassenaar Agreement Munitions List, and in other ITAR categories revised under Export Control Reform, it could control only those IRFPAs "specially designed" for military applications. If the government determines that these carve outs are too broad, that only serves to highlight the importance of more carefully defining the performance criteria that defines the bright line between civil and military IRFPAs.

<u>Proposal for Revised Language</u>.

Amend the Note to paragraph (6)(6) by striking "200" and replacing it with "250".

Amend the Note 1 to paragraph (c)(2) to include the clause: "IRFPAs used in automotive or civilian LIDAR are not subject to the ITAR."

Add a Note to paragraph (e)(3) stating "Paragraph (e)(3) does not control wafers incorporating structures for a ROIC specially designed for civil automotive LIDAR."

Amend the Note to paragraph (e)(4) adding a statement that "ROICs specially designed for civil automotive LIDAR are not controlled by paragraph (e)(4)."

Add a Note to Paragraph (e)(5) stating "Paragraph (e)(5) does not control ROICs specially designed for civil automotive LIDAR."

<u>Alternative Language for Paragraph (c)(2).</u>

Amend paragraph (c)(2) to read: "Photodetector, microbolometer detector, or multispectral detector IRFPAs specially designed for military applications and having a peak response within the wavelength range exceeding 900nm but not exceeding 30,000 nm…"

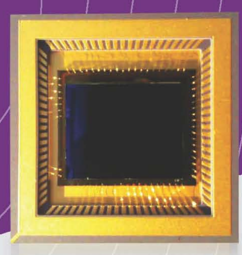
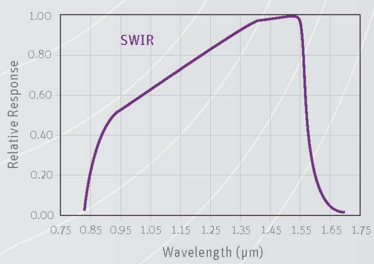
XFPA-1.7-640-LN2

LN2 cooled high resolution SWIR detector



Designed to have the lowest noise and highest sensitivity for low-light-level measurements



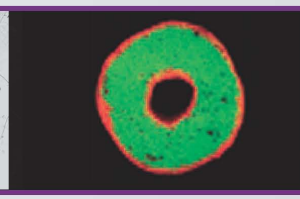
The XFPA-1.7-640-LN2 excels in performance for any R&D spectroscopy or semiconductor failure analysis task. These demanding applications, where very low light levels need to be measured, require image sensors with low dark current, low noise and best responsitivity in the SWIR range. All of these features are now combined in one single device.

The in-house developed InGaAs detector XFPA-1.7-640-LN2 is optimized for 77K operation, using Liquid Nitrogen (LN2) cooling and is based on a SFD (Source Follower per Detector) read-out topology for ultra-low noise levels ever seen (<20 e-). Additionally, a very low dark current of less than 5e-/pixel allows for integration times of several hours.

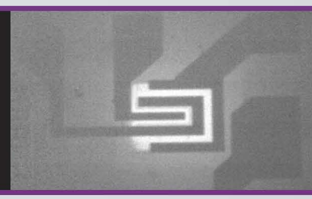
The high resolution 640 x 512 InGaAs detector with 20 μm pixel pitch features a maximum full frame rate of 2.5 Hz. The frame rate can be increased when a smaller region-of-interest is selected. A non-destructive read-out mode simplifies operation when long integration times are used.

Designed for use in

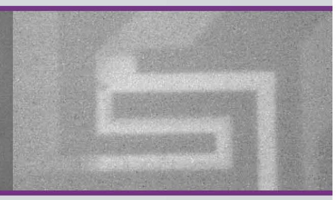
Astronomy



Lab spectroscopy



Photon emission 10x zoom



Photon emission 20x zoom

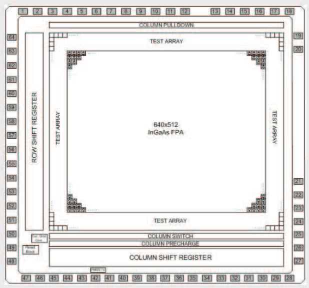
Applications

- Astronomy
- Raman spectroscopy
- Low light level SWIR & VisNIR imaging
- High resolution imaging spectroscopy
- Failure analysis via photon emission or electro-luminescence

Benefits & Features

- Lowest noise
- High sensitivity
- Low dark current
- Extreme long integration time
- Measuring extreme low light signals
- Extending SWIR imaging to the visible

Sensor architecture



Specifications

Array Specifications	XFPA-1.7-640-LN2
Array characteristics @ 77K	
Array type	InGaAs
Spectral band	Standard 0.85 to 1.6 µm; optional: 0.4 to 1.6 µm
# pixels	640 x 512
Pixel pitch	20 µm x 20 µm
FPA cooling	LN2
Full frame rate	2.5 Hz (4 output mode)
# outputs	1 or 4 selectable
Integration time	up to 24 hours
Pixel operability	> 98 %
Detector characteristics @ 77 K	
Peak sensitivity wavelength	1.5 µm
Peak Quantum Efficiency	> 80 %
Windowing	Yes
ITR and IWR	Yes
Operating temperature range	77 - 300 K
Pixel clock frequency	20 kHz or 250 kHz
Power consumption	2 Watt
Supply voltage	3.3 V
Gain (e-/ADU count)	2.2 µV/e-
Pixel Well Depth	400 000 e-
Noise	< 20 e-
Dark current	< 5 e-/sec per pixel
Dynamic range	100 dB

Xenics
Infrared Solutions

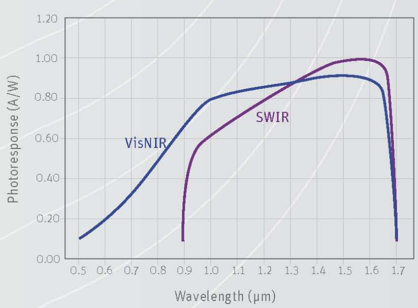
Imagine the invisible

Modules & components

XSW-640

High resolution
TE1-stabilized SWIR OEM module

Ready-to-integrate SWIR OEM module consuming ultra-low-power



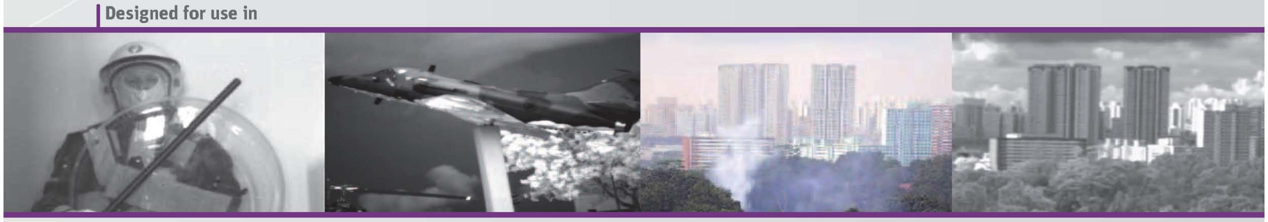
Xenics' XSW-640 OEM module is extremely compact and versatile for easy and swift integration in your SWIR imaging configuration.

Typical OEM applications include infrared imaging for man–portable and unmanned (airborne and land-based) vehicle payloads, night vision, border security, Search & Rescue (SAR) and more.

The XSW-640 OEM module detects short wave infrared radiation between 0.9 (optionally 0.4) and 1.7 µm with a wide dynamic range and wide operating temperature.

The Thermo Electric (TE) stabilization reduces the dark current and noise levels. Together with on-board image processing you will have best contrast and high image quality.

Designed for use in



Person identification — Camouflage detection — Vision enhancement: looking through haze with SWIR

Key features

- Made in Europe
- High resolution
- Easy connectivity
- Small 20 µm pixel pitch

OEM applications

- SWIR sights
- UAV / UGV
- Border security
- Laser detection
- Night vision (passive & active)
- Search & Rescue
- Driver assistance
- Electro optical payloads
- Long range identification
- Enhanced Vision Systems (EVS)

Ready-to-integrate

InGaAs FPA 320x256

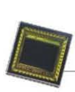
The InGaAs focal plane array is the optimized solution for near-infrared imaging and imaging spectrography applications in 900nm to 1700nm wavelength range especially under uncooled condition. The core technology of CLPT implements the InGaAs FPA with excellent quality. The CLCC package also facilitates the mechanical design of CCD and CMOS camera vendors.

Features

- 320x256 array format
- 30um pixel pitch
- CLCC package
- Low dark current
- High quantum efficiency
- High operability

Applications

- Near-infrared imaging
- Hyper spectrum
- Covert surveillance
- Semiconductor inspection
- Astronomy and scientific
- Industrial thermal imaging



中華電信股份有限公司 Chunghwa Telecom Co., Ltd.

Technical features	
Frequency range	76...77 GHz
Distance	0.5...250 m
Accuracy	±0.1 m
Relative speed	-75 ...+60 m/s
Accuracy	±0.12 m/s
Vision range	
Horizontal opening angle	30° (-6 dB)
Vertical opening angle	5° (-6 dB)
Modulation	FMCW
Max. number of detected objects	32
Operating temperature	-40 °C...+85 °C (periphery)
Vehicle connector	MQS 8 Pins
Cycle time (incl. auto diagnosis)	typically 80 ms
Dimensions (H x W x D)	77 mm x 74 mm x 58 mm
Weight	285 g
Power consumption	typically 4 W
ISO certification	ISO 15622 Class IV sensor

Sensor architecture

The LRR3 sensor is a monostatic Frequency Modulated Continuous Wave (FMCW) radar with four fixed beams. An important aspect of the sensor architecture is the high level of integration for the RF-functionality as well as for the sensor control unit and the signal processing. This results in a highly reliable and compact sensor. We use cost-effective, fully silicon based technology for the RF-components. Innovative signal processing algorithms allow excellent measurement performance and the handling of complex traffic situations such as a "lane free detection" by angular separation of objects. Our dedicated safety concept guarantees the compatibility of the sensor with safety relevant applications.

The sensor consists of two PCBs:

- The RF-module contains the RF-circuitry (SiGe-MMICs) and the Radar-ASIC with integrated modulation control and the signal pre-processing (pre-amplification, A/D conversion, filtering).
- The sensor control unit contains the microcontroller, the System-ASIC and optionally a FlexRay transceiver. The integrated sequencer takes over control tasks of the radar sensor. This enables the handling of new signal processing algorithms by the microcontroller as certain time consuming task schemes are outsourced and taken over by the Radar-ASIC. The microcontroller has been developed especially for driver assistance systems. The System-ASIC forms an essential part of the safety concept. It provides the power supply and contains the CAN interfaces.

Sensor performance

The LRR3 sensor exhibits a combined patch lens antenna which is well suited for large frequency ramps allowing a high resolution in distance. Its advanced antenna design enables a detection range of 0.5 up to 250 m with a field of view of 30°. The field of view can be customized to an opening angle up to 45° by modifying the aperture of the lens. LRR3 provides excellent measurement accuracy of angle, velocity and distance as well as object separation.

Applications

The LRR3 is the centerpiece of the automatic distance and speed control system ACC (Adaptive Cruise Control) and Predictive Emergency Braking Systems. ACC and the Predictive Emergency Braking Systems network the radar sensor with the ESP® system.

ACC uses information from the long-range radar sensor to control the vehicle's speed by automatically braking and accelerating so that it maintains at a predefined minimum distance from the preceding vehicle.

Our Predictive Emergency Braking Systems continuously monitor the situation in front of the vehicle and trigger appropriate collision avoidance/mitigation measures in critical situations. They support the driver with an intelligent predictive warning concept and also provide effective emergency braking assistance in critical situations. If a collision is unavoidable, the system automatically triggers emergency braking in order to reduce the risk of injury.

Via intelligent networking of our radar sensor with components and systems installed in the vehicle or by integrating information of other sensors such as a camera or additional radar sensors we enable new applications or enhancements of existing functions. Through the use of multiple sensors and components we further increase the safety of vehicle occupants and other road users without increasing cost. Bosch collects this networking of components and systems under the name CAPS – Combined Active Passive Safety.

General Comment

General Comment: Category XII

The Export Control Reform (ECR) initiative was launched with an express purpose of drawing a clear demarcation, a reline,
between truly military technology and commercial technology with military capabilities. As described by Secretary Gates, this
was principally important for national security, but it has important implications for industry as well. The value of this reline to
the American economy is the support of our commercial technology base by allowing American technology to compete with
foreign products globally without the risk, expense and taint of ITAR controls. The rewrite of Category XII fails its goals by a
wide margin and should be fundamentally rewritten. The revised Category XII both fails to focus on truly military technology
and also captures items in widespread commercial use available from numerous countries which operate outside of the
multilateral regimes. Such overbroad controls will do little to restrict access by our adversaries, but will do much to lock U.S.
suppliers out of the international marketplace.

A reline should be driven by a parameter set whose values separate military performance from commercial performance. In
addition those items which are widely available internationally and currently sold commercially should, in the main, be on the
commercial side of the redline. Unfortunately it does not appear that an effective effort was made

by the government in
drawing technically reasonable relines or in simply researching the internet for commercial products available internationally.
A particularly egregious example is apparently infrared focal plane arrays (IRFPAs). IRFPAs used in a variety of commercial
and military imaging systems, are controlled by only one parameter, the wavelength of light (the color of light) in Category
XII (c)(2). This is not well reasoned.

Consider the result if a company took this approach in responding to a request for proposals from any military force anywhere
in the world. If a commercial company were to respond to a solicitation for a military imaging system by arguing that just
because their proposed system responds in some arbitrary way to the proper wavelength of light that it would be suitable for
contract award, the proposal would be thrown in the trash amid peals of laughter. Clearly there are many more performance
parameters that define an actual military system. Correspondingly it seems (c)(2) and many other proposed Category XII
rules should be considered embarrassingly shallow by serious technologists. In this case, however, the Category XII rewrite
has dire economic consequences, capturing commercial technology components under the ITAR and should be rewritten.

Apart from the effect of public comments, the citizens of the USA are dependent on the government to develop sensible rules
that both protect us and our economic future. In the case of the Category XII rewrite it clearly takes technical expertise and
an understanding of military systems to develop adequate and sensible rules. However, it takes less skill to research available
technology on the internet and determine what technology is available commercially and also determine what performance is
expected from this technology in years to follow. There is very little evidence that the government has made this effort to test
even its overly simplistic redlines. This is unconscionable for two reasons: (1) Getting the best rule possible should be a
government goal, given the serious economic impact of getting it wrong; (2) Letting many citizens duplicate the research
necessary to respond to the rewrite controls is a waste of our time and resources when one competent government
researcher could have saved us the effort.

Suggested Revision 1: Completely revise the Category XII rewrite using input from the industrial community to help the
government develop the proper performance parameters and their magnitudes.

Suggested Revision 2: Use, Specially designed for military applications in the Category XII controls where the performance
parameter set is complex or militarily sensitive.

General Comment

Discussion: Proposed Category XII (c)(2) and (c)(4)-(c)(6)

(c)(4)-(c)(6) proposes to decontrol some of the IRFPAs controlled in (c)(2) if they are in a permanently encapsulated sensor
assembly: in (c)(4), if the IRFPA is less than 256 detector elements (16 x 16 for example); in (c)(5) if IRFPA is a
micobolometer of less than 328,000 detector elements (roughly 573 x 573); in (c)(6) multispectral IRFPAs having a spectral
response below 1500 nm. Apparently the logic behind these decontrols is that a permanently encapsulated sensor assembly
somehow mitigates the illogic of using a single performance parameter, wavelength, to control a system that has at least eight
relevant performance parameters, IRFPAs in (c)(2). These decontrols do not enhance the U.S.As competiveness in overseas
markets and in fact may diminish the security of crown-jewel technologies. It is recommended that these decontrols be
deleted and (c)(2) be modified instead.

Cost, risk and the possibility of investment, with resulting business expansion, are critical business issues. ITAR control of
technology creates very significant legal risks for manufacturers, customers and investors. Due to these legal risks there are
very few commercial investors willing to take a chance on a product containing ITAR components. There are also cost
consequences for manufacturing products including ITAR components. For example, permanently

encapsulated IRFPAs use ITAR controlled readout integrated circuits (ROICs) and ITAR controlled detector arrays. At TSMC, a well-known CMOS foundry, a ROIC wafer produced using an ITAR controlled wafer process costs twice as much as an identical wafer produced using non-ITAR processing. Hence apart from the cost of implementing ITAR procedures and licensing in the manufacture of the sensor assembly, the ROIC is twice the price paid by offshore competitors.

Based on the carve-out language in encapsulated IRFPAs, (c)(4)-(c)(6), crown jewel technologies could be part of a permanently encapsulated sensor assembly . Apparently the encapsulation rationale is that packaging will protect the device from all back-engineering. This is almost certainly not true for all the IRFPAs covered by these rules. A concerted back-engineering effort may only require a piece of the IRFPA and a piece of the associated ROIC to acquire enough information, over time, for experts to reproduce it. A significant back-engineering effort is required but there are countries with the funds, expertise and motivation to try to obtain these most-advanced, American, military technologies. The only way to adequately protect our crown-jewel technologies is to limit access to them and that is ITAR control. Encapsulation carve-outs compromise that technology. It would be far more efficient to distinguish the EAR technology from the ITAR technology as is done in the amendment language proposed below. It is a waste of USG effort and an unnecessary burden on American businesses to control non-ITAR IRFPAs on the EAR, using the semi-ITAR new 600 ECCN series, and inadequately protect crown-jewel military IRFPAs.

Proposed Amendments:

1. Amend paragraph (c)(2) to read: Photodetector, microbolometer detector, or multispectral detector IRFPAs specially designed for military applications and having a peak response within the wavelength range exceeding 900nm but not exceeding 30,000 nm

2. Delete (c)(4)-(c)(6)

*(b) Lasers, and laser systems and equipment, as follows:

Proposed Rule (b)(9):
Lasers operating at a wavelength exceeding 3,000 nm that provide a modulated output for systems or equipment controlled in Category XI(a)(4);
Comment: This proposed rule may inadvertently cover standard commercial lasers such as the ARIES fixed-wavelength mid-IR laser (http://www.daylightsolutions.com/assets/004/5409.pdf), which has an operating wavelength exceeding 3,000nm and modulation DC-1 MHz. Please clarify. The ARIES laser is available for sale in China from distributor A&P: http://www.anpico.com/en/ProductDetails_43.html.

Proposed Rule (b)(10):
Tunable semiconductor lasers having an output wavelength exceeding 1,400 nm and an output power greater than 1 W;
Question: This proposed rule does not (presumably) cover fixed wavelength broadband sources (50 nm for example), only tunable sources at these wavelengths?

Proposed Rule (b)(11):
Non-tunable single transverse mode semiconductor lasers having an output wavelength exceeding 1,510 nm and either an average output power or continuous wave (CW) output power greater than 2 W;
Question: Does this proposed rule refer to the power from each (single mode) emitter being rated at 2 W, or does it also cover the combining of multiple single mode emitters into one beam?

Proposed Rule (b)(12):
Non-tunable multiple transverse mode semiconductor lasers having an output wavelength exceeding 1,900 nm and either an average output power or CW output power greater than 2 W;
Question: Does this proposed rule refer to the power from an individual multi-mode emitter at this wavelength or does it also cover the combining of many emitters into one beam?

Proposed Rule (b)(14):
Developmental lasers and laser systems or equipment funded by the Department of Defense;
Question: The purpose of the SBIR program is to foster small business commercialization of SBIR-funded technology, so restricting the export of products that result from SBIR funding appears to conflict with this purpose. See https://www.sbir.gov/about/about-sbir. Will this proposed rule apply to SBIR programs that are funded by the Department of Defense?

Category XII Comments
Comment on Proposed Category XII (e)(3).
Certain wafers

Comments for Paragraph (e)(3) It reads, Paragraph (e)(3) is added for certain wafers incorporating structures for Read-Out Integrated Circuits controlled in (e)(4) or (e)(5) or for IRFPA detectors controlled in (c)(2). This is too general of a statement. For instance, we use wafers of similar structure for single element devices that are not ITAR restricted. These wafers can be processed to build IRFPAs as well as single element devices. Companies from all over the world have patented or published wafer structures that would be suitable to build IRFPAs. Every fiber to the home network utilizes devices built from wafers that could be used to build IRFPAs. Having control at this level, without using a more descriptive term than certain is terribly short sighted and fails miserably to draw a clear bright line.

Suggestion:
1. Remove entire paragraph and replace with a section that would exempt from the ITAR all single element, 1d, and 2d detectors with less than 100 elements, no pixel size restriction. This would be a clear bright line and allow optical communication companies some room for technical advancement.
2. Add specifically designed for military use to the statement. i.e. Paragraph (e)(3) is added for wafers specifically designed for military use incoporating structures for Read-Out Integrated Circuits controlled in (e)(4) or (e)(5) or for IRFPA detectors controlled in (c)(2)

Comment on Proposed Category XII (f).
Technical data

This section is trying control technical data and my comment is related to wafers. The best quality wafer material is now sourced overseas. We need to supply a structure (technical data) to the manufacturer to grow this wafer. If this rule is not more specific we would not be able to procure wafers in some instances.

Suggestion:
Amend the Note 1 to paragraph (f) to remove, wafers incorporating IRFPA or ROIC structures controlled in paragraph (e)(3) of this category, and specially designed readout integrated circuits (ROICs) controlled in paragraphs (e)(4) and (5) of this category, remain subject to ITAR even if the technical data or defense services could also apply to items subject to the EAR.

Comment on Proposed Category XII(c)(2).
(c)(2) captures almost all IRFPAs with the stated spectral range. As I mentioned above, the technology to make InGaAs devices is in the public domain via scientific publications and patents. Placing ITAR controls on all InGaAs IRFPAs will destroy the burgeoning collision avoidance market in the US and will do nothing to prevent anyone outside the United States from acquiring the technology.

Suggestion:
1. paragraph (c)(2) is added for certain photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) specifically designed for military use.

Conclusions
1. This proposal is headed in the wrong direction and should fundamentally be rewritten
2. Specifically designed should be more fully applied to this category.
3. USML should align with the Wassenar Munitions list

General Comment

Following the Amendment to the International Traffic
in Arms Regulations: Revision of U.S.
Munitions List Category XII

(6) For any criteria the public believes control items in normal commercial use, the public is asked to identify the multilateral controls (such as the Wassenaar Arrangement's Dual Use List), if any, for such items, and the consequences of such items being controlled on the USML.

Taking in exemple the goods that are in section 6 - Sensors and Lasers of the USML, some electro-optics cameras that are already controlled in Wassenaar Arrangement's Dual Use List could be controlled in the USML, will give a disadvantage to foreign companies, who uses U.S. non-ITAR controlled products. The Wassenaar Arrangement's Dual Use List is already being respected and inforced by Canada and the others countries that agreed to it.

In section 6 of the USML, there are a lot of products that are dual-use and are controlled only for a component that could be integrated to a medical camera or a surveillance camera, no matter who the final end-user of the goods could be. Thus, adding another sort of export control like the USML, will negatively impact SMEs in Canada that are selling internationally and abiding to Canada's export control laws. Perhaps there are some goods that are not widely use as commercially as others, but the distinction should be made between a precise type of goods and not only for a complete category in section 6.

Adding paperwork for a USML export license, will mean more hours, more learning programs for a SME that is already juggling with less human power than a big corporation, in a more competitive world. The Wassenaar Arrangement's Dual Use List is sufficient for a export control measure, when using non-ITAR controlled products.

Office of Defense Trade Controls Policy
U.S. Department of State
Via Email: DDTCPublicComments@state.gov

Subject: ITAR Amendment – Category XII

To Whom It May Concern:

Armasight, Inc. is a U.S. Manufacturer, Supplier and Exporter of Night Vision and Thermal Imaging devices including monoculars, binoculars, goggles, clip-on, and weapons sighting systems that are designed for both military and civilian applications. The majority of our night vision devices utilize image intensifier tubes (IITs), while our thermal imaging devices utilize IRFPA based thermal imaging cores. All are sourced from vendors, because Armasight does not manufacture core technology IITs or IRFPAs.

Armasight has reviewed the proposed changes to Category XII and the EAR, and while we see some additional clarity regarding the "bright line" between ITAR and non-ITAR controlled commodities, there remains a lack of clarity in many areas. We address below portions of the proposed rules, providing our assessment and suggestions for your review and consideration.

- **The Definition of a Weapon Sight, versus an Imaging Device Should Be Clarified**
  - We feel that it would be helpful to clearly define what constitutes a "weapon sight," as this term remains undefined, but triggers controls. Over the last few years, Armasight has received conflicting rulings and opinions from DDTC and BIS as what defines a "weapon sight." Some rulings and opinions have indicated that, to be a "weapon sight", the article must have aiming capability (e.g., reticles), while others have indicated that the ability to place the sight on a weapon, regardless of aiming capability, is sufficient to make an item a "weapon sight". The conflicting views on this definition have led to our receiving unique and unusual rulings, such as a CJ that resulted in EAR jurisdiction, but indicated that the item is to be treated as a 6A992 imaging device if shipped alone, but as a 0A987 "weapon sight" if shipped together with an EAR99 universal weapon mount accessory. The particular item in question also lacks the ruggedness to survive weapon shock, but the mere theoretical ability to attach the imager to a weapon was cited as the basis for such a ruling. This ruling is inconsistent with the plain reading of the regulations and presents unique challenges in classifications of future products and maintenance of appropriate controls. Providing a clear definition in part 772.1 or in an explanatory note, outlining the

Armasight Inc.

info@armasight.com

specifications that would classify an article as a weapon sight, such as, “Unit must possess a fixed weapon mount, have an aiming reticle and user adjustable bore sighting capability, and be able to withstand weapons shock [at an appropriate performance parameter]” would eliminate some confusion within the industry and establish more consistent classifications for existent and future products.

- **GEN II Image Intensifier Tubes Should Not Be ITAR-Controlled**
  - Armasight sources all of its Generation II image intensification tubes from outside the United States, because there are no U.S. manufacturers of Gen II IITs. Foreign manufacturers include Photek, UK; DEP, Netherlands; Photonis, France; Harder Digital SOVA, Serbia; Bharat Electronics Ltd., India, along with 3-4 manufacturers in Russia and 2 in PRC. With no manufacturer of these commodities in the United States, the ITAR would be controlling foreign commodities brought into the United States that are distributed worldwide from the foreign manufacturers with little to no restrictions. Indeed, such controls serve more as an encouragement for U.S. companies to establish subsidiaries outside the United States to assemble and market such items, than they serve to protect the U.S. warfighter or preserve U.S. technological advantage.

  - We question Image Intensifier Tubes with luminous sensitivity exceeding 500 uA/lm being placed on the ITAR, as the photosensitivity of GEN II Image Intensifier Tubes at their highest level remains 3-4 times lower than the photosensitivity of the average GEN III Image Intensifier Tube. It is our opinion that GEN II IITs exceeding the 500 uA/lm threshold would be more appropriately placed in a 600 Series ECCN, or in 6A002, rather than on the ITAR, therefore placing the “bright line” at GEN III+ on the ITAR and GEN II and below as non-ITAR. We also think that 350 uA/lm is an outdated control on Gen II IITs, and the Wassenaar level should be raised to 500 uA/lm.

  - Additionally, we question the need for worldwide license requirements and elimination of license exception eligibility for GEN II IITs controlled by 6A002 (i.e., those with a luminous sensitivity exceeding 350uA/lm). Such controls would prevent Armasight from importing 6A002-equivalent IITs from suppliers in countries such as Ukraine, China or Serbia, into the United States for testing and quality control, then re-exporting them under STA to an assembler in an STA-eligible country. This reduces our flexibility in terms of where we can assemble our products where GEN II IITs can be exported from the foreign manufacturers in Serbia, China, Russia, etc. with little to no restriction.

- **IRFPA Based Weapon Imaging Systems Subject to the ITAR**

Armasight Inc.
815 Dubuque Avenue,
South San Francisco,
CA 94080, USA
Phone: (888)959-2259
Fax: (888)959-2260
Intl Phone/Fax: (650)492-7755
www.armasight.com
info@armasight.com

- Armasight generally designs its IRFPA based Imaging Systems around third-party supplied IRFPA "Cores". The proposed ITAR control starts out by applying a bright line threshold of control over any Weapon Imaging Systems that incorporate an IRFPA with a peak response exceeding 1000 nm, which in turn could mean that Weapon Imaging Systems incorporating an EAR-controlled IRFPA would be controlled under the ITAR. We feel that this could lead to over control of, for example, weapons imaging systems incorporating 6A002 or 6A993 microbolometer IRFPAs that happen to have a peak response rate over 1000nm, but a frame rate at <9Hz. It does not make intuitive sense that the cores are subject to the EAR, but the end-item would be considered a defense article.

- The next control parameter includes the incorporation of any "article subject to this subchapter". This creates some interpretive difficulties, because the controls on bare IRFPAs, packaged IRFPAs, and cores incorporating packaged IRFPAs are not consistent. We assume that, if Armasight purchases a core from a vendor, we would only need to review the performance parameters of items controlled under XII(c)(12), and not "see through" to the controls applicable to IRFPAs called out in XI(c)(2) through (8). An explanatory note confirming that the "see-through" principle does not apply in these circumstances would be helpful. For example, there could be a note to XII(a)(2)(ii) that says "If the incorporated article is an IRFPA core, only the control parameters of XII(c)(12) are relevant to determination of ITAR control." Otherwise, it is possible that there could be confusion about whether incorporation into a Weapon Imaging Device of cores that are EAR controlled, but contain IRFPAs that would be controlled under the ITAR if not already incorporated into a core, would trigger ITAR control.

- There is further potential confusion and difficulty of drawing bright lines at the level of the Weapon Imaging System, because the controls on IRFPA cores set forth in XII(c)(12) include some items with FPAs that have a peak response below the 1000 nm threshold laid out in XII(a)(2)(i). For example. XII(c)(12)(i) includes certain shock-resistant cores with microbolometer IRFPAs exceeding 111,000 detector elements, but there is no specification of a peak response wavelength. XII(c)(12)(ii) covers a subset of microbolometer IRFPAs controlled under XII(c)(2) and (c)(5), which covers items that have a peak response rate between 900 nm and 30,000 nm, as well as having over 328,000 detector elements. Thus, there is a confusing interplay between the controls in XII(c)(i) and XII(c)(ii). On balance, while there is a hodgepodge of control parameters to consider, Armasight thinks it makes more sense to apply ITAR controls to IRFPA-Based Weapons Imaging Systems_only if they incorporate an ITAR-controlled IRFPA, or more realistically, an ITAR-controlled core as listed in (c)(12), and not to superimpose a control that would apply ITAR control to all

Armasight Inc.
815 Dubuque Avenue,
South San Francisco,
CA 94080, USA
Phone: (888)959-2259
Fax: (888)959-2260
Intl Phone/Fax: (650)492-7755
www.armasight.com
info@armasight.com

Weapons Imaging Systems that incorporate an IRFPA with a peak response exceeding 1,000 nm, as that could impose ITAR control on Systems that incorporate EAR-controlled IRFPAs. If such EAR-controlled IRFPAs are not deemed sensitive enough to be subject to ITAR controls when exported by themselves, it doesn't make sense for Weapons Imaging Systems that incorporate them to be up-classified to the ITAR. We note that this would be consistent with the approach taken in Category XII(c)(13) for monoculars, binoculars, etc., although some of the interpretive difficulties mentioned above apply to the monoculars, etc., which generally incorporate vendor-supplied "cores", instead of integrating an IRFPA and custom read-out electronics.

- We do agree that applying ITAR controls to certain Weapon Imaging Systems that incorporate a ballistic computer for adjusting the aim point display is appropriate, but the way the control is written in Cat XII(a)(1)(iii) makes it unclear whether the control applies only to night vision capable Weapons Imaging Systems, or if it applies to daylight sights, which would fall under Category I. If the intent is to control only night vision devices in XII(a)(1)(iii), then an appropriate performance parameter or Note should be introduced, to avoid confusion about potential overlap with Category I items (either currently or after that Category goes through ECR).

- **EAR Controls on Weapon Imaging Systems Are Too Broad and Cover Items in Normal Commercial Use, the Order of Review Is Not Consistent with the Rest of the EAR, and Inconsistencies Between 0A987 and 600 Series Controls Lead to Unexpected Outcomes**
  - The EAR contains three potential ECCNs that could apply to non-ITAR night vision Weapon Imaging Systems: 0A987, 6A615.d, and 6A992. Based on the text of 6A615.d, which excludes items subject to 0A987, it appears that the order of review of these categories is first 0A987, then 6A615.d, then 6A992. This seems to diverge from the normal order of review laid out by BIS with respect to the CCL, as it is normally 600 series first, then all other ECCNs. An explanatory note in the Order of Review guidance may be helpful in avoiding confusion, because if one follows the normal order of review, 6A615.d would appear to cover all "weapon sights" operating between 700 nm and 1000nm but then the exporter is told that 6A615.d does not include items subject to 0A987, which could cause confusion about which ECCN to consider first.

  - We note, as an aside, that the lack of revisions to Category I still introduce confusion and lack of clarity between what is a "military" day sight and a non-"military" day sight subject to 0A987, and that the cross reference in Category I directing exporters to Category XII for controls on "night vision" military

Armasight Inc.
815 Dubuque Avenue,
South San Francisco,
CA 94080, USA
Phone: (888)959-2259
Fax: (888)959-2260
Intl Phone/Fax: (650)492-7755
www.armasight.com
info@armasight.com

riflescopes would need to be more specific in terms of performance parameters (e.g., peak response wavelength or wavelength of operation) to be clear about which are Cat I and which are Cat XII. Adoption of a consistent terminology (e.g., "weapons sights") across the categories would also be helpful." While we understand that reforms to firearms categories are politically controversial, reform of the non-firearms portions of Category I regarding weapons sights seems necessary to resolve this confusion, and could be done as a partial reform of Category I.

- If a night vision Weapon Imaging System is not subject to 0A987, then the exporter is supposed to consider 6A615.d. However, 600 Series ECCNs are supposed to apply to items that are inherently military in nature, and 6A615.d imposes controls simply based on the wavelength of operation, which imposes 600 series controls on items, such as clip-on night vision systems, that are currently in normal commercial use, and many of which have been classified as 6A992 items by BIS in the past. Applying a 600 series ECCN to all clip-ons that operate in the range of 700-1000nm is an overly broad control. Only such items that are ruggedized, meeting higher military-grade standards for shock and containing higher-performing optical elements should be subject to 6A615.d, in keeping with the objectives of ECR not to impose controls on items in normal commercial use, unless they confer some differential military advantage or are produced predominantly in the United States.

- Another confusing aspect of these multiple ECCNs is that 6A615.d's description of controlled items includes, among other things, "Weapon Sights," but then excludes any items controlled by 0A987. 0A987 describes several types of "sights": "Telescopic sights," "Holographic sights," "Reflex or "red dot" sights," "Reticle sights," and "Other sighting devices that contain optical elements." This is a fairly broad description of the types of weapon sights, but it is not clear whether BIS and DDTC intend to cover all non-ITAR infrared weapon sights under 0A987, or if there may be some other types of sights that would be controlled by 6A615.d, but from Armasight's perspective, that seems like a null set of items. If so, it would be clearer to drop the description "weapon sights" from 6A615.d, and just make a cross reference in the Related Controls note to indicate that all non-ITAR "weapons sights" are controlled under 0A987. If, however, the US Government intends to control some infrared "weapon sights" under 6A615.d, then either 0A987 should be revised to be clearer about what types of infrared sights are to be controlled and which are not. It is very difficult for exporters to determine which types of "sights" are controlled under 0A987, due to the vague descriptions, which forces the submission of CCATS requests to determine what is the correct ECCN.

- If we are correct that 0A987 is intended to cover all non-ITAR infrared weapon sights, and other types of Weapon Imaging Systems operating in the

Armasight Inc.
815 Dubuque Avenue,

www.armasight.com
info@armasight.com

wavelengths between 700 nm and 1000 nm are intended to be controlled under 6A615, there are some odd outcomes in terms of certain license requirements, since 0A987 controls do not overlap entirely with RS1 controls applicable to 6A615.d items.

0A987 was included in the EAR as a result of Firearms Convention and Crime Control requirements, and is subject to Crime Control, Firearms Convention, and United National Controls. While not expressly excluded from STA eligibility in 740.20(b)(2), like other 0A98X items, 0A987 is not, on its face, eligible for use of License Exception STA because, pursuant to 740.20(c)(1), it is subject to reasons for control other than NS, CB, NP, RS, CC or SI. 0A987 is subject to FC and UN controls, which go beyond what is listed in 740.20(c)(1) as being eligible for License Exception STA to A:5 countries.

That doesn't make a difference in most cases, because most A:5 countries are NLR destinations for 0A987 items. However, A:5 countries Argentina, Austria, Canada, Sweden and Switzerland require a license, and are not STA eligible. However, A:6 country Albania is an NLR destinations, while A:6 countries Hong Kong, India, Israel, Malta, Singapore, South Africa Taiwan require a license and are not STA eligible, because only NS-only items are eligible for STA to A:6 countries.

It would seem that night vision sighting devices would be perceived to be more sensitive than non-sighting Weapon Imaging Systems, but placing them in 6A615.d would apply a license requirement on a worldwide basis, although such items would be STA eligible for A:5 countries. Thus, 0A987 sighting devices can be shipped NLR to most A:5 countries and are eligible for APR, but less sensitive 6A615.d non-sighting devices would require additional STA assurances to go to the same countries and would not be eligible for APR. While not a major issue, it is also an odd outcome that 0A987 sighting devices would be able to go NLR to Albania, an A:6 country, but less sensitive non-sighting Weapons Imaging Devices, such as clip-ons, would require an individual license to Albania, because 600 series items are not eligible for STA to A:6 countries.

We recognize this complexity is due to the incomplete overlap between FC/CC/UN controls and NS/RS controls involving 600 series items, but these anomalies could be addressed by removing the license requirements for 6A615.d for 0A987 NLR countries, although STA eligibility should be retained for Argentina, Austria, Canada, Sweden and Switzerland for 6A615.d items, since non-sighting items are less sensitive and not subject to FC/CC/UN restrictions. We note that these additional controls would make more sense, and adjustments to the controls on 6A615.d would be less appropriate, if 6A615.d were to apply only to "military" grade night vision Weapon Imaging Systems, and not to civilian items, which would drop to 6A992 control.

- **Creation of 0E987 Imposes Controls on Technology that Was Not Previously Controlled, Targets Technology that Is Widely Available Worldwide, and May Not Actually Control Any Technology at All, Because There is Very Little Technology Related to the Development or Production of Night Vision 0A987 Items that Is Not Identical to that Used to Develop or Produce non-Night Vision Weapons Sights.**
  - Technology for the development and production of 0A987 items is currently EAR99 controlled. The creation of a control for information related to the "production" or "development" of 0A987 sighting devices that contain infrared imagers imposes controls on technology that is not currently controlled, and which, to the extent it actually exists, is widely available on a worldwide basis.

    However, it is not likely that 0E987 actually controls much technology at all, as defined in EAR Part 772.1 and the General Technology Note. The General Technology Note and the definition of "required" limit controls on technology to that which is "peculiarly responsible" for conferring the specific characteristics or performance parameters that qualify an item for the ECCN in question. 0E987 would control technology that is "peculiarly responsible" for making a sight night vision capable vs. a day sight. Under the current and proposed re-definition of "peculiarly responsible", any technology that is the same for the development of an 0A987 day sight and a night vision 0A987 sight would not be "peculiarly responsible", and thus would not be controlled under 0E987.

    The technology to develop or produce the night vision element would already be controlled by 6E001 or 6E002, or by other category 6 technology ECCNs, so the difference between production or development of an 0A987 night vision versus an 0A987 day sight, generally speaking, would be what type of imaging device is dropped into the body of the sight. Adjustments to accommodate an infrared imager would likely be solely for "fit" purposes, or perhaps involve the substitution of infrared capable optics, which would likely be of standard sizes so they could "drop in" to an existing day sight design. Thus the scope of controls would likely be limited to fit modification information to allow integration of a night vision element into the body of a sight.

    To the extent controlled, such information would be widely available on a worldwide basis, as the minor changes to a design to permit interface with either a night vision or day optical element are well-known and available on a worldwide basis, as night vision weapons sights are produced in numerous countries. Thus, it would not appear that the creation of this ECCN would serve much purpose, other than to create uncertainty regarding whether export licenses may be required to assist with the design of weapons sights that is currently treated as EAR99.

Intl Phone/Fax: (650)492-7755
www.armasight.com
info@armasight.com

- Controls on Bodies and Kits Should Be Clarified, as Government Classifications Have Been Inconsistent
    - Armasight also believes that these changes should address more clearly the controls applicable to semi-knock-down kits for weapon sights and other night vision devices. U.S. government rulings have treated such parts and components – many of which are foreign manufactured plastic components – are ITAR controlled, and in some cases have treated them as EAR99. Introduction of a "specially designed" concept is helpful, but such items should perhaps be more clearly called out in a 6A615.y category – although that could even be an over control, since many such items are manufactured as COTS equipment in China. Overall, more rational treatment of such non-critical components would be welcome.

- **Foreign Availability of Identical and Similar Products**
    - It is important to note that the technology used to manufacture night vision and thermal imaging systems is available worldwide and there are many countries currently producing systems that are of equivalent to the U.S.-manufactured goods. In the competitive international market, we are regularly informed of foreign manufacturers that have the ability to provide higher grade systems to the end user, but with far less restrictions and that can be delivered within a shorter timeframe. It is becoming increasingly difficult for U.S. companies to compete in the international market as the buyers are quickly discovering that they can purchase articles with the same performance, and have it much sooner and without having to go through the additional processes required for U.S license applications.

    - While many of the restrictions in place are needed and justified, there are other restrictions on U.S goods that, to the competitive market, seem too stringent and have begun to push U.S companies out of the market in favor of the foreign manufacturers. This is making us non-competitive in many ways. We feel that an overall assessment of international availability and reasonable adjustments would be justified. It has become clear that foreign-manufactured items are meeting or exceeding the specifications of U.S. made goods, and U.S. companies will quickly be eliminated from competition in the international markets if we cannot offer high grade devices at fair prices without a substantial amount of wait time, paperwork and "red tape". If the regulations become too tight and the process becomes too complicated, the affected customers will buy from manufacturers outside of the United States which will provide those Foreign suppliers with the capital to improve their products through investment in R&D, improve their manufacturing capability along with other industrial infrastructure advancements that have multiple secondary and tertiary effects in the

Armasight Inc.

info@armasight.com

competitive manufacturing world. In addition, when a foreign customer is not buying from the USA, then we lose ground/naval/air order of battle intelligence which helps the US Armed Forces develop both tactical and strategic engagement planning. It does not appear that the proposed changes take these factors into account, given that they expand ITAR controls and remove License Exception eligibility from the EAR, further constraining an already stressed U.S. industry.

- **Overall Assessment of the Proposed Rules**
    - While there are some improvements made in the proposed rules, we feel there is still much to address to ensure that the rules are clear, concise and fair across the board. The language of the rules is still a bit confusing and allows for varied interpretations. This issue is one that has plagued many of companies in our industry, as some receive more favorable classifications than others for identical products, depending on the interpretation of the officials handling the case. Simplifying the regulations and creating more clarity will eliminate the inconsistent interpretations of the regulations and lead to a more equal and fair competitive market. In reading the proposed regulations, it is clear that a novice reader would have extreme difficulty interpreting these regulations and properly classifying products without having to file for CJs or CCATS.

    - It would make much more sense to focus ITAR controls on the limited number of IITs, IRFPAs, and thermal imaging cores that are truly at the top of the performance threshold, and which have primarily military applications. For example, it would be much clearer to simply control Gen II IITs as dual-use items, given that the U.S. military has left such technology behind and there is no U.S. manufacturer of such goods, reserving ITAR control for Gen III+ items. ITAR control should also be reserved for only high-performance, large format Vanadium Oxide/Silicon Microbolometer IRFPAs, as well as high-performance, large format compound semiconductor IRFPAs, recognizing that the parameters may differ based on detector composition. The attempt to differentiate controls based on whether or not the IRFPA is packaged is extremely difficult to comply with, and it would make more sense to impose tight controls on the manufacturing technology for IRFPAs, instead of trying to impose different license requirements on items at different stages of manufacture. The packaging differentiator also doesn't make much sense in light of the trend toward wafer-level packaging.

ATTN: Regulatory Change, USML Category XII

Re: Response to Request for Comments Regarding the Revision of USML Category XII

On May 5, 2015, the Directorate of Defense Trade Controls (DDTC) issued a Federal Register notice requesting comments on proposed revisions to Category XII of the U.S. Munitions List (USML) via amendments to the International Traffic in Arms Regulations (ITAR).[1]

The Association for Unmanned Vehicle Systems International (AUVSI), the world's largest non-profit organization devoted exclusively to advancing the unmanned systems and robotics community, respectfully submits these comments on behalf of more than 7,500 members.[2]

AUVSI supports the effort to exclude light detection and ranging (LIDAR), laser detection and ranging (LADAR), and range-gated systems or equipment that are or will be used in civil automotive applications from control under the ITAR. These systems can provide key safety features for automobiles with autonomous and driver-assist functionality that will contribute to public safety. AUVSI's members are concerned, however, that the proposed language in USML Category XII(b)(6) and the accompanying note will create confusion for the industry, as described below. AUVSI also respectfully recommends that any exemption be expanded to include **civil vehicle applications**, not just civil automotive applications.

[1] Proposed Rule, Amendments to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII, 80 Fed. Reg. 25821(May 5, 2015).

[2] AUVSI is committed to fostering, developing, and promoting unmanned systems and robotic technologies. More information about AUVSI can be found on our website, at AUVSI.org.

1. The proposed language in the note to (b)(6) creates confusion

The note to (b)(6) is based on intended end use, not on objective criteria. The proposed language excludes equipment "for civil automotive applications" from ITAR control if it fits within the specified range limitation. This language potentially creates a different level of control for the same item, depending on its intended use. For example, a LIDAR system intended for sale to an automobile company for use in commercial vehicles would be released from control under (b)(6) (and may therefore be subject to the EAR). However, the exact same LIDAR system, if sold to a non-automotive company, would remain subject to the ITAR. Such a rule would create confusion for companies manufacturing, selling, and receiving those systems and related technical data. The lack of objective criteria also does not support the goal of Export Control Reform to "create a 'positive list' that describes controlled items using, to the extent possible, objective criteria rather than broad, open-ended, subjective, or design intent-based criteria."[3]

2. Potential over-control of LIDAR for use in other civil vehicles

The proposed control language in (b)(6) potentially captures LIDAR and related systems that are or are expected to be used by other civil vehicles, including certain commercial / civil unmanned aerial vehicles (UAVs). As in civil automotive applications, civil UAVs use LIDAR and related systems to avoid collisions. The use of these systems is expected to be critical in ensuring the safe use of civil UAVs as they are integrated into the national airspace. Thus, inclusion of such systems on the ITAR could seriously hinder the development and deployment of LIDAR and related systems in civil UAVs, to the potential detriment of public and air safety and the growing civil UAV industry.

AUVSI therefore respectfully requests that DDTC revise the note to (b)(6) to ensure that a broader category of "**civil vehicle applications**" are excluded from control under (b)(6). Such a revision would help to ensure that the reform of Category XII's does not retard the development of critical LIDAR and related safety systems for civil unmanned vehicles (and manned vehicles with autonomous and pilot-assist systems). AUVSI further requests that the current proposed 200 m range limitation in the note to (b)(6) be **expanded to 1,500 m** to accommodate LIDAR and related systems that are deployed for collision avoidance and other safety applications in civil UAVs. UAVs that are capable of moderate speeds need systems with range capabilities of at least that amount to provide sufficient time for the UAV's autonomous systems to sense and avoid objects in their flight path. Of course, some smaller UAVs with more limited speed capabilities can safely employee LIDAR and related systems with ranges of 200 m or less for collision avoidance purposes, however many systems should have access to the longer range specified above to promote safety.

Again, AUVSI prefers that the ITAR use a "positive list" format to control LIDAR and related systems, excluding from control systems that are or are expected to be used in civil vehicle applications – automotive and aerial. To the extent such a revision is not possible, AUVSI requests that the note to (b)(6) be expanded to exempt systems used in civil vehicle applications with a range of up to 1,500 m.

---

[3] Final Rule, Amendment to the International Traffic in Arms Regulations; Initial Implementation of Export Control Reform, 78 Fed. Reg. 22740 (Oct. 15, 2013).

RE: ITAR Amendment—Category XII

Dear Sirs/Madams,

I am writing on behalf of the Association of University Export Control Officers (AUECO), an association of over 115 senior export practitioners with export compliance responsibilities at more than 90 accredited institutions of higher education in the United States. As expressed in its founding charter, AUECO is committed to monitoring changes in the administration of export laws and regulations that could affect transactions and collaborations in academia.

AUECO is providing the following comments in response to the Department of State Proposed Rule for *Amendment to the International Traffic in Arms Regulations: Revision to U.S. Munitions List Category XII* (RIN 1400-AD32). AUECO is specifically interested in contributing to the export reform effort in order to ensure that the resulting regulations do not have an adverse impact on academic pursuits, and offer the following comments.

As export officers at universities conducting academic research, we are keenly aware of the value of some of the technologies described in the proposed Category XII as having dual uses in areas such as astronomy and space science, oceanography, telecommunication, photonics, computer processor-memory interconnects, materials engineering, thermal management, energy storage, energy conversion, photovoltaic devices, groundwater management, computational ophthalmology, and molecular medical diagnostic tools. There should be a clear delineation between items that have military and non-military end uses.

Request for note to be added to Category XII

We would recommend that Category XII include the following clarification note:
"Category XII does not apply to items that are specifically made for non-military end uses, such as astronomy, including stationary ground-based systems and telescope instruments, meteorology, other research or commercial end uses."

Comments on ITAR XII (b)(2)

There are commercial products (e.g., laser trackers) which meet this definition and cannot be converted to defense use. We recommend that the technical parameters be changed to exclude commercially available items.

Comments on ITAR XII (b)(3)(i)(ii)

There are commercially available products (e.g., FLIR, a commercial company) that would now be ITAR-controlled under this definition. We recommend that the technical parameters be changed to exclude commercially available items.

Comments on ITAR XII (b)(6)-(8)

XII(b)(6)-(8) – LiDAR systems can be used for meteorological purposes. It is possible that meteorological systems can be built to the specifications described in paragraphs (7)-(8).

Request for note to be added to Category XII (b) (6)-(8)
A note should be added that paragraphs (6)-(8) do not control LiDARs or other laser range-gated systems or equipment built for meteorological purposes or already commercially available.

Comments on ITAR (b)(11) and (b)(12)
Increasing the power from 1W to 2W is helpful.

Comments on ITAR (b)(13)
A power density of xxW/cm2 is stated, and power density depends on how the laser is focused using lenses external to the laser itself. This will be confusing because it is mostly an issue of how the user will use the laser, and we typically assume the laser is focusable.

Request for Wording Changes to ITAR XII (b)(13)

- We suggest the power density be changed to power (in terms of Watts) and also point to the focusability of the laser.
- Item (b)(13)(iv) should be deleted because companies such as IPG Photonics already sell commercial lasers at that wavelength with 100 times more power, in the several kW range.

Comments on ITAR XII (b)(14)
This sub paragraph is an overly broad statement of control that implies the funding source (Department of Defense) of lasers or laser systems will dictate whether or not the systems should be controlled as a munition. Per Note 1 to paragraph (b)(14), if a contract fails to include language that the system or equipment being developed is for both civil and military applications, then the system or equipment would therefore be ITAR-controlled.

Much initial work on lasers and laser systems is based on public domain information, conducted by universities, and may be sponsored under Department of Defense 6.1 (basic research) or 6.2 (applied research), which in most cases would be considered fundamental research under the ITAR.

Request for Wording Changes to ITAR XII (b)(14)
The proposed wording of this sub paragraph if not clarified will negatively impact research conducted at universities. Lasers not meeting the requirements for a military end use should not be controlled under ITAR, even if their development was funded by the Department of Defense.

Under the proposed definition of "development" (80FR 31525), it states "all stages prior to serial production, such as: design….", which could be thought to include any basic or applied research which is used in the design. This is clearly counter to the definition of fundamental research. The definition should include a statement that development does not include that work which would be considered fundamental research.

Comments on ITAR XII (c)
XII(c)(2)-(12) – Infrared focal plane arrays (IRFPA) may be used in astronomy in the development/production of land-based telescopes. These telescopes have a scientific purpose and do not have a military end use. Astrophysical investigations have expanded, along with technology, to encompass nearly all wavelengths. The infrared bands, which appear to be the subject of the new regulations, are especially important with their ability to see things otherwise blocked in the optical by gas and dust in the interstellar medium. These proposed regulations will affect infrared and sub-millimeter instrumentation.

Some techniques and hardware used in infrared instruments will be proposed for use at other wavelengths, including the X-ray band. The same bolometers used in the infrared have been adapted to be used in the X-ray band, for instance. State of the art infrared detectors for instruments that may be proposed/flown on scientific satellites and may be and are used in ground-based telescopes outside of the U.S. may be impacted by the proposed export regulations. MilliKelvin bolometers are also used in the X-ray wavelength bands, as they are used in the infrared. This would also affect them. Many of the best ground based astronomical sites are not in the United States, but in Chile, the Canary Islands, South Africa and other foreign destinations. Additionally there are multi-national teams participating in this research with these instruments and ITAR jurisdiction of this items could exclude participation of certain nationals.

Comments on ITAR XII Note 1 to paragraph (c):
The intent of this Note is unclear and should be clarified as to its applicability.

Comments on ITAR XII Note 2 to paragraph (c)(2): 12 (iii)
Some of these requirements are causing undo competitive advantage for foreign companies. For example, the proposed requirements will give Sofradir, a French company that produces bolometers and photon detectors, an advantage over U.S. Companies.

Request for Defined Terms ITAR XII(c)(2), (c)(4) and (c)(12)
We would recommend the following terms be defined:

- XII(c)(2) – "Integrated"
- XII(c)(4) – "Permanent encapsulated sensor assembly"
- XII(c)(12) – "Infrared imaging camera core"

Comments on ITAR XII (c)(7)
Current commercial applications of charged multiplication FPAs are now at 1,000 elements, but it is believed the commercial world will surpass 1,600 elements in the near future. Currently, there are leading foreign suppliers, such as Andor, with headquarters in the UK and locations in China, Japan and the U.S. of electron multiplying charge coupled devices for scientific, non-military-related research. Current applications for these cameras are for smaller devices but larger devices will soon be available from such foreign suppliers (e.g. greater than 1,600 elements in any dimension and having a maximum radiant sensitivity; exceeding 50mA/W for any wavelength exceeding 760 nm but not exceeding 900nm and avalanche detector elements).

Comments on ITAR XII(c)(9)
Even though the IRFPA (used in a land-based telescope) may have been developed for spaceflight or military use, we consider XII(c)(9) as overly broad when applied to commercial dewars, cooling systems and electronics that were not specifically designed to be used with controlled IRFPAs. Nor do we see a value in controlling the integrated dewar cooler assemblies which are custom-made for astronomical purposes. Under the proposed XII(c)(9), dewars, cooling systems, electronics and optics that were designed for commercial purposes would be controlled under the ITAR solely because of their use with a controlled IRFPA. Integrated IRFPA dewar cooler assemblies (IDCAs), with or without IRFPAs, can be put together easily by anyone who purchases a cooler from commercial suppliers such as Air Liquide, and a commercially available infrared detector array can be currently purchased from a U.S. company.

Examples of commercial cryocoolers using fully encapsulated detector array systems could include Pulse-tube cryocoolers, Gifford-McMahon cryocoolers, sorption refrigerators, adiabatic demagnetization refrigerators, and dilution refrigerators (not an exhaustive list), all of which are used for cooling astronomical focal planes and which are well-described in literature in the public domain. Examples of ECCN designations for commercial equivalent products captured by the revised ITAR XII include:

- Cryomech, Inc. - Gifford-McMahon Cryorefrigerators are EAR99 for part numbers: AL10, AL25, AL60, AL63, AL125, AL200, AL230, AL300, AL325, AL330, AL600.

- SHI Crygenics - Pulse Tube Cryocooler Series are EAR99 for part numbers: RP-062B 4K Pulse and RP-082B2 Pulse.

These commercially available devices could be purchased and used for other purposes without being subject to the ITAR, but once the products are associated with a controlled IRFPA, the devices would need to be controlled. This leads to a confusing and poorly manageable situation for a scientific or research organization.

Because these components would be subject to ITAR restrictions, details of their design or integration into the IRFPA system could not be discussed in scientific publications. However, because these are commercial products, it is very possible that details of their design and use are already in the public domain.

Request for Defined Terms ITAR XII(c)(9)
We request a better definition of what is included in an integrated IRFPA dewar cooler assembly. For example, are the following items to be included?

1. Optics within the dewar.
2. Cooling system components installed outside of the dewar, in some instances mounted at a distance from the dewar or part of a telescope facility and not directly part of the instrument.
3. Electronic control systems for the cooling system, which again may be mounted away from the dewar.
4. Systems used to control heating of the dewar (separate from the cooling system).
5. Optics mounted outside of the dewar that interface with the optics within the dewar.

Request for Wording Changes to ITAR XII (c)(9)
We recommend that integrated IRFPA dewar cooler assemblies (XII(c)(9)) be removed from ITAR control or reworded to remove ITAR controls on commercial or custom components made for non-military, scientific purposes.

Comments on ITAR XII (c)(17)
While certain telescopes do not meet this description the components could be rearranged to meet or exceed these technical parameters. Six meter telescopes may likely exceed these technical parameters. We recommend that the technical parameters be increased. We recommend that the mirror size be changed to be greater than 8.4m to recognize the existence and operation of presently operating observatories such as Keck and the Large Binocular Telescope.

Comments on ITAR XII(e)
This section has similar concerns to XII(c)(9) and is overly broad in its controls. It does not specifically state what technologies need to be controlled or specify the end uses of that technology.

XII(e)(7)(i) - Stirling cryocoolers are based upon technology that was conceived in the 1800s, have been produced since the mid-1900s and are well-described in the public domain. Protecting this technology would not appear to improve national security.

Request for Wording Changes to ITAR XII (e)(7)(i)
Stirling cryocoolers should be exempted even though they may meet the specifications as described in this section.

Comments on ITAR XII(e)(7)(iv)
Dewars that are specially designed for IRFPAs for non-military purposes (astronomy) impart little, if any, information regarding the technology of the IRFPA that is not already described in the literature (for the particular IRFPA being used). Controlling the dewar because of its use with a controlled IRFPA can provide similar concerns as described in Comments on ITAR XII(e)(9) below.

Comments on ITAR XII(e)(9)

This section should consider the application of the parts and components. A land-based astronomical telescope that contains an IRFPA would likely include numerous optical elements including lenses, beam splitters, mirrors, filters, gratings and etalons, many of which could be treated or coated in specific manners.

It can be difficult to find a company to make custom optical elements for such a scientific device when considering process capabilities (of the company to make a specific element), quality considerations, overall cost and delivery schedules. In some instances, the best candidate may be a foreign vendor. An export license would be required to export the design specification as technical data for the manufacture of these components and would increase Agency and project workload, solely because these elements are to be used with an IRFPA.

Also, domestic vendors that produce such optical elements may need to review their staffing to determine whether a license is required for any foreign persons working within their facility. Alternatively, they may decide that they will not supply optics for equipment that contains ITAR components due to the overhead costs in supporting that activity. Any of these scenarios could compromise a research organization's ability to procure or create high quality optical elements. This issue also would increase the regulatory burden on the research project, vendor and Agency with no likely national security impact.

XII(e)(9) – This paragraph is overly broad in that it can include optical elements that are not enclosed or attached to the IRFPA dewar cooler assembly. This could be read to include all optical elements within the beam path of a scientific instrument.

In some cases foreign graduate students may be developing these custom optical elements as part of their studies and are actively participating in the manufacture of these items in machine shops at universities all under the auspices of fundamental research.

XII(e)(10) – The signal or image processing electronics may require custom electronics and software to produce a scientifically usable image when used with an IRFPA in an astronomical telescope. The application of the IRFPA should be considered when reviewing what is controlled. Uses that are not considered military should not be controlled under the ITAR, particularly for parts and components used in association with a controlled IRFPA.

If we look collectively at sections XII(c)(2)-(9), XII(e)(7) and XII(e)(10) and consider their application to a land-based astronomical telescope using a controlled IRFPA, the entire functional portion of the telescope would be controlled regardless of whether the assemblies, parts and components were custom or commercial items, merely because they are used with an IRFPA. The list of items that would need to be controlled include mirrors, lenses, beam splitters, coatings/treatments on optics, filters, gratings, etalons, dewars, cooling systems for dewars, controllers for the cooling systems, imaging electronics, image processing hardware and software, and any electronics interfacing with the IRFPA.

In a telescope, this may require the control of tens to hundreds of parts, which would be a severe hardship on a research institution or university. Vendor control would be extremely hard to manage and may result in some vendors not wanting to manufacture parts (for such ITAR controlled projects), thereby limiting the research institution's ability to source quality parts and components.

We consider the control of all of these components because of their association with an IRFPA to be a severe overreach that provides no particular additional security regarding the technology the government wishes to control, namely the IRFPA.

Since the entire imaging chain of the telescope would be controlled, publication of the design of the telescope would not be possible, thereby preventing researchers from advancing the design knowledge in their field (it would be a defacto publication restriction). Secondly, it may prevent universities or research institutions from taking on such a project due to the potentially extreme regulatory burdens of the project. In many instances, research instrumentation is developed by consortiums of domestic and foreign collaborators. The sort of regulatory controls described in the proposed regulations could lead to a substantial increase in licensing due to foreign collaborations.

This overreach on systems containing IRFPAs and associated parts and components is similar to Category XV for space technology prior to export control reform. If entire space systems, parts and components were moved from the USML to the CCL, why is the U.S. government putting commercial and research items by association with IRFPAs under munitions controls?

Request for definition on ITAR XII(e)(13)

Resonator needs to be defined. It is unclear if this is for a resonator for gain.

Request for Wording Changes to ITAR XII (c), (e) and (f)

An exemption to sections XII(c) and XII(e) should be made for assemblies, parts and components that are used in conjunction with an IRFPA for land-based astronomical and other non-military uses.

XII(f) – Technical data associated with assemblies, parts and components used in conjunction with a IRFPA for land-based astronomical telescopes and other non-military uses should be exempted from these requirements as described in section XII(c) and XII(e) above.

AUECO appreciates the opportunity to provide the Department of State with the above comments on ITAR Amendment—Category XII to enable the government to understand how the technologies we are developing and using are being impacted by export controls. The research enterprise in the United States is critical to the economic advancement of our country and having export regulations that are not overly broad ensure that innovation is not stifled in performing fundamental research.

Sincerely,

Mary Beran

AUTO ALLIANCE

DRIVING INNOVATION®

July 6, 2015

By Email (DDTCPublicComments@state.gov)

Ms. Rose E. Gottemoeller
Under Secretary, Arms Control and International Security
U.S. Department of State
Washington, DC 20522

Re: ITAR Amendment – Category XII

Dear Secretary Gottemoeller:

The Alliance of Automobile Manufacturers, or Auto Alliance ("Alliance"), appreciates the opportunity to comment on the proposed rule amending Category XII of the U.S. Munitions List, as published by the Directorate of Defense Trade Controls ("DDTC") on May 5, 2015. 80 Fed. Reg. 25821 (2015). In its proposed form, the amendment would impair important safety-related research and development by the civil automotive industry. These comments suggest revisions to the proposed rule to ensure that it meets its intended exemption of civil automotive applications.[1]

The Alliance is an association of 12 vehicle manufacturers, including BMW Group, Fiat Chrysler Automobile US, Ford Motor Company, General Motors Company, Jaguar Land Rover, Mazda, Mercedes-Benz USA, Mitsubishi Motors, Porsche, Toyota, Volkswagen Group of America, and Volvo Cars North America. The Alliance is America's leading advocacy group for the automotive industry; its members account for 77 percent of all car and light truck sales in the United States. The Alliance is committed to developing and implementing constructive solutions to public policy challenges that promote sustainable mobility and benefit society in the areas of the environment, energy, and motor vehicle safety.

Light detection and ranging ("LIDAR") systems are one of the most promising technologies for obstacle detection and avoidance and the reduction of rear-end and head-on auto accidents. The National Highway Traffic Safety Administration estimates that rear-end collisions each year result in over $15 billion in U.S. economic losses. U.S. Department of Transportation, "Connected Vehicle Insights: Trends in Roadway Domain Active Sensing," FHWA-JPO-13-086, at 1 (August 14, 2013) ("DOT Report"). These estimated losses would be even greater if head-on collisions were included. Furthermore, the U.S. Department of Transportation estimates that human errors are the cause of more than 75 percent of all auto accidents. DOT Report at 10. Automotive LIDAR systems (particularly in higher automation applications, SAE J3016 Level 3

[1] One or more Alliance members may submit their own comments independently of these.

and above) have the potential to mitigate, or even eliminate, the human error factor that could result in rear-end or head-on auto accidents. These systems could enhance substantially the safety of such common driving situations as merging into high-speed highway traffic or approaching from the rear a broken-down vehicle in a highway lane or using as a passing lane a lane used by oncoming traffic.

We note that the proposed rule seeks to exempt from the scope of Category XII those LIDAR systems for civil automotive applications. 80 Fed. Reg. at 25825 (referring to LIDAR in paragraph (b)(6) of proposed Category XII but adding in a note: "This paragraph does not control LIDAR systems or equipment for civil automotive applications having a range limited to 200 m or less."). But there are several aspects of the exemption as proposed that would actually constrain the development of LIDAR systems for civil automotive applications.

First, the proposed range limitation of 200 meters is too restrictive. Automotive LIDAR systems with a range in excess of 200 meters are already in the development stage. The longer range is necessary for object detection that achieves safety in the kinds of situations described above. Vehicle braking distance depends on a number of variables, such as mass of the vehicle, quality of the tires, character of the road (surface conditions, grade, curvature), weather, and others. A typical passenger vehicle traveling at 60 miles per hour has a braking distance of around 143 meters in ideal conditions, but that braking distance exceeds 400 meters in worse conditions. See http://blog.esurance.com/stopping-distance-is-the-3-second-rule-wrong/#.VZF9g_lVhBc (distances in feet are converted to meters at the conversion rate of 3.28 feet per meter). Notably, vehicle speeds on most major highways often exceed 60 miles per hour, due to higher posted speeds and to actual speeds in excess of the posted speeds. Furthermore, if vehicles are approaching each other, as could be the case where a vehicle is using an oncoming traffic lane as a passing lane, the convergence could be much faster than 60 miles per hour, and it would be imperative to begin stopping at a correspondingly longer distance. Finally, since a vehicle's acceleration capability is typically less than its deceleration capability, acceleration-based maneuvers, such as merging into moving traffic or crossing a road with high-speed traffic, require even greater distance-of-view than does deceleration. For these reasons, we recommend that the civil automotive exemption should use a range of at least 400 meters.

Second, the proposed range limitation does not distinguish between reflective and non-reflective objects. The detection range of a LIDAR system varies depending on the reflectivity of the object in view. A LIDAR system can perceive a reflective traffic sign, for example, at a much longer distance than a downed tree or a pedestrian. Therefore, we recommend that the civil automotive exemption should specify that the range relates to non-reflective objects, since a range that relates to reflective objects would leave the exempt range for pedestrians much shorter.

Third, the proposed exemption for LIDAR with civil automotive applications is undermined by the proposed controls on critical components of LIDAR systems. Automotive LIDAR systems often incorporate Geiger-mode detector arrays (proposed to be controlled by Category

XII(b)(8)(iii)); infrared focal plane arrays ("IRFPAs") (proposed to be controlled by Category XII(c)(2), (3), (4), and (6)); infrared imaging camera cores (proposed to be controlled by Category XII(c)(12)); and readout integrated circuits ("ROICs") (proposed to be controlled by Category XII(e)(4) and (5)). For example, in order for an automotive LIDAR system to be capable of determining the size, shape, direction, and velocity of an object while the LIDAR-equipped vehicle is moving, the LIDAR system must incorporate an IRFPA. Since an item containing an ITAR-controlled component is subject to ITAR control itself, automotive LIDAR systems containing an IRFPA or any other of the above controlled components could be considered subject to ITAR controls despite the civil automotive exemption.

To avoid any confusion on this score, we recommend that the exemption in Note 1 to paragraph (b)(6) expressly include components of LIDAR systems with civil automotive applications. We also recommend that the Note to paragraphs (b)(4) and (b)(6) through (8) be revised to exempt Geiger-mode detector arrays incorporated into civil automotive LIDAR systems, that Note 1 to paragraph (c)(2) be revised to exempt IRFPAs incorporated into civil automotive LIDAR systems, that paragraph (c)(12)(viii) be revised to increase the resolution standard to 327,680 detector elements (the standard video graphics array is already 307,200 pixels, and 327,680 is the next higher resolution), and that the Note to paragraph (e) be revised to exempt ROICs incorporated into civil automotive LIDAR systems.

We note that the technology that we are recommending be expressly included in the civil automotive exemption is widely available abroad. For example, Chunghwa Leading Photonics Tech, a division of Chungwha Telecom Co., Ltd. in Taiwan, Cox Co., Ltd. in Korea, and Xenics NV in Belgium offer IRFPAs with wavelengths in the range of 800-1700 nm. More generally, automotive LIDAR systems are being developed in China, Germany, and Japan, among other countries.

For the foregoing reasons, we recommend that the proposed rule be revised, in relevant part, as follows:

(1) Note 1 to paragraph (b)(6) should read as follows: *"Notwithstanding any other provisions of this category, ITAR does not control LIDAR systems and equipment, nor parts or components of such systems and equipment, for civil automotive applications having a range limited to 400 m or less for non-reflective objects."*[2]

---

[2] The proposed paragraph (b)(6) controls both LIDAR and LADAR systems, but the proposed civil automotive exemption mentions only LIDAR systems. Since LIDAR and LADAR are essentially interchangeable technologies, we recommend that DDTC add a reference to LADAR in Note 1 to paragraph (b)(6) as well as in related civil automotive exemptions recommended in these comments.

(2) Note to paragraphs (b)(4) and (b)(6) through (8) should include a concluding sentence as follows: *"Geiger-mode detector arrays described in paragraph (b)(8) and incorporated into civil automotive LIDAR systems are exempt pursuant to Note 1 to paragraph (b)(6)."*

(3) Note 1 to paragraph (c)(2) should include a concluding sentence as follows: *"IRFPAs described in paragraph (c) and incorporated into civil automotive LIDAR systems are exempt pursuant to Note 1 to paragraph (b)(6)."*[3]

(4) Paragraph (c)(12)(viii) should read as follows: *"A two-dimensional photon detector IRFPA described in paragraph(c)(2) or (4) of this category having a peak response within the wavelength range exceeding 900 nm but not exceeding 2,500 nm, and greater than 327,680 detector elements."*

(5) Note to paragraph (e) should include a concluding sentence as follows: *"ROICs described in this paragraph and incorporated into civil automotive LIDAR systems are exempt pursuant to Note 1 to paragraph (b)(6)."*

The foregoing revisions would ensure that the ITAR does not impair research and development that, while not advancing any military applications, could have significant benefits for civil automotive safety.

We appreciate the opportunity to submit these comments and would be pleased to answer any questions that DDTC may have with regard to our recommendations.

Sincerely yours,

Will Otero
Director, Transportation and Safety Policy

[3] Pursuant to this recommendation, we urge DDTC to communicate with the Bureau of Industry and Security to delete the proposed comment in Note 3 to Export Control Classification Number 6A002.a.3 that focal plane arrays that are not in a permanent encapsulated sensor assembly "are subject to the ITAR." 80 Fed. Reg. 25798, 25812 (2015).

Subject: RIN 0694-AF75

Ladies and Gentlemen:

On behalf of Autoliv ASP, Inc., the U.S. subsidiary of Autoliv, Inc. ("Autoliv"), I am sending this letter as our public comments to your proposed revisions to the Export Administration Regulations ("EAR") and International Traffic in Arms Regulations ("ITAR"), requested in your May 5, 2015 Federal Register notices.

I. Autoliv's Safety Products for the Civil Automotive Industry

Autoliv is the worldwide leader in civil automotive safety systems, and develops and manufactures civil automotive safety systems for all major civil automotive manufacturers in the world, including airbags, seatbelt devices, night vision, and other passive and active safety systems. Together with its joint ventures, Autoliv has more than 80 facilities with more than 60,000 employees in 28 countries. In addition, the Company has ten technical centers in nine countries around the world, with 21 test tracks, more than any other automotive safety supplier. Sales in 2014 amounted to US $9.2 billion. Autoliv estimates that its civil automotive safety products save over 30,000 lives every year, and prevent 10 times as many severe injuries. Autoliv's electronics facility in Goleta, California, designs, develops, and produces civil automotive night vision systems that likewise save lives across the globe. The use of infrared cameras in the civil automotive market has grown throughout the past 10 years. From the first systems which provided an image to drivers allowing them to see 3 to 5 times farther than their headlamps, to the current systems providing the driver with warning of pedestrians and animals in the path of vehicle, Autoliv's night vision cameras have made civil automobiles safer.

There are over 100,000 pedestrian fatalities and more than 1.5 million car-deer accidents globally each year. Nearly 70 percent of these fatalities happen at night. Our night vision camera systems are instrumental in reducing accidents and saving lives of pedestrians, vehicle occupants and animals.

The use of our infrared cameras in civilian passenger land vehicles continues to grow as the civil automotive market continues its path to providing safer vehicles. The U.S. Tech Choice Study published by JD Power in April 2015 identified night vision as the second most preferred civil automotive technology (behind only "blind spot detection and prevention"). MarketsandMarkets recently reported that by 2019 the automotive night vision system market will reach $2.5 billion and the automotive driver monitoring system market will reach $4.9 billion. Infrared cameras will also assist in achieving autonomous driving vehicles in the future.

II. General Comments Regarding Proposed Rules

Because of this increased usage of infrared sensors and cameras to improve safety and save lives in the civil automotive market, we respectfully request that both the Department of State and the Department of Commerce consider relaxing the current export requirements for civil automotive infrared components, technology, software, and systems. The proposed rules, in contrast, appear to impose additional constraints and complexity that we believe are not necessary, particularly in light of the current, effective EAR and ITAR controls on related hardware, software and technology.

Our civil automotive OEM customers have successfully committed themselves to compliance with the existing export control regulations, and they also have found the proposed rules to be both confusing and more restrictive. Some already have suggested looking outside the United States to meet their future infrared sensor and camera needs for civilian passenger land vehicles in order to avoid the confusing and restrictive language being proposed. There are currently sensor and camera manufacturers delivering these civil products without such restrictions in France (please see: www.ulis-ir.com), China (please see: www.dali-tech.us , http://www.militram.com/category/articles/cameras-articles/beam-profilers-cameras/thermal/uncooled/ , http://www.suncti.com/en/index.aspx) and Japan (please see: http://www.solteccorp.com/).

III. Specific Comments Regarding Proposed Rules

Autoliv makes infrared cameras specially designed for installation in civilian passenger land vehicles, and those cameras are classified in the Commerce Control List ("CCL") under ECCN 6A993.a. because our cameras meet the criteria of Note 3 to ECCN 6A003.b.4. and related Wassenaar Arrangement provisions, including an anti-tamper mechanism. Our cameras include infrared focal plane arrays (IRFPA's) that, if exported separately, are controlled under the current U.S. Munitions List ("USML") Category XII(c), but are subject to EAR controls when exported as part of our civil automotive cameras, in accordance with the current USML Category XII(c). These ITAR and EAR provisions have worked well to ensure export compliance, in addition to providing a "bright line" between the USML and the CCL for the control of our products.

In contrast to the current regulations, the proposed USML Category XII(c) items related to Autoliv's civil automotive products, and the related proposed Note 2 to paragraph (c) and proposed Note to paragraph (e) appear to us to be confusing. Under the proposed USML Category XII(c) provisions, our civil automotive cameras would include IRFPA's that are incorporated into permanent encapsulated sensor assemblies (including a "vacuum package") that are incorporated into camera cores that are incorporated into our ECCN 6A993.a. cameras, which include also infrared lenses and processing electronics.

Under the proposed rules, the IRFPA's would be controlled under Category XII(c)(2), but once integrated into a permanent encapsulated sensor assembly, they would be controlled under Category XII(c)(4), having greater than 256 detector elements. The camera core into which the Category XII(c)(4) IRFPA is incorporated would be classified under Category XII(c)(12)(ix). Once our microbolometer IRFPA has greater than 328,000 detector elements and is in a permanent encapsulated sensor assembly, it would be controlled under Category XII(c)(5). The camera core into which the Category XII(c)(5) IRFPA is incorporated would be classified under Category XII(c)(12)(iii). Once the vacuum packages under Category XII(c)(4) and Category XII(c)(5) are incorporated into a camera core, it appears that they also would be classified under Category XII(e)(6). The infrared lenses would be classified under Category XII(e)(9), and the processing electronics would be classified under Category XII(e)(10). We found these multiple alternative classifications to be confusing.

Autoliv Electronics Night Vision

Goleta, CA 93117 USA

Phone +1 805 571 1777
Fax +1 805 571 1779
www.autoliv.com

Autoliv

In addition, in order for our civil automotive camera, which includes a camera core, permanent encapsulated sensor assembly, IRFPA, infrared lens, and processing electronics, to meet the requirements for EAR control under the proposed Category XII Note 2 to paragraph (c) and Note to paragraph (e), the "article" "cannot be removed without destruction or damage to the article or render the item inoperable." It is unclear whether the "article" or the "item" is the camera, the camera core, the permanent encapsulated sensor assembly, the IRFPA, the infrared lens, or the processing electronics. It also is unclear how the two Notes would or would not permit the export of our currently ECCN 6A993.a cameras for installation in civilian passenger land vehicles. All of these "articles" or "items," other than the IRFPA's, can be removed without damage or destruction. If our civil automotive camera is disassembled, all of these "articles" or "items" would become inoperable in the sense that they only work together as a civil automotive camera, but each component remains operable in the sense that it could be used subsequently in an assembled system. In general, all components making up our ECCN 6A993.a. cameras that meet the requirements for civilian passenger land vehicles under Note 3 to ECCN 6A003.b.4., including the anti-tamper mechanism, should remain under EAR control, rather than ITAR control.

Regarding the wording on shock requirements at proposed Category XII(c)(12)(ii), the civil automotive market has high quality requirements to prevent such defects that may cause harm to the driver, occupants or pedestrians. The automotive shock requirements vary by OEM but are approximately 100g, 11ms, half sine, and we do not measure beyond these requirements. It is unclear whether our products will meet the shock level stated in the proposed rules, and we suggest the wording be clarified to allow ECCN 6A993.a. cameras to remain under EAR control as long as they meet the related civil automotive requirements currently in place for civilian passenger land vehicles.

Regarding the proposed removal of License Exception STA eligibility for technology classified under ECCN's 6E001, 6E002 and 6E994, Autoliv has successfully ensured related export compliance through the proper use of License Exception STA with our eligible customers, our affiliate companies in Sweden, Germany, and Canada, and our Canadian national employees. Use of that license exception should remain available for our eligible employees and affiliate companies. License Exception STA also should remain available for our eligible customers in order to permit the parties to verify the quality of the products' design and manufacturing for end use in civilian passenger land vehicles. Our customers must have the ability to tour our facility and verify quality requirements for our cameras, optics, electronics, and integration of the IRFPA, all of which is limited to ECCN 6E001 and 6E002 technology for cameras (we do not share with our customers sensor technology controlled under ECCN 6E001 or 6E002, or ROIC technology controlled under ECCN 6E990). That need has been met – and can continue to be met - in a successful and compliant manner through the use of License Exception STA.

In addition, Autoliv designs and develops software for the manufacture, testing, and operation of our ECCN 6A993.a. cameras. We likewise have used License Exception STA in a successful and compliant manner to meet related needs with our affiliate companies in Sweden, Germany, and Canada, and our Canadian national employees. License Exception STA should remain available for this purpose as well.

Autoliv

IV. Conclusion

The current Category XII(c) and related EAR provisions have worked in an effective manner to ensure export compliance with our customers, employees, and affiliate companies. Autoliv's products include strong and effective anti-tamper features to disable our cameras when removed from the civilian passenger land vehicles for which they have been designed and are used. We hope that DDTC and BIS will either reduce the current controls for our civil automotive cameras, or at a minimum maintain the current language in the ITAR and EAR. Thank you for your attention to these comments and suggestions. Please contact Richard Seoane at (805) 562-5930 or richard.seoane@autoliv.com if you have any questions concerning this letter.

Sincerely,

Richard Seoane

From: Zimmer, Justin (US)
To: DDTCPublicComments
Subject: ATTN: Regulatory Change, USML Category XII
Date: Tuesday, July 07, 2015 11:02:53 AM

Comments submitted by BAE Systems, Inc.

In our meetings with the team members involved with USML XII products, the one cause for concern is the phrase "greater than ###" in USML XII and "less than ###" in ECCN 6A615 as it pertains to focal plane arrays (FPAs). For example:

- USML XII(c)(3) reads: One-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly, having greater than 640 detector elements
- CCL ECCN 6A615.g reads: Combat vehicle, tactical wheeled vehicle, naval vessel, or aircraft pilotage systems or equipment incorporating a variable field of view or field of regard, and incorporating a photon detector-based infrared focal plan array having less than 640 elements.

Neither the USML or CCL addresses "equal to 640", and some of our FPAs are at 640. This makes it unclear as to which regulation 640X480 microbolometer FPAs are controlled. Therefore, the consensus is that the language should be changed to include "equal to" in the regulation to which it pertains. If "equal to" is added to the USML, then we can determine that the 640X480 FPAs will remain export-controlled by State; if "equal to" is added to the CCL, then the 640X480 FPAs will move to Commerce.

Subject: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

June 22, 2015

To Whom It May Concern:

BaySpec, Inc.**,** founded in 1999 with 100% manufacturing in the USA (San Jose, California), is a vertically integrated spectral sensing company. The company designs, manufactures and markets advanced spectral instruments, including UV-VIS-NIR-SWIR spectrometers, benchtop and portable NIR/SWIR and Raman analyzers, confocal Raman microscopes, hyperspectral imagers, mass spectrometers, and OEM spectral engines and components, for the R&D, biomedical, pharmaceuticals, chemical, food, semiconductor, health monitoring, human & animal medical devices, fiber sensing, and the optical telecommunications industries.

Direct comparison of non-military products with USML entries are listed here:

1. We observed that the paragraph 12(c)(2) will classify unsealed linear array devices as ITAR, making the devices we receive from InGaAs vendors which are assembled into higher level fully enclosed channel monitors and fiber grating sensors interrogators, controlled items (see attached datasheets). To date, over the last 12 years, BaySpec has shipped over 40,000 such devices to the commercial telecom and fiber sensing markets. These devices provide a critical piece of the world's internet background and are used for vital structural health monitoring purposes.

2. We also note that arrays with over 640 elements linear array will also become ITAR. BaySpec received arrays with 640 or more elements from InGaAs vendors, which are assembled into higher level spectrometers for biomedical optical coherence tomography (see attached OCT-NIR datasheet) for ophthalmology.

3. We are reviewing the HSI product definitions too about the multi-spectral controls: "Multispectral IRFPAs in Permanent Encapsulated Sensor Assembly Ø Wavelength exceeding

1,500nm but not exceeding 30,000nm". BaySpec is not yet manufacturing hyperspectral imagers over 1500 nm, but have received strong customer interest, as longer wavelengths would naturally provide rich chemical information. If we manufacture in the future, these hyperspectral imagers would be targeted for use by our current customers in precision agriculture, pharmaceutical, and geological/mining survey markets.

For all products above, the target markets were for commercial applications and not specifically designed or in funded by or for military/defense/space purposes.

BaySpec also offers these same products to the military/defense market as commercial off-the-shelf (COTS) devices. Some of our customers include *Harris Corporation*, *NASA, General Dynamics AIS*, *Raytheon*, *Northrop Grumman* and the *U.S. Department of Defense*. If the new proposed changes come into effect, the cost for products will go up substantially to our domestic contractors and ultimately hurt the already strained U.S. budget and taxpayer burden.

BaySpec has international competitors that also source and assemble arrays into final products which are commercially available on the open market, so any additional ITAR classification will present U.S. based BaySpec with an undue burden of compliance adding extra costs and making U.S. products less competitive. A few examples of our competitors, *Ibsen Photonics* (Denmark, www.ibsenphotonics.com) manufacturers FBG interrogators using the same detectors, *Specim* (Finland, www.specim.fi) makes high pixel count hyperspectral imagers, *Horiba Scientific* (Japan/France, www.horiba.com) makes custom spectrometers using linear and two-dimensional arrays. BaySpec believes that the proposed wording will reduce incentives to buy made in USA products while greatly helping our foreign competitors.

The proposed rules, as such, would impact over 90% of BaySpec's product revenue. As a small business, BaySpec does not have the resources to fundamentally restructure its business in this highly competitive marketplace.

In conclusion, BaySpec suggests the following:

- Proposal should be fundamentally rewritten
- Specially Designed should be fully applied to this Category
    - As opposed to performance parameters
- USML should align with the Wassenaar Munitions list

If you require any further information, please contact me on behalf of BaySpec at (408)512-5960 or via email at ebergles@bayspec.com.

Description: BaySpec-new logo-25%

Optical Channel Performance Monitor

IntelliGuard® *OCPM Series*

BaySpec's OCPM Series Optical Channel Performance Monitor is an embedded, integrated spectrum analyzer delivering precise measurement and powerful processing capabilities for dense wavelength division multiplexing (DWDM) applications.

The device covers C and/or L band wavelength ranges and provides simultaneous measurements of up to 160 channels spaced 50 GHz apart. High reliability (GR-63/1209/1221 qualified) is achieved through a rugged mechanical design with no moving parts. Periodic calibration is not required. Input/Output (I/O) is provided through a dual port RAM interface accessed through ADD/DAT bus direct connection or serial (RS232 or USB) communications.

The *IntelliGuard*® OCPM Series employs a highly efficient Volume Phase Grating (VPG®) as the spectral dispersion element and an ultra-sensitive InGaAs array detector as the detection element, thereby providing high-speed parallel processing and continuous spectrum measurements. As an input, the device uses a tapped signal from the main data transmission link through a single mode fiber, then collimating it with a micro lens. The signal is spectrally dispersed with the VPG®, and the diffracted field is focused onto an InGaAs array detector. The control electronics read out the processed digital signal to extract required information. Both the raw data and the processed data are available to the host through the chosen interface.

Key Features:

- Real-time <1 ms response time for raw data
- Remote gain equalization of DWDM networks based on optical power or OSNR
- High dynamic range - 50 dB
- High reliability - no moving parts and GR-63/1209/1221 qualified
- Athermal design for ultra-low power consumption
- Compact for new system space constrained environments 68 x 96 x 15.8 mm^3; legacy designs available upon request
- Supports different modulation schemes for 10/40/100 GHz transmission

Applications:

- EDFA gain balancing
- Optical add/drop monitoring
- Physical layer monitoring for provisioning and commissioning optical networks
- Real time fault detection and isolation in DWDM systems
- Channel power, wavelength and OSNR measurement
- OEM module for field test equipment

Compliance

- Telcordia GR-63/1209/ GR-1221 qualified

High Speed FBGA Analyzer

WaveCapture® FBGA Series

BaySpec's *WaveCapture*® FBGA Interrogation Analyzer is an integrated spectral engine simultaneously covering multiple wavelengths for precise and Rapid Fiber Bragg Grating (FBG) sensor system measurements.

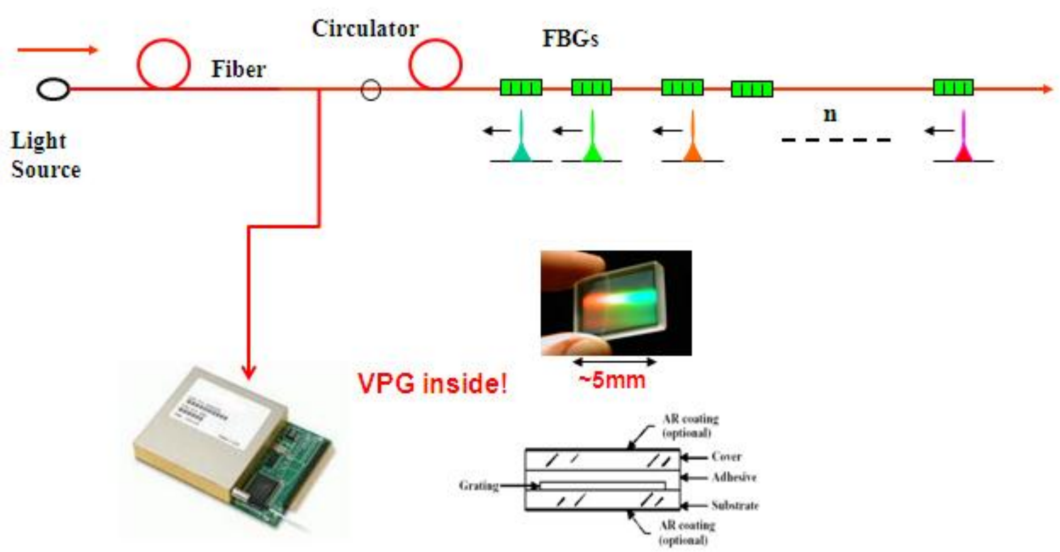
The device covers wide wavelength ranges and provides simultaneous measurements at very fast response rates and excellent wavelength resolution. High reliability (MIL STD 810F shock and vibration) is achieved through a rugged mechanical design with no moving parts. Periodic calibration is not required. High speed Input/output (I/O) is achieved through the use of USB2.0 communications (serial communications also supported at lower speeds).

The *WaveCapture*® FBGA Series employs a highly efficient Volume Phase Grating (VPG®) as the spectral dispersion element and an ultra-sensitive InGaAs array detector as the detection element, thereby providing high-speed parallel processing and continuous spectrum measurements. As an input, the device uses a tapped signal from the main data transmission link through a single mode fiber, then collimating it with a micro lens. The signal is spectrally dispersed with the VPG®, and the diffracted field is focused onto an InGaAs array detector. The control electronics read out the processed digital signal to extract required information. Both the raw data and the processed data are available to the host.

Key Features

- Wide wavelength range
- Ultra-fast response time (up to 5kHz)
- Excellent wavelength repeatability and resolution
- Athermal design enabling battery-operated portable operation
- High reliability for use in harsh environment
- Compact, card-mountable design

Fiber Bragg Grating (FBG) Sensing



Consider using with:

- Mini-Wide Light Sources
- ASE Light Sources
- Fiber-optic Bundles & Accessories

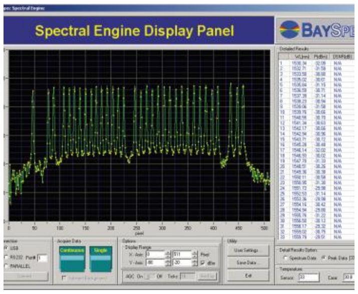
High Speed FBGA Analyzer

WaveCapture® FBGA Series

Specifications	Data	Unit
Standard Wavelength Ranges*	Standard: 1525-1565 Extended: 1510-1590	nm
Wavelength Repeatibility	± 5	pm
Wavelength Readout Resolution	1	pm
Minimum Detectable Wavelength Change	± 1	pm
Frequency response time (typ.)	Standard: ~5 Hz (RS232/USB1.1) Fast: ~5 kHz (USB2.0)	
Channel Input Power Range	-60 to −20 or specify	dBm
Power Resolution	0.1	dB
Size	96 x 68 x 15.8	mm^3
Interface	RS232 or USB (Fast board USB only)	
Operating Temperature	-5 to +70	°C
Software	BaySpec's *Sense 2020* evaluation software included, SDK for development	

* Other wavelengths available upon request

Sense 2020 Software



BaySpec's *Sense 2020* software included, a Windows-based package with flexible data acquisition, processing and output functionality

BaySpec SDK, a software development kit for new applications development and integration into to your host software systems.

Spectral Domain OCTS Engine

DeepView® OCT Long-wavelength Series

OCT Lone-wavelength Series spectral engine shown with example camera

BaySpec's all new *DeepView*® Fourier or Spectral-Domain OCT Spectral Engine is an InGaAs line scan camera with an integrated *VPG*®-based Spectrograph simultaneously covering multiple wavelengths for precise and rapid optical coherence tomography measurements.

The *DeepView*® Spectral Engine provides convenience for researchers and OEM users assembling fourier or spectral-domain optical coherence tomography (SD-OCT), white light interferometry (WLI) or VIS-NIR spectroscopy systems. This flat-field spectral analyzer design is based on highly efficient transmission *Volume Phase Grating* (VPG®) and mounts on an ultra-fast digital line scan camera. The spectral engine accepts single-mode fiber optic inputs and is customizable via grating inserts to match the spectral bandwidth and center wavelength of the users' light source.

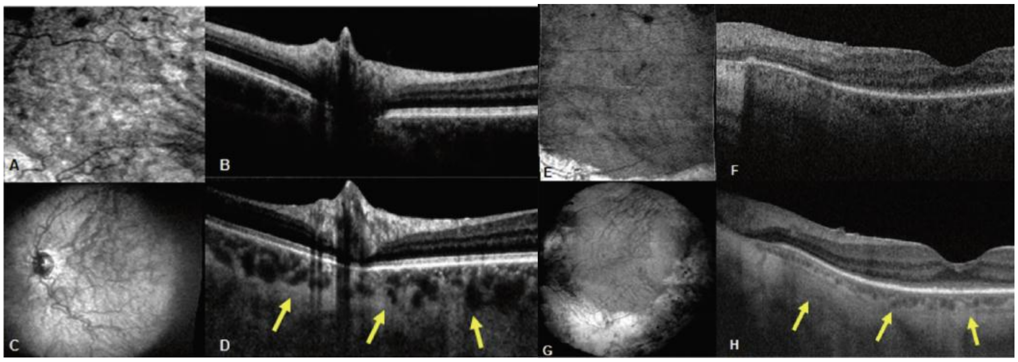
The OCTS NIR Series spectral engine employs a highly efficient *Volume Phase Grating* (VPG®) as the spectral dispersion element and an ultra-sensitive InGaAs array detector as the detection element, thereby providing high-speed parallel processing and continuous spectrum measurements. The signal is spectrally dispersed with the *VPG*®, and the diffracted field is focused onto an InGaAs array detector. The control electronics read out the processed digital signal to extract required information. Both the raw data and the processed data are available to the host.

Applications:

- High-speed spectral OCT for cancer detection in the biologically interested wave bands of 0.8-2.2 μm range
- High-resolution NIR spectral OCT in retinal diagnostics and measurements in ophthalmology
- Spectral OCT guidance on implant and surgery
- High speed and fast turn-around Spectral OCT assessment of surgical outcome
- Catheter/Endoscopic SD OCT image guided diagnostics, image-guided surgery, and image-guided therapy
- In vivo and in vitro general medical diagnostics and imaging
- In vivo and in vitro operation room and surgical procedure Quality Assurance
- Non-invasive skin cancer and skin disease diagnostics and detection
- Industrial applications such as non-destructive testing

Key Features:

- Rugged and reliable spectrometer featuring no moving parts
- Highly-efficient, high-resolution Volume-Phase Grating®
- Flexible options for center wavelength and spectral bandwidth, selectable at time of order; contact factory for custom solutions and packaging with NIR camera.
- Grating and optical bench customizable for your light source and application
- Single-mode fiber coupled inputs; other input fiber options available



3D Optical Coherence Tomography (OCT) at 800 and 1060nm of (A)–(D); a normal retina and (E)–(H) a patient with retinitis pigmentosa. (A, E) En-face zoomed-in fundus image of the choroid using 1060nm 3D OCT. Arrows indicate enhanced choroidal visualization. (Courtesy Cardiff University)

Subject: ITAR Amendment - Category XII

Relationships to Wassenaar Dual Use List

Two of the four singles in the original Export Control Reform Initiative were a single control list and a single agency to administer the controls. Proposed USML Category XII goes a long way in the opposite direction.

The following relationships between USML Category XII and CCL ECCNs to comply with the Wassenaar Dual Use List are technically so close as to suggest they should be controlled by only one agency, rather than two. The Department of Commerce has staff in BIS with many years of experience in these technologies. BIS would have to retain such staff. Only portions of these items would be transferred to DDTC in the Department of State. It would be needlessly expensive to duplicate this expertise in DDTC.

This analysis is incomplete. It may omit some commodity overlaps and does omit all related software and technology. The extent of the USML/CCL overlap for software and technology is particularly unclear, largely because "directly related" in XII.f is not defined but also because software and technology is largely common for two technically closely related commodities, one on the USML and the other on the CCL.

Regardless of agency jurisdiction in the United States, the technical descriptions in the proposed USML Category XII indicate levels of military significance which could be put to good use in Wassenaar negotiations to revise its Dual Use List.

It is recommended that each of the following portions of proposed USML XII (and others like them) be removed from that proposal and, instead, be incorporated in U.S. proposals to revise the Wassenaar Dual Use List:

USML XII	CCL ECCN
b.6	6A008.j
b.7	6A008.d
b.8.iv	6A008.j.2
b.10	6A005.c.3.b, d.1.b.2

* In XII.d.1 Note delete

> "For aircraft and unmanned aerial vehicle guidance or navigation systems, see USML Category VIII.e."

Instruction 2, on page 25825 of the May 5, 2015 Federal Register, proposes to remove and reserve Category VIII.e.

Relationship to 0A987 and 0E987

Proposed XII.a.1 fire control and XII.f for XII.a.1 could be construed to cover all of 0A987 and 0E987. This is because all of the sub-items of WML 5 are under the WML 5 heading of "fire control, and related (items)." In order to brighten the distinction between 0A987 and 0E987 and USML XII, it is reommended that

1. "for weapons controlled on the USML" be added to the heading of USML Category XII;
2. "not controlled by USML Category XII" be added to the headings of 0A987 and 0E987.

Missile Technology

Change "MT" to the MTCR citation plus references to CCL ECCNs which cover the portions of the MTCR items not controlled by the USML and add to those ECCNs "not controlled by (the relevant USML citation),"as follows:

b.4 MTCR 2.A.1.d and11.A.3; ECCNs7A117, 7A005, 7A105

(The MT description in XII.b.4 targeting and guidance omits the MTCR 2.A.1.d guidance set accuracy of equal to or less than 3.33% of range. 2.A.1.d overlaps not only XII.b.4 but also many other parts of XII.a, b, and d. Even so, 2.A.1.d is broader than all these parts of XII combined, because of other limiting features therein which are not included in 2.A.1.d.
The MT portion of XII.b.4 (for "missiles") as it relates to XII.d on GNSS is consistent with MTCR 11.A.3.a for "missiles." For comments on 11.A.3.b, see d.6 below.)
(Therefore, it is recommended that:
7A117 be revised to delete "These items are subject to the ITAR" and to insert "not controlled by USML XII" after "Guidance sets.")

b.6, b.7, b.8 MTCR 11.A.1; ECCNs 6A008, 6A108.a, 7A006, 7A106

(There is no MT problem re b.6,7,8 in the proposed rule.)

(It is recommended that:

1 7A106 be revised to delete "These items are subject to the ITAR."

2. Since XII.b.6,7,8 make no mention of altimeters and 7A006 makes no mention of ITAR and absent a clarification to the contrary, there appears to be no need to add "not controlled by USML XII.b.6,7,8" to the 7A006 or 7A106 altimeter controls.)

c.16.ix No MTCR item found

(<u>It is recommended</u> that MT be deleted from c.16.ix.)

d.1 MTCR 9.A.7; ECCN 7A103.c

(MTCR 9.A.7 is limited to navigational accuracy 200 m CEP or less)

(<u>It is recommended</u> that MT be revised to include navigational accuracy 200 m CEP or less and be moved from d.1 to d.1.i.)

d.2 MTCR 9.A.3, 9.A.5; ECCNs 7A001, 7A101

d.3 MTCR 9.A.4; ECCNs 7A002, 7A102

(MT missing from proposed rule)

(<u>It is recommended</u> that MT be added to d.3.)

d.4 MTCR 12.A.3.a; ECCNs 6A007.b, 6A107.a

d.6, d.7 MTCR 11.A.3; ECCNs 7A005, 7A105

(d.6.i, is for military application, which comes from MTCR 11.A.3.b.2; but the high speed MT description of d.6.i comes from MTCR 11.A.3.b.1 which omits military application.)
(d.6.ii encryption or decryption comes from MTCR 11.A.3.b.2 which includes for military or governmental services but includes only decryption, omitting encryption.)
(d.6.iii null steering antenna and d.7 anti-jam come from MTCR 11.A.3.b.3; but the proposed rule omits an MT description and 11.A.3.b.3 is broader than d.7.)
(d.6.iv is substantively the same as MTCR 11.A.3.a.)

(Therefore, <u>it is recommended</u> that:

1 d.6.i be revised to apply to high speed instead of military;
2 d.6.ii be amended to apply to encryption or decryption for military applications;
3 b.4 MT be expanded to apply not only to “missiles” but also to airborne applications at speeds in excess of 600m/s, decryption for military or governmental services, or anti-jam features;
4 7A005 heading “after (GNSS) receiving equipment” insert:
“not controlled by USML XII.b.4 or d.6"
5 7A005 Related Controls delete:
“(2) For equipment “specially designed” for military use, see Categories XI and XV of the U.S. Munitions List (22 CFR 121)”

6 7A105 heading be revised to apply to MTCR 11.A.3.b.3 “not controlled by USML XII.d.6.iii or d.7” instead of to MTCR 11.A.3.b.1
7 7A105 Related Controls delete:
“(2) See Categories XI and XV of the U.S. Munitions List (22 CFR 121.1) for controls on similar equipment “specially designed” for defense articles.”)

f. for b4 & d6 MTCR 2D3, 2E1, 11D2, 11E2; 7D101, 7E001,2, 7E101

f. for b6,7,8 MTCR 11D1, 11E2; 6D002, 6D102, 7D101, 6E001,2, 6E101,2, 7E001,2, 7E101

f. for c16ix No MTCR item found

f, for d1,2,3 9D1,3,4, 9E1; 7D002,3, 7D101, 7D102b,c, 7E001,2,3, 7E101

f. for d4 12E1; 6E101

Relationships to Wassenaar Munitions List

WML 5 includes the following which are not included in the March 5 proposed rule for USML Category XII:
5.b data fusion, sensor integration equipment (broader than XII.e..11.ii)
5.c countermeasure equipment for WML 5.a or 5.b (broader than XII.d.7, d.8)
5.d field test or alignment equipment specially designed for WML 5.a, 5.b, or 5.c.

Conversely, unlike the existing USML Category XII, the following portions of proposed Category XII are not limited by “for military use” (or the rough equivalent “for defense articles”) and are, therefore, broader than WML 5:
XII all of .a
XII.b except b.8.vi, b.9, b.14
XII.c except c.10, c.16.ix, c.21
XII.d except d.9
XII all of .e
XII.f for the above

Specially designed

The proposed Category XII text uses the non-technical phrase “specially designed” 48 times. This is much more frequently than in any of the other ECR-revised USML categories. Any use of “specially designed” on the USML deviates from the ECR positive list objective. The following indicates how most of the 48 uses could be removed:

1. Components described in XII.a-d,f (all of which should more logically be included in components sub-category XII.e):

9 specially designed parts and components therefor
(a.1, a.8, a.8.i, c.1, f Note 1, c.14, c.15, c.20, d.6)
All 9 could simply be deleted. They would then all be covered by 6A615.x. The result would be an increase in control. This is because the ITAR b.3 release from the catch-all definition of “specially designed” is broader than the EAR b.3 release and the EAR order of review giving a priority to USML coverage would mean that the stricter EAR control would apply under the proposed rule. To the extent applicable, alternatives to deletion would be to substitute technically described components or to change “specially designed parts and components therefor” to “components having the characteristics described therein.”

12 specially designed to incorporate:
(a.2, b.4 (2x), b.6, b.8.i, b.8.iii, c.13, Note 1 to c.13, c.14, c.15, c.16, Note 1 to f)
One wonders why it should be necessary to control all these items when they do not actually incorporate the component of concern. However, to the extent that this may be justified, it can more reasonably be accomplished by deleting “specially,” so that the releases in the definition of “specially designed” would not apply if the item is, in fact, designed to incorporate the component of concern. On the other hand, neither specially designed nor designed could, from a practical standpoint, be determined for a.2.ii or b.6 (any article subject to, or controlled by, this subchapter) or c.14, c.15, or c.16 (any article controlled in this category). Moreover, it makes no sense for a.2 to control an item specially designed to incorporate various components of concern but not to control an item which actually incorporates those components of concern.)

1 cooler having dewar specially designed for XII.a, b, or c
(c.9.iv)

1 specially designed electronics and optics therefor
(c.12)
Change “specially designed” to “application specific”

2 specially designed electronics, optics, and displays therefor
(c.13, c.16)
Change “specially designed” to “application specific”

25 subtotal, components described in XII.a-d.f

2. <u>Components described in component sub-category XII.e,f:</u>

1 specially designed optics and electronics therefor
(e.1)

Change “specially designed” to “application specific”

1 electron sensing devices specially designed for operation with a microchannel plate
(e.2.iv)
Change “specially designed” to “application specific”

2 phosphor screens or fiber-optic inverters specially designed for image intensifier tubes controlled in this category
(e.2.v, e.2.vii)
Technical description may be adequate to permit deletion of “specially designed.”

4 Read-Out Integrated Circuits (ROICs) specially designed for a c.2 IRFPA or for a camera/core/packaged IRFPA controlled by this subchapter
(e.4, Note to e.4, e.5, f Note 1)
Change “specially designed” to “application specific”

1 Sealed enclosure for a XII.c IRFPA or IIT specially designed for XII.a, b, or c
(e.6)
Technical description may be adequate to permit deletion of “specially designed.”

1 IRFPA dewar cooler <218 K, MTTF >3,000 hours, active cold fingers, variable or dual aperture, and dewars specially designed for XII.a, b, or c
(e.7.iv)
Technical description may be adequate to permit deletion of “specially designed.”

1 IRFPA Joule-Thomson self-regulating cryostats specially designed for articles controlled in this subchapter
(e.8)

Technical description may be adequate to permit deletion of “specially designed.”

3 Infrared lenses, mirrors, beam splitters or combiners, filters, and treatments and coatings; drive, control, signal or image processing electronics; and near-to-eye displays specially designed for articles controlled in this category
(e.9, e.10, e.12)

14 subtotal, components described in component sub-category XII.e

3. <u>End-items:</u>

1 Remote wind-sensing specially designed for ballistic-corrected aiming
(a.8)
Technical description may be adequate to permit deletion of “specially designed.”

1 LIDAR specially designed for obstacle avoidance or autonomous navigation in
Category VII ground vehicles.
(b.8.vi)
Technical description may be adequate to permit deletion of “specially designed.”

1 infrared imaging systems specially designed for military platforms in VI, VII, or VIII
(c.16.ix)
Change “specially designed” to “developed”
(The word “developed” is the only part of paragraph (a)(1) of the definition of “specially designed which can be applied to the word “military.”

1 near-to-eye displays specially designed for articles controlled in this subchapter
(c.18)

1 Systems incorporating IR beacon specially designed for Identification Friend or Foe
(c.20)
Technical description may be adequate to permit deletion of “specially designed.”

4 GNSS receiving equipment specially designed for military applications; encryption or decryption; use with a null steering antenna; or use with rockets, missiles, SLVs, drones, or UAVs
(d.6.i,ii,iii,iv)
Change “specially designed” to “developed” for military applications.
Technical descriptions may be adequate to permit deletion of “specially designed” for encryption, null steering antenna, and use with rockets or UAVs.

9 subtotal, end-items

The Boeing Company
929 Long Bridge Drive
MC 7949-5929
Arlington, VA 22202-4208

July 6, 2015

Mr. C. Edward Peartree, Director
Office of Defense Trade Controls Policy
Directorate of Defense Trade Controls
Department of State
SA–1, 12th Floor
Washington, DC 20522–0112.

Subject: RIN 1400-AD 32; Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

Reference: Federal Register/ Vol. 80, No. 86/ Tuesday, May 5, 2015/ Proposed Rules

Dear Mr. Peartree,

The Boeing Company ("Boeing") appreciates the opportunity to provide comments on controls proposed for Category XII of the United States Munitions List ("USML"). We strongly support the Export Control Reform effort and the Directorate of Defense Trade Controls ("DDTC") work to more precisely describe the articles warranting control on the USML. We have identified several issues where proposed International Traffic in Arms Regulations ("ITAR") controls could impact items in normal commercial use. Boeing does not manufacture these items so is not positioned to recommend alternative technical thresholds, but recommends that the stakeholder agencies use the technical advisory committees for assistance including an understanding of global and commercial availability.

Our comments address definitions, laser distance measuring devices, microbolometers, GPS receiving equipment, Global Navigation Satellite System receiving equipment, null steering antennas, and guidance and navigation systems used on commercial satellites.

1. <u>Definitions</u>

Controls related to certain proposed listings are not clear as some key technical terms are not defined in the control text. Page 25832 of the Federal Register Notice provides definitions to "explain and amplify terms used in this Category and are provided to assist exporters in understanding the scope of the proposed control." They include 'charge multiplication', 'focal plane array', 'image intensifier tube', 'microbolometer', and 'multispectral'. It is unclear whether these definitions will be incorporated into the ITAR.

Definitions for the terms 'rangefinder' and 'target' would also assist in compliant interpretation. We propose a definition for 'rangefinder' in our comment 3 below. The term 'target' has several definitions, including: *"something or someone fired at or marked for attack"*

(Merriam Webster online dictionary). However, it can also refer to an item or phenomenon that is the subject of study or concern. For example, a number of optical instruments in normal commercial use will use devices called 'targets'.

Recommendations:

- Include the definitions provided in the discussion section of the Proposed Rule either as standalone definitions in Part 120 of the ITAR or as notes in Category XII.
- Provide definitions for 'rangefinder' (see comment 3 below) and 'target' that distinguish the ITAR-controlled items from the commercial usage, or use qualifiers in the control text such as **military** target.

2. Fire control, weapons sights, aiming, and imaging systems and equipment, XII(a)(4) Note

The Note concerning LIDAR controls leaves out certain corresponding controls in paragraph (b).

Recommendation:

Revise the Note as follows: For controls on LIDAR, see paragraphs (b) ~~(9)~~ **(6-9)** of this category.

3. Laser Distance Measuring Devices, XII(b)(3)

The proposed regulatory text is:

(b)(3) Laser rangefinders having any of the following:
(i) Q-switched laser pulse; or
(ii) Laser output wavelength exceeding 1,000 nm;

No definition for 'rangefinder' is provided. The Merriam-Webster dictionary definition is:

1**:** an instrument used in gunnery to determine the distance of a target
2**:** a surveying instrument (as a transit) for determining quickly the distances, bearings, and elevations of distant objects
3**:** a usually built-in adjustable optical device for focusing a camera that automatically indicates the correct focus (as when two parts of a split image are brought together)

Without additional detail, this listing could capture commercial rangefinders using laser light. Boeing does not manufacture such devices, but Boeing and many other manufacturers use laser interferometers, laser radar scanners, and laser theodolites to measure distances in surveying and in factory settings. Applications include the measurement of commercial aircraft aerodynamic symmetry, alignment of production elements, verification of production tooling accuracy, design of one-off custom parts, etc.

Some of the devices in common commercial use exceed the wavelength threshold in the proposed listing. For example, the 3D laser scanner 'Surphaser Model 105HSX', marketed by a company in Redmond WA, has a laser output of 1550 nm. Product details are at http://www.surphaser.com/pdf/Surphaser%20105HSX.pdf. Given the important role of laser rangefinders in commercial production processes, narrowly scoped controls that do not capture items in commercial use are critical.

Recommendation:
Provide a qualification in the control listing or a definition for 'rangefinder' that differentiates military applications from commercial usage. For example: ***'rangefinder' in this category means an instrument used in gunnery to determine the distance of a military target.***

4. Microbolometers, XII (c)(2)

Many items currently controlled in the Export Administration Regulations under 6A002 would move to ITAR control due to the broad proposed control for unencapsulated focal plane arrays. A listing of particular concern is that for XII(c)(2).

The proposed regulatory text is:

> (c)(2) Photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm and not integrated into a permanent encapsulated sensor assembly, and detector elements therefor;

Boeing uses low-cost thermal imaging cameras for a host of applications in our factory environment including: temperature profiling, non-destructive inspection, and facilities checks to detect issues such as steam traps, electrical faults and failures, etc. To perform these tasks, we use cameras incorporating microbolometers operating in the 3,000-12,000 nm wavelength range. These cameras make use of focal plane arrays ("FPA") that are not encapsulated. Because the cameras contain FPAs described by (c)(2) and there are no element number thresholds in (c)(2) – as are found in (c)(12) - the cameras would have to be protected as ITAR items in accordance with the "see through rule". The cameras Boeing uses are currently classified as 6A003(b)(4), because they contain focal plane arrays controlled by 6A002(a)(3)(f). Such products are commercially available from companies such as the FLIR Corporation and are ubiquitous in industrial use. Control of such products on the USML is inconsistent with the objectives of export reform.

Recommendation:
Add a note to (c)(2) such that non-encapsulated FPAs incorporated into cameras are controlled in (c)(12), which has an element number threshold that will not capture these commercial items:

> ***Note to (c)(2): Non-encapsulated FPAs meeting the description contained in this listing and incorporated into cameras are subject to (c)(12) only.***

5. GPS Receiving Equipment, XII(d)(6)(iii) and Note

The proposed regulatory text is:

> (d)(6)(iii) GPS receiving equipment specially designed for use with a null steering antenna, an electronically steerable antenna, or including a null steering antenna designed to reduce or avoid jamming signals (MT if designed or modified for airborne applications);

GPS signal jamming equipment is widely available for purchase within the United States. These devices disrupt GPS systems such as cell phone and automotive systems within range of the jamming signal. Numerous models are available from sites such as: http://www.cellphone-jammers.org/GPS-Jammers-For-Sale.html

Although such jammers do not have great range, there have been instances of commercial aircraft systems being impacted at airports by signals from these jammers. With the proliferation of such devices, there will be increasing interference in the GPS signal band impacting both commercial and military aviation. The most practical solution is the application of null steering antennas to the commercial GPS receiving devices. Although null steering antennas and signal security systems for use on commercial aircraft are not yet commercially available, they are not inherently military. With continually increasing security threats to commercial airplane communications, those applications will soon arrive in the U.S. and elsewhere, as Boeing has explained in previous comments submitted on Category XI.

It appears some relief is offered by the (d)(6)(iii) exclusionary Note:

> *Note to paragraph (6)(iii):* The articles described in this paragraph are subject to the EAR when, prior to export, reexport, retransfer, or temporary import, they are integrated into and included as an integral part of an item subject to the EAR. Articles do not become subject to the EAR until integrated into the item subject to the EAR. Export, reexport, retransfer, or temporary import of, and technical data and defense services directly related to, defense articles intended to be integrated, remain subject to the ITAR.

However, freeing control of the GPS receiver designed for use with a null steering antenna does little to enable use of such devices in EAR controlled applications because the antennas they are used with are likely covered by Category XI:

> (c)(10) Antenna, and specially designed parts and components therefor, that:
> (i) Employ four or more elements, electronically steer angular beams, independently steer angular nulls, create angular nulls with a null depth greater than 20 dB, and achieve a beam switching speed faster than 50 milliseconds;
> (ii) Form adaptive null attenuation greater than 35 dB with convergence time less than one second;
> (iii) Detect signals across multiple RF bands with matched left hand and right hand spiral antenna elements for determination of signal polarization; or
> (iv) Determine signal angle of arrival less than two degrees (e.g., interferometer antenna);

The "see through rule" would apply to the antenna application such that that the end item containing the antenna would need to be protected as ITAR-controlled regardless of the exclusion for the receiver itself.

Recommendation:
Eliminate the (d)(6)(iii) control on GPS receiving equipment and retain control of the capability using the null steering antenna control in Category XI.

6. Dual Coverage of Null Steering Antennas, XII(d)(7)

The proposed regulatory text is:

> (d)(7) GNSS anti-jam systems employing adaptive antennas that have a minimum of four antenna elements, add 35 dB or greater anti-jam margin, and produce nulls in the direction of jammers or high-gain beams in the direction of satellites at any ranging code frequency;

The basis of this listing is the use of antennas that can direct the beam and the null to achieve 35dB or greater anti-jam margin. This technology is not specific to GNSS systems but rather with processing of signals received by the antenna. The XII(d)(7) listing thus creates dual coverage for items also captured by XI(c)(10) shown in comment 5 above. These systems are more logically placed in the general control of XI(c)(10).

Recommendation:
Delete (d) (7) and retain control over such antennas under Category XI.

7. Guidance, navigation, and control systems and equipment, XII(d)(1) and (3)

The (d)(1) and (d)(3) proposed listings, as currently written, capture space-qualified[1] guidance and navigation systems currently used on commercial satellites controlled under the EAR. For example, Miniature Inertial Measurement Units (MIMUs) are currently classified as 7A003.d.2 but are also captured by XII(d)(1) and (3). However, the MIMUs used in commercial satellites are designed and built with higher radiation hardening requirements and other elements commonly used on space qualified hardware. Furthermore, items captured by (d) are available outside the United States. For example, the space qualified Astrix 200 made by Airbus Defence and Space (see http://www.space-airbusds.com/en/equipment/astrix-200.html) already has better performance than several of the specified thresholds in (d)(3) such as true north determination (if products were used for north finding), Angle Random Walk, Bias Stability and Drift Stability.

Recommendation:

- Revise the threshold values in XII(d) to avoid capture of MIMUs as follows: Bias Stability: <0.0003 deg/hr (3-sigma); ARW <0.0002 (3-sigma); True North Determination calculated as (bias stability) / (15.04 deg/hr earth rate): <20 micro-radians (3-sigma); Drift stability in 1g environment (same thing as bias stability): <0.0003 deg/hr (3-sigma).

[1] Per the definition of space qualified provided in Note 3 to XV(e).

- Alternatively, add language to the Note for paragraph (d)(1) to exclude guidance, navigation and control systems used on commercial satellites. Add a new, similar note for (d)(3).

  Note to paragraph (d)(1): **This provision does not apply to items that are space qualified as defined in XV.** For aircraft and unmanned aerial vehicle guidance or navigation systems, see USML Category VIII(e). For rocket or missile flight control and guidance systems (including guidance sets), see USML Category IV(h).

  Note to paragraph (d) (3): **This provision does not apply to items that are space qualified.**

8. Note to paragraph XII(d)(1)

There seems to be an error in the Note to paragraph (d)(1) in this phrase: “For aircraft and unmanned aerial vehicle guidance or navigation systems, see USML Category VIII(e)”. This needs to be updated as USML Category VIII(e) is removed and reserved per the amendatory note 2 on p. 25825 of the Federal Register Notice.

Thank you for the opportunity to provide comments. Please do not hesitate to contact me if you have any questions or need additional information. I can be reached at 703-465-3505 or via email at christopher.e.haave@boeing.com.

Sincerely,

Christopher Haave

General Comment

GPS/GNSS adaptive antennas will provide benefits to counter the threats of intentional/unintentional interference and spoofing for civil aviation. While this is true from an anti-jam perspective to provide detection and possible localization capabilities in addition to the ability to maintain sustainable signal levels for receiver track, the ability to perform beamforming (in addition to nulling) supports current civil GPS requirements of code-carrier continuity of track, augments availability in addition to minimizing the impact of jammer and spoofer threat. Techniques such as linear constrained minimum variance beamforming may be used to achieve this goal. In fact, plain vanilla nulling could cause adverse impacts to tracking and the overall availability. Rockwell Collins requests the addition of the following notes to (d) (6) and (d) (7):

Note to paragraph (d)(6): This paragraph does not control GPS receiving equipment specially designed for use with a null steering antenna, an electronically steerable antenna, or including a null steering/beamforming antenna designed to reduce or avoid jamming signals for civil aviation applications.

Note to paragraph (d)(7): This paragraph does not control GNSS anti-jam/beamforming systems for civil aviation applications.

Subject: ITAR Amendment – Category XII/RIN 1400-AD32
Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII, Specifically Category XII(c)(16)(i)

Dear Mr. Peartree:

Introduction

Bristow Group Inc. ("Bristow") appreciates the opportunity to comment on the proposed revisions to Category XII of the United States Munitions List ("USML"), Part 121 of the International Traffic in Arms Regulations ("ITAR"). 80 Fed. Reg. 25821 (hereafter "Proposed USML Category XII"). Bristow appreciates the Directorate of Defense Trade Controls' ("DDTC") engagement with the industry as part of the Export Control Reform Initiative.

While Bristow welcomes a positive-list approach to the Proposed Category XII, we believe that the revisions will continue to capture items which are now in normal commercial use. As an operator of civilian aircraft for search and rescue ("SAR") operations, Bristow uses electro-optical/infrared ("EO/IR") systems, which include forward-looking infrared sensors, installed on aircraft in the normal course of business provided to our customers. As set forth in more detail below, Bristow believes that those EO/IR items described in amended Category XII(c)(16)(i) should be moved from ITAR to the Commerce Control List ("CCL") of the Export Administration Regulations ("EAR").

Bristow and SAR Operations

Bristow Group

As the first civilian helicopter transport company to work in the oil and gas industry, Bristow has provided transportation, production management and related services for 60 years. The company offers point-to-point scheduled and charter transportation services, combining fixed-wing with rotary-wing services to clients around the world. In addition to providing helicopter transport services for energy companies and others, Bristow is a leader in SAR services.

Bristow

Bristow's fleet of consolidated and unconsolidated helicopters includes almost 500 civilian helicopters (including light, medium and heavy aircraft).

SAR Operations

Bristow operates private sector SAR services in Australia, Canada, Norway, Russia, Tanzania and Trinidad, and public sector SAR services for the entire land and adjacent waters of the United Kingdom on behalf of the Maritime and Coastguard Agency ("MCA") of the U.K. Department for Transport ("DfT").

UK SAR Program

In 2012, Bristow Helicopters Ltd. ("Bristow UK," a U.K. affiliate of Bristow) was awarded a contract, known as the "GAP SAR U.K. Contract" to provide civilian search and rescue helicopters services from two bases in the United Kingdom on behalf of the U.K. DfT and its MCA. In 2013, the contract was extended to 10 U.K. bases. Under the full U.K. SAR contract, Bristow UK will operate 22 aircraft from 10 bases across the United Kingdom, strategically located near areas of high SAR incident rates. The contract runs until 2026.

Bristow UK's services for the DfT/MCA are purely civilian in nature. The MCA is an executive agency of the U.K. DfT, and it has no military or law enforcement function.[1] Bristow UK has a long history of providing SAR services in the United Kingdom, dating back to 1971. In total, Bristow UK has flown more than 44,000 SAR operational hours in the United Kingdom and conducted over 15,000 SAR missions, during which more than 7,000 people have been rescued by the company's crews and helicopters.

Bristow has led the industry in introducing new aircraft types and technology to the civil market. The SAR equipment it has developed has become the industry standard, resulting in Bristow UK being recognized with the Queen's Award for Innovation for its technical developments.

Private SAR

In response to recent incidents in safety, oil and gas industry leaders have increased their efforts to be equipped for accidents by securing SAR coverage for their operations. Given Bristow's existing relationships with these oil and gas industry leaders and Bristow's depth of experience in SAR, we have been awarded contracts for private SAR services. For these oil and gas industry clients, Bristow supplies a dedicated SAR helicopter and crew to cover exploration projects in remote areas. It requires specific expertise to conduct SAR operations, and Bristow has been a world leader in SAR for years, with experienced pilots, aircrew, paramedics, engineers and ground crew to conduct SAR operations safely and reliably.

---

[1] The definition of "armed forces" under Section 130.3 refers to "the army, navy, marine, air force, or coast guard as well as the national guard and national police, of a foreign country." Bristow believes that the reference to "coast guard" in Section 130.3 refers to an organization that performs in part military and law enforcement functions similar to the other military services. For example, the U.S. Coast Guard, which is presently under the Department of Homeland Security, states on its website that it is one of the nation's "five military services", and that it is a "military, multi-mission, maritime force offering a unique blend of military, law enforcement, humanitarian, regulatory, and diplomatic capabilities." Its missions include "port and waterway security", "defense readiness", drug interdiction", and "law enforcement". Based on that review, Bristow's U.K. affiliate's search and rescue services for the U.K. DfT and MCA are not "for the use of the armed forces of a foreign country."

SAR-Equipped Helicopters

In order to meet the demands of its customers, Bristow uses a variety of SAR-equipped helicopters, including the Sikorsky S-76, Sikorsky S-92[2], AgustaWestland 139, AgustaWestland 189, and H225 aircraft, all of which, in their standard configuration, are civilian aircraft.

The industry standard minimum requirement for a SAR helicopter is the hoist, which is capable of lifting the rescuer and victim at the same time. The aircraft is also equipped with a flight management system, which flies the aircraft over a pre-programmed search grid at sea. Additional basic SAR equipment includes emergency flotation devices on the skid landing gear, weather radar, and a PA system. However, these minimum equipment requirements are only effective for daytime SAR missions.

To perform nighttime and all weather SAR missions, the SAR helicopter must be equipped with equipment to assist in less-than-ideal flying conditions, such as low visibility, nighttime, and inclement weather. The main requirement for these SAR helicopters—in addition to the equipment mentioned above— is a de-icing system, specific navigation and search equipment, and extra medical equipment for taking care of survivors. Specifically, to perform nighttime SAR missions, the helicopter must be equipped with a forward looking infrared camera which can be incorporated into an EO/IR system, powerful external lighting, a searchlight, and a cockpit that is compatible with the use of night vision goggles.

To perform SAR operations 24 hours a day/7 days a week in any weather and on any terrain, helicopters must be equipped with an EO/IR system incorporating forward looking infrared sensors and thermal imaging camera technology.[3] See Attachment B which details technology used on Bristow SAR helicopters.

Bristow SAR helicopters[4] are currently equipped with an EO/IR system. Additionally, future purchases of SAR helicopters will require the installation of an EO/IR system on the helicopters.

EO/IR Systems

Bristow Use of EO/IR Systems

Bristow's use of EO/IR systems has been solely for commercial purposes, i.e. to provide civilian SAR services to customers. In fact, in the course of Bristow's review of EO/IR system manufacturers, it was apparent that EO/IR systems are used on many civilian SAR operations around the world, including aircraft and sea vessels. Some of the SAR operations using EO/IR systems include the Royal Canadian Mounted Police[5], Norwegian Society for Sea Rescue[6],

---

[2] See Attachment A for a diagram of a SAR-equipped S92 for use in Bristow's contract with the U.K. MCA.
[3] Bristow's SAR operations also include the use of night-vision goggles (NVGs) by pilots and crew. While NVGs are currently on the USML and the proposed revisions to Category XII, Bristow does not intend to comment on the classification of NVGs.
[4] Bristow also operates "Limited SAR" ("LIMSAR") helicopters. LIMSAR helicopters are not equipped with an EO/IR system. LIMSAR helicopters are also considered part of Bristow's SAR operations.
[5] http://www.airbushelicopters.com/w1/jrotor/71/rcmp.html
[6] http://www.flir.eu/marine/display/?id=42090

Irish Coast Guard (operated by CHC Helicopters)[7], Japan Coast Guard[8], Norway Ministry of Justice and Public Safety[9], and China's Ministry of Communications - Shanghai Salvage & Rescue Bureau[10].

Bristow's SAR services, both private and public, cover a variety of terrain and conditions. For many private SAR customers, Bristow SAR helicopters must be equipped to perform SAR operations over large stretches of water to reach oil and gas platforms and alternative landing sites. Additionally, over half the coverage area for the SAR services provided to the U.K. MCA is over water.[11] The EO/IR system allows the crew, and particularly the winch men, to pan over the water to look for distressed persons. Due to the difference in temperature between a human and the water, the infrared sensing capabilities of the forward-looking infrared sensors allow the crew to locate persons in the water from the aircraft, particularly where rough seas are encountered.

Similarly, for SAR operations over land, the benefits of the EO/IR system cannot be overstated. On rock, mountainous terrain, when it is difficult to maintain visibility on the distressed persons, the EO/IR system allows the crew to easily detect the person(s) on the ground. Once detected, instruments on the EO/IR system permit the crew to automatically maintain focus on the person(s), while the crew is able to prepare the winch.

An EO/IR system's performance heavily depends on stabilization and the image resolution, both of which are crucial to SAR operations. The stabilization capability of the EO/IR system counteracts the intense vibrations and motion of the aircraft to provide a clear image in the system viewer. Crews on the SAR helicopters require a high level of stability to locate distressed persons from far distances and in inclement weather conditions. To perform the rescue, the crew must track the distressed person as the aircraft positions for the rescue operation. Without a high level of stability, the tracking requires more time, when time is of the essence.

The measure of resolution refers to the number of pixels on an imaging component of the EO/IR system. An increase in the pixels improves the image quality and equips the crew with a clearer view of the scene. With the visual information from the image, the crew can quickly strategize on the most effective rescue operation.

Time is of critical importance in SAR operations particularly where the helicopters are required to operate to their maximum range which limits time available in the rescue area due to fuel constraints. Mere seconds can make the difference between life and death. Bristow's crews use the EO/IR systems to quickly search for distressed persons and track them in preparation for a rescue mission. Countless lives have been saved with the use of this technology. Due to confidentiality agreements with its customers, Bristow is unable to share details of SAR missions performed. Suffice to say, the EO/IR systems have been a vital to the success of our SAR operations in saving lives.

EO/IR System Purchases

Since at least 2002, Bristow has purchased and operated U.S. and foreign manufactured EO/IR systems on SAR helicopters. Based on the manufacturer's assessment, EO/IR systems are captured on the current version of USML Category XII(c). For this reason, Bristow has taken the necessary measures to ensure compliance with DDTC licensing and compliance requirements.

Depending on the destination of the aircraft, the origin of the EO/IR system, and the aircraft manufacturer, Bristow will require the EO/IR system to be exported and outfitted to the aircraft in several different ways. When using a foreign aircraft manufacturer, Bristow purchases the EO/IR system directly from the system manufacturer. The EO/IR system manufacturer exports the system to the location in which it will be fitted to the aircraft and/or the end-use destination of the SAR aircraft. In those cases, the EO/IR system manufacturer obtains the export license. In those cases, the EO/IR system manufacturer may be a foreign manufacturer or U.S. manufacturer.

Alternatively, when working with U.S. aircraft manufacturers, the EO/IR system is shipped to the aircraft manufacturer and fitted to the aircraft in the U.S. Once the aircraft is equipped with the EO/IR system and delivery is made available to Bristow, Bristow is responsible for obtaining the export license for the aircraft, which includes the EO/IR system.

Bristow currently owns or operates the following EO/IR systems on its SAR aircraft:

- FLIR Systems, Inc. Star Safire III (U.S. manufacturer)
- FLIR Systems, Inc. Ultra 4000 (U.S. manufacturer)
- Wescam MX-15HDi Surveillance System (Canadian manufacturer)

Comments

In response to the request in paragraph (4) of the "Request for Comments" portion of the preamble to the Proposed USML Category XII, Bristow submits these comments to "provide specific examples of items…that would be controlled by the revised USML Category XII…that are now in normal commercial use."

As outlined above in our description of services, Bristow uses EO/IR systems and technology commercially to provide civilian SAR services to our customers around the world. We believe the EO/IR systems used by Bristow, currently captured by USML Category XII(c), would be included under the Proposed Category XII, specifically XII(c)(16)(i). For those items, which Bristow has identified as currently in commercial use, we strongly recommend that such items be transferred to the CCL of the EAR.

Administrative Burden

Due to the nature of Bristow's business, sharing technical data related to the EO/IR system is required. For this reason, Bristow must prepare Technical Assistance Agreements ("TAA") for the release of technical data associated with EO/IR systems. The process for securing approval on a TAA from DDTC includes drafting the TAA, review by all parties to the TAA, submission to the DDTC, and, if the TAA is approved, obtaining signatures by all the parties to the TAA before export pursuant to the TAA can be undertaken. Additionally, Bristow must obtain nationality information and perform screening on all employees who may be given access to the technical data. Protective measures must be put in place to ensure no unauthorized access to the technical data. Compliance plans and training must be performed as part of the protective measures. Once the TAA is executed, the actual export licenses (DSP-5 or DSP-73) must then be applied for.

To apply for and obtain the necessary export licenses (whether temporary or permanent) usually takes several weeks to months, depending on the complexity of the purchase. Furthermore, because of the value associated with the purchase of several aircraft, Congressional Notification may be required for permanent exports of the civilian aircraft with the EO/IR equipment installed. While Bristow has thus far been successful in obtaining the necessary export licenses, there have been instances in which the approval has come uncomfortably close to Bristow's contractual deadlines for delivery of the helicopters.

Moreover, due to the nature of the helicopter services industry, the lead time on a commercial opportunity may only be presented several weeks in advance. Bristow is unable to offer its services without certainty that it will be able to obtain the necessary DDTC approval in time for the performance of services. These delays can put Bristow at a strategic disadvantage relative to its foreign competitors.

Moving the EO/IR systems used for SAR operations to the CCL would allow Bristow to more quickly react to industry demand and compete on an equal footing with foreign providers of SAR services. While DDTC has indicated that the average processing time for a license is between 25-29 days since January 2015[12], Bristow has experienced a wider variation in processing times, including over 40 days for a license application to be processed, in addition to the lengthy process of having a TAA reviewed, approved, and executed. According to BIS's Annual Report to the Congress for Fiscal Year 2014, BIS processes licenses in an average of 23 days.[13] Exports of technical data under the CCL would not require an executed TAA prior to application for a license to export thus eliminating the additional time required for TAA execution. Additionally, the CCL offers license exceptions that would potentially be available for Bristow's exports, making the export process more efficient by eliminating the requirement to obtain a license.

System Complexity

Due to the complexity of the EO/IR system and its components, exporting an EO/IR system independent from the aircraft to which it will be equipped is difficult. All aircraft currently used by Bristow for SAR operations are civilian aircraft, listed on the CCL. However, certain models of SAR helicopters must be equipped with an EO/IR system by the aircraft manufacturer. Internal wiring for the EO/IR system is not simple add-on equipment but must be embedded into the aircraft during the manufacturing process. Once the aircraft is equipped with the entire EO/IR system, i.e. external attachments and monitors, the aircraft is then classified under USML Category VIII(a)(11).[14] For this reason, Bristow is required to export the entire aircraft pursuant

[12] http://pmddtc.state.gov/metrics/index.html
[13] Bureau of Industry and Security - Annual Report to the Congress for Fiscal Year 2014, pg. 7.
[14] EO/IR systems are identified as a "mission system" defined in USML Category VIII, Note 1 to paragraph (a)(11), as " 'systems' that are defense articles that perform specific military function such as by providing military communication, electronic warfare, target designation, surveillance, target detection, or sensor capabilities."

to a license obtained from the DDTC, as opposed to obtaining a license only for the EO/IR system.

Removing the EO/IR system, including its parts and components, from the USML would eliminate the requirement that the entire aircraft be included on the USML. This would significantly reduce the burden of moving aircraft globally.

Foreign Availability

EO/IR systems are available by foreign manufacturers. Below is a table of available EO/IR systems in the marketplace:

PRODUCT NAME	COMPANY	COUNTRY OF MANUFACTURE
Star SAFIRE 380-HD[15]	FLIR Systems, Inc.	USA
MX-15[16]	L-3 Wescam	Canada
Toplite EOS[17]	Rafael	Israel
Agile 2[18]	Thales Optronique	France
Euroflir 350[19]	Sagem	France
MOSP-3000HD[20]	Israel Aerospace Industries	Israel
DCoMPASS[21]	Elbit Systems	Isreal
EOST-46[22]	Selex ES	Italy

For some SAR helicopters, Bristow has used foreign manufactured EO/IR systems on foreign manufactured aircraft. For example, the Wescam MX-15 is used on Bristow's H225s. The MX-15 was exported from Canada pursuant to a Canadian export license obtained by the system manufacturer. The use of a foreign manufactured EO/IR system has simplified the global movement of the aircraft and presented opportunities which would not have been available for an aircraft embedded with a U.S.-manufactured EO/IR system since the aircraft in its entirety is not controlled, but simply the EO/IR system. While the ease of movement was not the sole reason for Bristow's choice of a foreign EO/IR system manufacturer, the benefit of a non-U.S. manufactured EO/IR system is apparent.

Bristow believes that U.S. EO/IR system manufacturers would be in a better position to present information on foreign competition and any differences that exist among the products in the industry. As an operator of EO/IR systems, Bristow can attest to the fact that there are foreign manufactured systems that offer the same capabilities as those manufactured in the United States.

Because these EO/IR systems are readily available from foreign manufacturers these systems do not appear to provide a critical military or intelligence advantage to the United States, and thus, we believe the item should not meet the criteria for continued control under ITAR. EO/IR

systems described at Category XII(c)(16)(i) that are manufactured in the United States should be moved to the CCL. It is also worth noting that the Wassenaar Arrangement Munitions List (Category 15), does not appear to specifically list an EO/IR system like those described in USML Category XII(c)(16)(i).

Technical Specifications and Parameters

As outlined above, EO/IR systems with stabilization and high resolution imaging capabilities are required to provide adequate civilian SAR services. While they may provide some military function, their normal commercial use and their foreign availability indicate that they do not provide a critical military advantage sufficient to be included on the USML. Instead, higher resolution and stabilization, allow Bristow and other SAR providers to perform better and save more lives. Additionally, safety of the crew is improved with the ability to operate safely in low light and visibility. The resolution and/or stabilization should not be the criteria used to determine whether an EO/IR system is captured on the USML. These criteria are essential to successful SAR missions.

As a purchaser of EO/IR systems for normal commercial use, Bristow is not in a position to comment on what specifications and parameters of EO/IR systems provide a sufficient military advantage to warrant being placed on the USML rather than the CCL. However, Bristow is aware of certain optional functions that are available on EO/IR systems which Bristow has declined to obtain. Bristow believes that some of these functions provide examples of functions that may materially enhance military capability and are less likely to be used in commercial applications. For example, EO/IR systems can be programmed to provide laser-guided munition capabilities and counter-measures. These functions are of no use to civilian SAR operations and would serve as differentiating characteristics of those EO/IR systems that should be captured by the USML.

While Bristow is aware of optional capabilities of EO/IR systems, described above, we are not EO/IR system manufacturers and thus are not completely educated in all the characteristics, specifications and capabilities of all EO/IR systems. While we are able to comment on the civilian use of higher resolution and stabilization for SAR operations, Bristow does not have full knowledge of all other specifications. For this reason, we believe the EO/IR system manufacturers would be in the best position to further comment on what additional parameters would be optimal for differentiating between EO/IR systems that should be on the USML.

EAR Jurisdiction

Bristow recommends that EO/IR systems of the type used for civilian SAR operations which are covered by proposed USML Category XII(c)(16)(i) be moved to the CCL, specifically ECCN 6A003.

Conclusion

Bristow obtains and operates EO/IR systems for normal commercial use. Proposed USML Category XII controls these same EO/IR systems. Bristow believes that EO/IR systems used in civilian SAR operations should be removed from the USML and instead controlled on the CCL for the following reasons:

- Bristow, along with other helicopter operators, use EO/IR systems described under amended Category XII(c)(16)(i) in the normal course of commercial business.
- The EO/IR systems used by Bristow are invaluable to the success of SAR operations and saving lives.
- EO/IR systems used by Bristow are available from foreign manufacturers.
- The complexity and time-consuming nature of ITAR-controlled licensing procedures (including Congressional Notification requirements) hinder Bristow's commercial opportunities.

Thank you again for affording us the opportunity to provide comments. Please do not hesitate to contact me if you have any questions or need additional information. I can be reached at 713-430-7721 or via email at Miriam.eqab@bristowgroup.com.

Sincerely,

Miriam Eqab
International Trade Compliance Counsel

Technology

Bristow Helicopters has led the industry in introducing new aircraft types and technology to the civil market and the search and rescue equipment developed by the company has become industry standard, resulting in Bristow Helicopters being recognised with the prestigious Queens Award for Innovation for the company's technical developments.

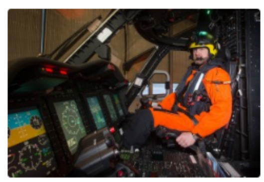
Our new search and rescue helicopters are fitted with a raft of state of the art technology, some of which has never before been used in commercial search and rescue aircraft.

Night Vision Goggles

Bristow Helicopters has gone to great lengths to obtain the necessary International Traffic in Arms Regulations (ITAR) export licence in order to invest in the best possible night vision goggle (NVG) technology available to the civil market for its SAR crews. In terms of civilian operations, Bristow's S-92 SAR aircraft are the first type in Europe to be certified for NVG and have the first "glass cockpit" to be certified NVG compatible. The technology is essential when responding to night time incidents, particularly during the short winter days when operations can extend into the hours of darkness.

Forward-looking infrared (FLIR)

Our SAR aircraft have improved forward-looking infrared (FLIR) and thermal imaging camera technology for more effective searches and high illumination lighting to make winching easier and safer. This is particularly useful when operating in confined spaces or conducting cliff rescues. The long range fuel tanks allow us to operate across the vast distances we are covering.



Wireless communication

The UK SAR S-92s are the first aircraft in Europe to be fitted with Trulink® wireless capabilities for communications between the aircraft and crew, while the wireless intercom system allows winchmen to not only communicate with the aircraft but also to communicate with nearby vessels in the event that they are left behind at the scene. A much improved external public address system allows the SAR crew to communicate more effectively with casualties on the ground below.

Medical capabilities

The medical zone intercom allows the cabin and cockpit to be split into isolated zones, meaning medical teams can work on a patient without the flight crew being distracted. Improved cabin lighting, including emergency white light, will enable advanced medical procedures to be carried out onboard. In addition, the cabins are fitted with 230 volt ac power outlets so that the SAR aircraft can operate advanced medical equipment onboard. Bristow has designed a bespoke cabin layout to accommodate more casualties and medical equipment safely.

C. Edward Peartree, Director

Office of Defense Trade Controls Policy

U.S. Department of State

ATTN: Regulatory Change, USML Category XII

2201 C Street, NW

Washington, DC 20520

Re: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII; Comments on Category XII Paragraphs (c)(9)(i) and (e)(7)(i)

Dear Mr. Peartree:

Chart Inc. (Chart) has recently become aware of the State Department's proposed rule to amend the International Traffic in Arms Regulations (ITAR) to revise Category XII (fire control, range finder, optical and guidance and control equipment) of the U.S. Munitions List (USML) (RIN: 1400-AD32) (the Proposed Rule). This comment addresses specifically the proposed amendments to title 22, chapter I, subchapter M, part 121.1, USML Category XII (c)(9)(i) and USML Category XII (e)(7)(i) (together, the Proposed Addition).

1. Summary of the Issue

The Proposed Addition lacks control criteria that specifically describe items with the potential for use in strategic defense or space applications. On the contrary, the criteria included in the Proposed Addition are common to virtually every modern cryogenic cooler, whether commercial grade or tactical munitions-grade. Commercial-grade cryocoolers do not provide the United States with any military or intelligence advantage and therefore should not be controlled as defense articles. The incorporation of Chart's proposed criteria (discussed throughout and listed in Section 3C) will provide a clear, bright-line, distinction between items in normal commercial use and items properly considered defense articles for control on the USML.

If adopted in its present form, the impact of the Proposed Rule will be substantial, resulting in the imposition of significant costs of compliance. The Proposed Rule will impact manufacturers' costs of production, and cause a consequent loss of exports and jobs. Chart, through its predecessor in interest, Clever Fellows Innovation Consortium, Inc., has been producing and selling commercial-grade cryocoolers for over twenty years. Because Chart and others in the industry have been selling commercial cryocoolers to domestic and foreign end-users for many decades, Chart does not believe that the increased regulatory burden it and others stand to incur will result in a corresponding benefit to United States national security or contribute to the achievement of any military or intelligence advantage.

2. Relevant Text

Following is a citation of the Proposed Additions to USML Category XII paragraphs (c) and (e) with relevant language bolded:

> (c) Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:
>
> …
>
> (9) Integrated IRFPA dewar cooler assemblies (IDCAs), with or without an IRFPA, having any of the following:
>
> (i) **Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours**;
>
> (ii) Active cold fingers;
>
> (iii) Variable or dual aperture mechanisms; or
>
> (iv) Dewars specially designed for articles controlled in paragraphs (a), (b), or (c) of this category;

(e) Parts, components, accessories, attachments, and associated equipment as follows:

…

(7) Integrated IRFPA dewar cooler assembly (IDCA) parts and components, as follows:

(i) **Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours**;

(ii) Active cold fingers;

(iii) Variable or dual aperture mechanisms; or

(iv) Dewars specially designed for articles controlled in paragraphs (a), (b) or (c) of this category;

3. Details of the Issue

A. The U.S. government does not want to inadvertently control items on the USML that are in normal commercial use. The public is requested to provide specific examples of items that would be controlled by the Proposed Rule that are now in normal commercial use.

Chart's cryocoolers serve a wide range of applications and have been sold for use in both domestic and foreign locations. Primary consumer end-uses for our cryocoolers include the long-term cold storage of medical and biological samples (e.g., tissues from cancer studies); freeze-point testing of commercial fuels for cold-temperature use; on-site liquefaction of medical oxygen for therapeutic use (e.g., for ambulatory patients with lung disease); education, fundamental physics and cryogenics research; and conversion of cryogenic storage tanks to zero-loss by re-condensation of boil-off vapors. The above-mentioned end-uses for our cryocoolers are real; these are not hypothetical. With the exception of the use of a cryocooler for the conversion of a cryogenic storage tank to zero-loss, which is currently still in development, Chart has sold units for each of the above mentioned end-uses to end-users located in the United States, Japan, China, Russia, Brazil, Israel, and the Czech Republic, among other places.

B. A key goal of the rulemaking is to establish a "bright line" between the USML and the CCL for the control of materials. The public is asked to provide specific examples of control criteria that do not clearly describe items that would be defense articles and thus do not establish a "bright line" between the USML and the CCL.

The Proposed Addition related to cryocoolers in paragraphs (c) and (e) is: "**Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours.**" Commercial cryocoolers, like the type produced by Chart, are not flight-weight, tactical cryocoolers suitable for use in thermal imaging, munitions, or space applications. Yet, each of Chart's cryocoolers, from the smallest to the largest model we offer, meets the criteria of (i) having a cooling source temperature below 218 K, and (ii) a mean-time-to-failure (MTTF) in excess of 3,000 hours. Far from creating a bright line test to distinguish coolers capable of use as defense articles from those designed to meet commercial needs, the Proposed Addition describes two criteria almost every commercial-grade cryocooler meets. Indeed, every cryocooler Chart has sold in the last 20-plus years, for the above-mentioned consumer end-uses, meets the temperature and MTTF criteria set out in the Proposed Addition.

Cryogenic temperatures are critical to enable infrared, gamma-ray and x-ray detectors, and reliable, multi-year cooling is essential for defense, satellite, and space applications. The cryocoolers suited to achieve the intended control objectives of the Proposed Rule are those cryocoolers specially designed to meet the United States' specific military and intelligence needs. This class of coolers can be succinctly described as "SADA-qualified" cryocoolers. The Standard Advanced Dewar Assembly module (SADA), was created by the Department of Defense (DOD) in an effort to standardize second-generation thermal imaging systems and their attendant critical components. The established family of SADAs each comprise an infrared focal plane array (IRFPA), dewar, command and control electronics, and a cryogenic cooler, and each family is designed to address high performance (SADA I), mid-to-high performance (SADA II), and compact class systems (SADA III). The family of cryogenic coolers that support the SADAs are generally Stirling-cycle coolers, and by their very definition these SADA-qualified coolers are suited to meet the DOD's varying standards of low input power, vibration cancellation, low noise, and high reliability.

The criteria included in the Proposed Addition do not appropriately distinguish commercial cryocoolers and those that meet DOD SADA requirements, or even more generally between coolers that reasonably can and cannot be operated to support the infrared (IR) and other focal plane array (FPA) sensors and imaging equipment that are the proper focus of the relevant USML Category XII paragraphs. On the contrary, the Proposed Addition captures cryocoolers that because of inherent limitations in weight, size, input power, and cooling capacity, are not considered by the industry as capable of use in any tactical military, or space application.

Chart's commercial-grade cryocoolers and the family of SADA tactical cryocoolers are similar to the extent that they may be characterized as Stirling-cycle devices, inasmuch as both devices use valveless compressors, or pressure oscillators, to cause cyclic temperature variation in a closed vessel of gas. Ultimately there are more differences than there are similarities, however. One primary difference between Chart's commercial-grade coolers and tactical or munitions-grade coolers, is the fact that SADA cryocoolers are generally displacer-equipped. Meaning, a mechanical displacer within the device is used to separate the heating and cooling effects in relation to the pressure oscillation. Chart cryocoolers – indeed, any "pulse tube" or "acoustic-Stirling" cryocoolers – on the other hand, do not have such displacers. Acoustic-Stirling cryocoolers move hot and cold gas out of phase with the internal pressure through use of a reservoir that stores and returns gas during the operating cycle, by means of the inertial behavior of the gas only. This distinction is notable because acoustic-Stirling devices, like Chart's, require a cold finger configuration that is almost always unacceptable for use in a cryocooler for military or tactical end-use applications. More specifically, because of the presence of the buffer, or "pulse" tube, a larger diameter cold finger and a secondary reservoir tank are required to produce the same refrigeration power as a comparable Stirling-cycle device. These differences simplify construction for cost savings in commercial use, but do not support military functionality. Notably, the larger SADA II-qualified cryocooler must provide a 1-2 Watt capacity at 77K, with a coldfinger that fits within the standard SADA dewar bore of a 0.5-inch diameter. Chart's smallest commercial model, on the other hand (the QDrive® 2s102K cooler), is rated at 6-8 Watts at the same temperature and its coldfinger has a diameter three times that size, at 1.25 inches. For more information about the challenges in conforming acoustic-Stirling (sometimes also called "pulse tube" type) cryocoolers to SADA requirements see, *Pulse Tube Cryocoolers for Cooling Infrared Sensors*, by R. Radebaugh, National Institute of Standards and Technology, attached here as Exhibit A.

Another material distinction, or "bright line", between tactical and commercial-grade coolers is the units' allowable weight. Again, all of Chart's commercial-grade cryocoolers regularly achieve temperatures below 218 K and all have an MTTF in excess of 3,000 hours. Yet, the smallest model we offer, the 2s102K cooler, weighs between 22-26 lbs., depending on the options chosen. Even at the lowest possible end of the spectrum – 22 lbs. – our 2s102K model cooler weighs 14.5 lbs. more that the cryocooler required to meet SADA I requirements, and it is 17.8 lbs. in excess of the cryocooler required to meet SADA II requirements. Weight alone is sufficient to preclude use of commercial-grade cryocoolers in strategic military, or tactical space applications. For more information about the key parameters for SADA family cryocoolers see, *Status of Programs for the DoD Family of Linear Drive Cryogenic Coolers for Weapon Systems*, by W.E. Salazar, attached here as Exhibit B.

Input power is another criterion that could be used to distinguish tactical from commercial-grade coolers. SADA family cryocoolers operate from battery-bus DC voltage, but most commercial-grade cryocoolers connect directly to utility AC power. By way of example, an army qualified SADA II cryocooler will draw 60 Watts through a controller from a battery; whereas, the smallest commercial cryocooler in Chart's offering draws up to 320 Watts from 110 Volts/60 Hz AC power. The maximum allowable input power for any cryocooler in the SADA family is 94 Watts, for a SADA I-qualified cooler, which is far exceeded by most of the smallest commercial-grade models.

C. For any criteria that the public believes will control items in normal commercial use, the public is asked to identify parameters or characteristics that cover items exclusively or primarily in military use.

Because the SADAs capture the distinct technical requirements necessary for cryocoolers for use in tactical military and space applications, Chart suggests that some criteria from the SADAs be incorporated into the Proposed Additions to create the intended "bright line" between defense articles, appropriately controlled on the USML, and items otherwise subject to the EAR. As discussed in more detail above, listed below are the practical criteria that if incorporated into the Proposed Addition would provide a distinction between commercial and munitions-grade, tactical cryocoolers. Chart suggests that the Proposed Additions be deleted and that USML Category XII, paragraphs (c)(9)(i) and (e)(7)(i) be amended to include any combination of these criterion:

i. Stirling-cycle, displacer-equipped cryocoolers
ii. Maximum cooling capacity of 5 Watts at 77K when rejecting to 20C or lower ambient temperature.
iii. Cryocoolers having a coldfinger less than 25 mm in diameter
iv. Cryocoolers weighing less than 10 lbs per unit
v. Cryocoolers with a stated maximum power input of not more than 100 Watts

CHART®

vi. Cryocoolers operable from DC electrical input, or a maximum AC voltage not to exceed 50 Volts rms

Chart believes that these criteria are clear and describe appropriate bounds around the characteristics of, and thus limit ITAR controls to tactical, military-grade cryocoolers.

The addition of any combination of the criteria described above will bring the text of USML Category XII closer to established precedent regarding the control of defense articles. Chart believes the deletion of the current criteria and addition of any of those mentioned above will be sufficient to avoid future confusion and will further the Department's goal of creating a bright line between items on the USML and the CCL. Please contact me with any questions. Chart is happy to discuss this further and provide all reasonable assistance in order to achieve approval of our requested amendment.

Sincerely,

John Corey

Pulse Tube Cryocoolers for Cooling Infrared Sensors*

Ray Radebaugh

National Institute of Standards and Technology
Boulder, Colorado 80303 USA

ABSTRACT

This paper reviews recent advances in pulse tube cryocoolers and their application for cooling infrared sensors. There are many advantages of pulse tube cryocoolers over Stirling cryocoolers associated with the absence of moving parts in the cold head. Efficiencies have been improved considerably in the last few years to where they equal or even exceed the efficiencies of Stirling cryocoolers. The use of inertance effects and double inlets to improve the efficiencies will be discussed. Pulse tube cryocoolers are now being used or considered for use in cooling infrared detectors for many space applications. One disadvantage of pulse tube coolers is the difficulty in scaling them down to sizes as small as 0.15 W at 80 K while maintaining high efficiency. A second disadvantage is the larger diameter cold finger required for the same refrigeration power because of the presence of the pulse tube. These two disadvantages have limited their use so far in cooling infrared sensors for many military tactical applications. Progress in overcoming these disadvantages is discussed.

Keywords: Cryocoolers, Cryogenics, Detectors, Infrared, Night vision, Pulse tubes, Refrigerators, Review, Sensors, Stirling

1. INTRODUCTION

Small cryogenic refrigerators (cryocoolers) are required for a wide variety of applications, and the number of applications keeps expanding as improvements to cryocoolers are made. One of the earliest applications, and one that appeared about 50 years ago, was for cooling infrared sensors to about 80 K for night vision capability of the military. Over 125,000 Stirling cryocoolers for this tactical military application have been produced to date.[1] Refrigeration powers vary from about 0.15 W to 1.75 W. In the last decade or so the desire for night vision surveillance and missile detection from satellites has prompted much research on improved cryocoolers to meet the very stringent requirements for space use. Each application has a particular set of requirements that have led to many recent improvements in cryocoolers. Still, some of the problems associated with cryocoolers have hampered the marketing of many potential applications. The major problems associated with cryocoolers are listed in Table 1. For satellite applications all but the last problem in Table 1 are of major concern, even though a space-qualified cryocooler can cost $1.0M or more. Lifetimes of 10 years are now standard requirements for most space applications. Until recently efficiencies of 3 to 10% of Carnot were typical of these small cryocoolers, whereas now efficiencies of 15 to 25% of Carnot are now possible.

Table 1. Cryocooler problems.

- Reliability
- Efficiency
- Size and weight
- Vibration
- Electromagnetic Interference (EMI)
- Heat rejection
- Cost

New commercial applications, particularly the use of high temperature superconductors as microwave filters in base stations for wireless communication systems, have stimulated much research on ways to reduce the cost of cryocoolers while still maintaining a lifetime goal of 3 to 5 years. Research on various types of cryocoolers has been carried out with the goal of meeting the requirements for a particular application. As a result, improvements have been made in all the types of cryocoolers. This paper briefly reviews some of the recent advances in pulse tube cryocoolers. More extensive reviews of all cryocoolers[2] as well as pulse tube cryocoolers[3] have been given by the author. The advantages of pulse tube cryocoolers make them natural candidates for the cooling of infrared detectors for both tactical and space applications. Pulse tube cryocoolers are now being developed for many space applications, but the tactical applications have had a particular set of historical requirements that have made it difficult to use pulse tube cryocoolers in place of the Stirling cryocoolers. This paper also discusses some of these problems and how recent advances may make it possible to meet these requirements, at least for larger systems.

2. TYPES OF CRYOCOOLERS

Though the focus of this paper is on pulse tube cryocoolers, a brief introduction of all the cryocooler types is given here because some comparisons will be given later that are more meaningful if there is some understanding of the various types. Figure 1 shows the five types of cryocoolers in common use today. The Joule-Thomson (JT) and the Brayton cryocoolers are of the recuperative type in which the working fluid flows steadily in one direction, with steady low- and high-pressure lines, analogous to DC electrical systems. The compressor has inlet and outlet valves to maintain the steady flow. The recuperative heat exchangers transfer heat from one flow stream to the other over some distance. Recuperative heat exchangers with the high effectiveness needed for cryocoolers can be expensive to fabricate. The three regenerative cryocoolers shown in Fig. 1 operate with an oscillating flow and an oscillating pressure, analogous to AC electrical systems. Frequencies vary from about 1 Hz for the Gifford-McMahon (GM) and some pulse tube cryocoolers to about 60 Hz for Stirling and some pulse tube refrigerators.

2.1 Recuperative Cryocoolers

The steady pressure and the steady flow of gas in these cryocoolers allow them to use large gas volumes anywhere in the system with little adverse effects except for larger radiation heat leaks if the additional volume is at the cold end. Thus, it is possible to "pipe cold" to any number of distant locations after the gas has expanded and cooled. In addition, the cold end can be separated from the compressor by a large distance and greatly reduce the electromagnetic interference (EMI) and vibration associated with the compressor. Oil removal equipment with its large gas volume can also be incorporated in these cryocoolers at the warm end of the heat exchanger to remove any traces of oil from the working gas before it is cooled in the heat exchanger. Unlike conventional refrigerators operating near ambient temperature, any oil in the working fluid will freeze at cryogenic temperatures and plug the system.

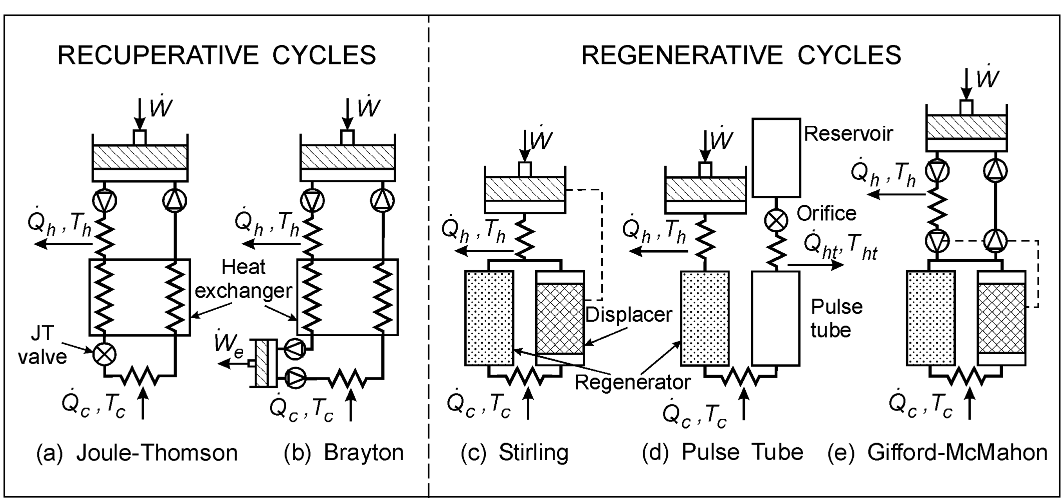

Figure 1. Schematics of five common types of cryocoolers.

2.1.1 Joule-Thomson cryocoolers

The Joule-Thomson cryocoolers produce cooling when the high-pressure gas expands through a flow impedance (orifice, valve, capillary, porous plug), often referred to as a JT valve. The expansion occurs with no heat input or production of work, thus, the process occurs at a constant enthalpy. The heat input occurs after the expansion and is used to warm up the cold gas or to evaporate any liquid formed in the expansion process. In an ideal gas the enthalpy is independent of pressure for a constant temperature, but real gases experience an enthalpy change with pressure. Thus, cooling in a JT expansion occurs only with real gases and at temperatures below the inversion curve. In fact, for a given pressure change the amount of cooling increases as the temperature is lowered and reaches a maximum around the critical point. Typically, nitrogen or argon is used in JT coolers, but pressures of 20 MPa (200 bar) or more on the high-pressure side are needed to achieve reasonable cooling. Such high pressures are difficult to achieve and require special compressors with limited lifetimes.

The main advantage of JT cryocoolers is the fact that there are no moving parts at the cold end. The cold end can be miniaturized and provide a very rapid cool-down. This rapid cool-down (a few seconds to reach 77 K) has made them the cooler of choice for cooling infrared sensors used in missile guidance systems. These coolers utilize a small cylinder pressurized to about 45 MPa with nitrogen or argon as the source of high-pressure gas. In this open-cycle mode, cooling lasts for only a few minutes until the gas is depleted. Figure 2 shows a typical JT cryocooler used for missile guidance. Miniature finned tubing is used for the heat exchanger. An explosive valve is used to start the flow of gas from the high-pressure bottle, and after flowing through the system, the gas is vented to the atmosphere.

A disadvantage of the JT cryocooler is the susceptibility to plugging by moisture of the very small orifice (possibly experienced in a test of the long-range U. S. Missile Defense System in January, 2000). Another disadvantage is the low efficiency when used in a closed cycle mode. Compressor efficiencies are very low when compressing to such high pressures.

Recent advances in JT cryocoolers have been associated with the use of mixed-gases as the working fluid rather than pure gases. The use of mixed gases was first proposed in 1936 for the liquefaction of natural gas[2], but it was not used extensively for this purpose until the last 20 or 30 years. It is commonly referred to as the mixed refrigerant cascade (MRC) cycle. The use of small JT coolers with mixed gases for cooling infrared sensors was first developed under classified programs in the Soviet Union during the 1970s and 1980s. Such work was first discussed in the open literature by Little[4]. Missimer[5] and Radebaugh[2,6] review the use of mixed gases in JT cryocoolers. Typically, higher boiling-point components, such as methane, ethane, and propane can be added to nitrogen to make the mixture behave more like a real gas over the entire temperature range. Enthalpy changes as much as 5 times that with pure nitrogen are possible with pressures of only 2.5 MPa. Such large enthalpy changes then lead to greatly increased efficiencies with the JT cryocooler at pressures that can be achieved in conventional compressors used for domestic or commercial refrigeration. The higher boiling point components must remain a liquid at the lowest temperature. In general, the freezing point of a mixture is less than that of the pure fluids, so temperatures of 77 K are possible with the nitrogen-hydrocarbon mixtures even though the hydrocarbons freeze in the range of 85 to 91 K as pure components. The presence of propane also increases the solubility of oil in the mixture at 77 K so that less care is needed in removing oil from the mixture when using an oil-lubricated compressor. Much research is currently underway pertaining to the solubility of oil in various mixtures and the freezing point of mixtures. Marquardt *et al.*[7] discuss the optimization of gas mixtures for a given temperature range and show how a mixed-gas JT

Figure 2. Open-cycle Joule-Thomson cryocooler for missle guidance.

cryocooler can be used for a cryogenic catheter only 3 mm in diameter. Such miniature systems could also be used for cooling infrared sensors.

2.1.2 Brayton cryocoolers

In Brayton cryocoolers (sometimes referred to as the reverse-Brayton cycle to distinguish it from a heat engine) cooling occurs as the expanding gas does work. Figure 1 shows a reciprocating expansion engine for this purpose, but an expansion turbine supported on gas bearings is more commonly used to give high reliability. According to the First Law of Thermodynamics the heat absorbed with an ideal gas in the Brayton cycle is equal to the work produced. This process is then more efficient than the JT cycle and it does not require as high a pressure ratio. The Brayton cycle is commonly used in large liquefaction plants. For small Brayton cryocoolers the challenge is fabricating miniature turboexpanders that maintain high expansion efficiency. Turbine diameters of about 6 mm on shafts of 3 mm diameter are typical in systems reviewed by McCormick *et al.*[8] for use in space applications of cooled infrared sensors. Turbine speeds of 2000 to 5000 rev/s are typical. Centrifugal compressors providing a pressure ratio of about 1.6 with a low-side pressure of 0.1 MPa are used with these systems. A similar system[9] to be used on the Hubble Space Telescope will provide 7 W of cooling at 70 K. The working fluid used in the turbo-Brayton cryocoolers is usually neon when operating above 35 K, but helium is required for lower temperatures.

An advantage of the Brayton cryocooler is the very low vibration associated with rotating parts in a system with turboexpanders and centrifugal compressors. This low vibration is often required with sensitive telescopes in satellite applications, such as with the Hubble telescope. The expansion engine provides for good efficiency over a wide temperature range, although not as high as some Stirling and pulse tube cryocoolers at temperatures above about 50 K. The low-pressure operation of the miniature Brayton systems requires relatively large and expensive heat exchangers.

2.2 Regenerative Cryocoolers

These cryocoolers operate with oscillating pressures and mass flows in the cold head. The oscillating pressure can be generated with a valveless compressor (pressure oscillator) as shown in Fig. 1 for the Stirling and pulse tube cryocoolers, or with valves that switch the cold head between a low and high pressure source, as shown for the Gifford-McMahon cryocooler. In the latter case a conventional compressor with inlet and outlet valves is used to generate the high- and low-pressure sources. An oil-lubricated compressor is usually used and oil removal equipment can be placed in the high-pressure line where there is no pressure oscillation. The use of valves greatly reduces the efficiency of the system. Pulse tube cryocoolers can use either source of pressure oscillations, even though Fig. 1 indicates the use of a valveless compressor. The valved compressors are modified air conditioning compressors, and they are used primarily for commercial applications where low cost is very important. The main heat exchanger in regenerative cycles is called a regenerator. In a regenerator, incoming hot gas transfers heat to the matrix of the regenerator, where the heat is stored for a half cycle in the heat capacity of the matrix. In the second half of the cycle the returning cold gas, flowing in the opposite direction through the same channel, absorbs heat from the matrix and returns the matrix to its original temperature before the cycle is repeated. Very high surface areas for enhanced heat transfer are easily achieved in regenerators through the use of stacked fine-mesh screen or packed spheres. Gifford-McMahon cryocoolers are seldom used in cooling infrared sensors because of their low efficiency and large size. Their input powers are usually 1 to 6 kW. Therefore, they will not be discussed further.

2.2.1 Stirling cryocoolers

The Stirling cycle, as invented and patented by Robert Stirling in 1815[10], was first used as a prime mover. In 1834 John Herschel proposed its use as a refrigerator in producing ice[11]. It was not until about 1861 that Alexander Kirk reduced the concept to practice[12]. Air was used as the working fluid in these early regenerative systems. Very little development of Stirling refrigerators occurred until 1946 when a Stirling engine at a Dutch company was run in reverse with a motor and was found to liquefy air on the cold tip[13]. The engine used helium as the working fluid, since earlier work at the company showed helium to give much improved performance to the engines. Stirling cryocoolers have been used for about the last

40 years in cooling infrared sensors for tactical military applications in such equipment as tanks and airplanes. They cannot provide the very fast cooldown times of JT cryocoolers, so they are not used on missiles for guidance. The long history of the Stirling cryocooler in cooling infrared equipment has resulted in many specifications being tailored to the geometry characteristics of the Stirling cryocooler. As a result, newer cryocoolers, like the pulse tube cryocooler, with different geometries are difficult to adapt to the geometry specifications.

A pressure oscillation by itself in a system would simply cause the temperature to oscillate and produce no refrigeration. In the Stirling cryocooler the second moving component, the displacer, is required to separate the heating and cooling effects by causing motion of the gas in the proper phase relationship with the pressure oscillation. When the displacer in Figure 1c is moved downward, the helium gas is displaced to the warm end of the system through the regenerator. The piston in the compressor then compresses the gas, and the heat of compression is removed by heat exchange with the ambient. Next the displacer is moved up to displace the gas through the regenerator to the cold end of the system. The piston then expands the gas, now located at the cold end, and the cooled gas absorbs heat from the system it is cooling before the displacer forces the gas back to the warm end through the regenerator. There is little pressure difference across the displacer (only enough to overcome the pressure drop in the regenerator) but there is a large temperature difference. Most actual Stirling cryocoolers have the regenerator inside the displacer instead of external as shown in Fig. 1c. The resulting single cylinder provides a convenient cold finger.

In practice, motion of the piston and the displacer are nearly sinusoidal. The correct phasing occurs when the volume variation in the cold expansion space leads the volume variation in the warm compression space by about 90°. With this condition the mass flow or volume flow through the regenerator is approximately in phase with the pressure. In analogy with AC electrical systems, real power flows only when current and voltage are in phase with each other. Without the displacer in the Stirling cycle the mass flow leads the pressure by 90º and no refrigeration occurs. Though the moving piston causes both compression and expansion of the gas, net power input is required to drive the system. The moving displacer reversibly extracts net work from the gas at the cold end and transmits it to the warm end where it contributes some to the compression work. In an ideal system, with isothermal compression and expansion and a perfect regenerator, the process is reversible. Thus, the coefficient of performance *COP* for the ideal Stirling refrigerator is the same as the Carnot *COP* given by

$$COP_{Carnot} = \frac{\dot{Q}_c}{\dot{W}_0} = \frac{T_c}{T_h - T_c}, \tag{1}$$

where $\dot{Q}_c$ is the net refrigeration power, $\dot{W}_0$ is the power input, T_c is the cold temperature, and T_h is the hot temperature. The occurrence of T_c in the denominator arises from the PV power (proportional to T_c) recovered by the expansion process and used to help with the compression. Practical cryocoolers have *COP* values that range from about 1 to 25% of the Carnot value.

Figure 3 shows the four sizes of Stirling cryocoolers that are currently used for military tactical applications. The refrigeration powers listed for each cooler are for a temperature of about 77 to 80 K, except the 1.75 W system, which is for a temperature of 67 K. Their specified minimum efficiencies range from about 3 to 6% of Carnot as the size increases. All of the coolers shown in Fig. 3 use linear drive motors with a dual-opposed arrangement to reduce vibration. The linear drive reduces side forces between the piston and the cylinder and the Mean-Time-To-Failure (MTTF) is at least 4000 hours. The displacer is driven pneumatically with the oscillating pressure in the system and because there is only one displacer it gives rise to considerable vibration. Efforts are currently underway[14] to increase the MTTF of these Stirling cryocoolers since they are the least reliable component in an infrared system. The development of cryocoolers for space applications has led to greatly improved reliabilities, and a MTTF of 10 years is now usually specified for these applications. The Stirling cooler was first used in these space applications after flexure bearings were developed for supporting the piston and displacers in their respective cylinders with little or no contact in a clearance gap of about 15 μm. Figure 4 shows two examples of flexure bearing geometries used in a compressor. The displacer would use the same type of flexure. These flexure-supported Stirling cryocoolers were initially very expensive, but advances in manufacturing have brought down the price to where these flexures are now being investigated for use in compressors in tactical

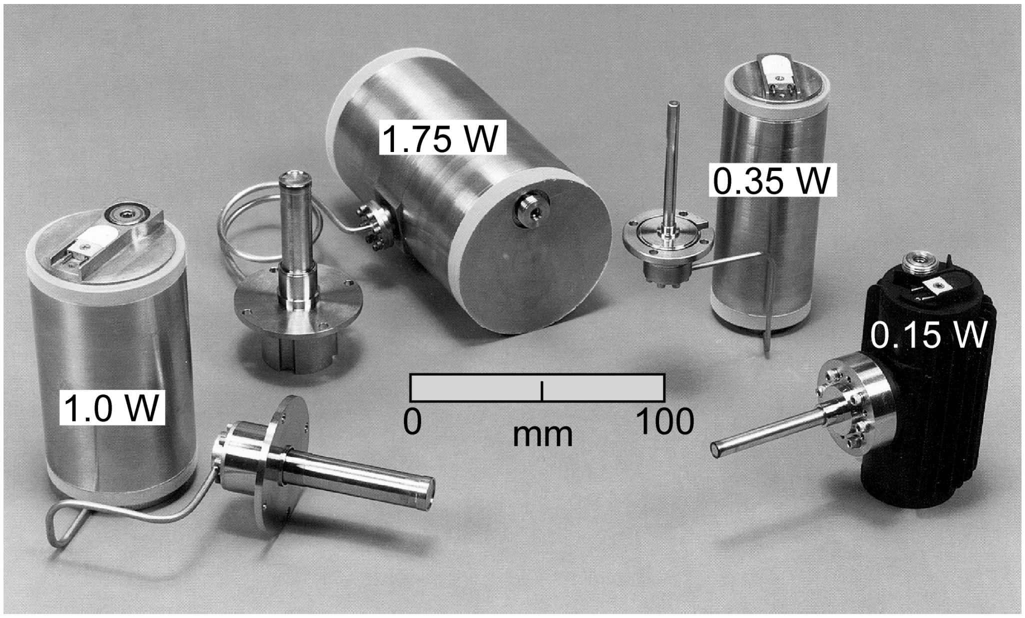

Figure 3. Four sizes of Stirling cryocoolers with dual-opposed linear compressors.

applications. Such compressors would also be useful for pulse tube cryocoolers, since they can use the same type of compressor.

2.2.2 Pulse tube cryocoolers

The moving displacer in the Stirling and Gifford-McMahon cryocoolers has several disadvantages. It is a source of vibration, has a limited lifetime, and contributes to axial heat conduction as well as to a shuttle heat loss. In the pulse tube cryocooler, shown in Figure 1d, the displacer is eliminated. The proper gas motion in phase with the pressure is achieved by the use of an orifice, along with a reservoir volume to store the gas during a half cycle. The reservoir volume is large enough that negligible pressure oscillation occurs in it during the oscillating flow. The oscillating flow through the orifice separates the heating and cooling effects just as the displacer does for the Stirling and Gifford-McMahon refrigerators. The orifice pulse tube refrigerator (OPTR) operates ideally with adiabatic compression and expansion in the pulse tube. Thus, for a given frequency there is a lower limit on the diameter of the pulse tube in order to maintain

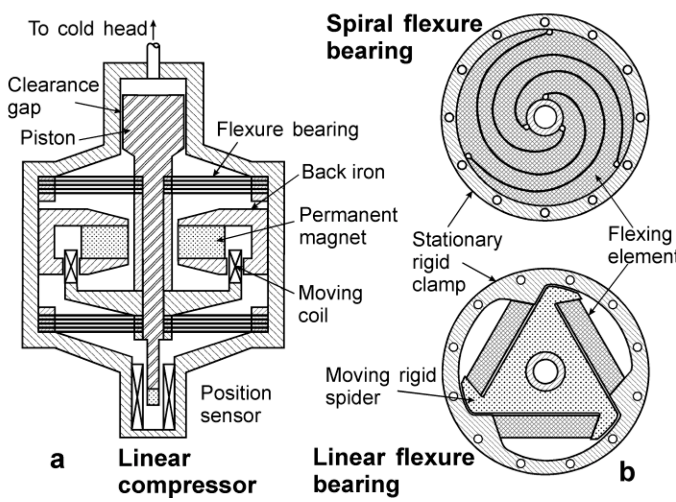

Figure 4. Schematic of (a) linear compressor with (b) two types of flexure bearings.

adiabatic processes. The four steps in the cycle are as follows. (1) The piston moves down to compress the gas (helium) in the pulse tube. (2) Because this heated, compressed gas is at a higher pressure than the average in the reservoir, it flows through the orifice into the reservoir and exchanges heat with the ambient through the heat exchanger at the warm end of the pulse tube. The flow stops when the pressure in the pulse tube is reduced to the average pressure. (3) The piston moves up and expands the gas adiabatically in the pulse tube. (4) This cold, low-pressure gas in the pulse tube is forced toward the cold end by the gas flow from the reservoir into the pulse tube through the orifice. As the cold gas flows through the heat exchanger at the cold end of the pulse tube it picks up heat from the object being cooled. The flow stops when the pressure in the pulse tube increases to the average pressure. The cycle then repeats. The function of the regenerator is the same as in the Stirling and Gifford-McMahon refrigerators in that it precools the incoming high-pressure gas before it reaches the cold end.

One function of the pulse tube is to insulate the processes at its two ends. That is, it must be large enough that gas flowing from the warm end traverses only part way through the pulse tube before flow is reversed. Likewise, flow in from the cold end never reaches the warm end. Gas in the middle portion of the pulse tube never leaves the pulse tube and forms a temperature gradient that insulates the two ends. Roughly speaking, the gas in the pulse tube is divided into three segments, with the middle segment acting like a displacer but consisting of gas rather than a solid material. For this gas plug to effectively insulate the two ends of the pulse tube, turbulence in the pulse tube must be minimized. Thus, flow straightening at the two ends is crucial to the successful operation of the pulse tube refrigerator. The pulse tube is the unique component in this refrigerator that appears not to have been used previously in any other system. It could not be any simpler from a mechanical standpoint. It is simply an open tube. But the thermohydrodynamics of the processes involved in it are extremely complex and still not well understood or modeled. The overall function of the pulse tube is to transmit hydrodynamic or acoustic power in an oscillating gas system from one end to the other across a temperature gradient with a minimum of power dissipation and entropy generation.

Pulse tube refrigerators were invented by Gifford and Longsworth[15] in the mid 1960s, but that type was different than what is shown in Fig. 1d and only reached a low temperature of 124 K. In 1984 Mikulin *et al.*[16] introduced the concept of an orifice to the original pulse tube concept and reached 105 K. In 1985 Radebaugh *et al.*[17] changed the location of the orifice to that shown in Fig. 1d and reached 60 K. Further improvements since then have led to a low temperature limit of about 20 K with one stage and 2 K with two stages. (See discussion in Reference 3.) There are three different geometries that have been used with pulse tube cryocoolers as shown in Fig. 5. The inline arrangement is the most efficient because it requires no void space at the cold end to reverse the flow direction nor does it introduce turbulence into the pulse tube from the flow reversal. The disadvantage is the possible awkwardness associated with having the cold

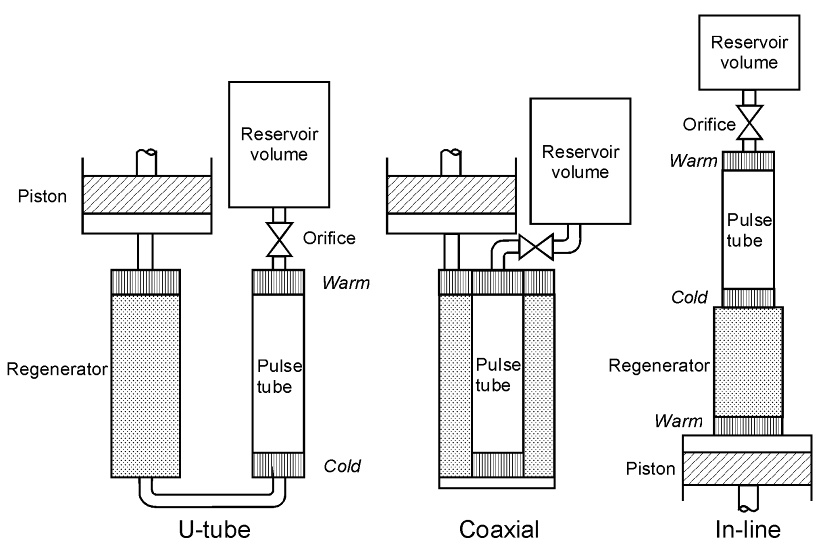

Figure 5. Three different geometries for pulse tube cryocoolers.

plate located between the two warm ends. The most compact arrangement and the one most like the geometry of the Stirling cryocooler is the coaxial arrangement. That geometry has the potential problem of a mismatch of temperature profiles in the regenerator and in the pulse tube that would lead to steady heat flow between the two components and a reduced efficiency. However, that problem has been minimized, and a coaxial geometry has been used as an oxygen liquefier for NASA with an efficiency of 17% of Carnot[18]. The coaxial geometry is the only geometry that could possibly meet the geometry specifications of the Standard Advanced Dewar Assembly (SADA) for second-generation thermal imaging systems[14, 19] of the military. The absence of a moving displacer in pulse tube cryocoolers gives them many potential advantages over Stirling cryocolers for the cooling of infrared sensors. Early pulse tube cryocoolers were not nearly as efficient as Stirling cryocoolers, but advances in the last ten years have brought pulse tube refrigerators to the point of being the most efficient of all cryoolers. Some details of this rapid progress are given in the following section.

3. ADVANCES IN PULSE TUBE CRYOCOOLERS

3.1. Phase Shift Mechanisms

In regenerative cryocoolers the optimum phase relationship between the pressure and the mass (or volume) flow is to have the two in phase with each other near the center of the regenerator. Because of the gas volume in the regenerator the mass flow at the warm end of the regenerator will lead the pressure, but the flow at the cold end will lag the pressure. With such a phase relationship the magnitude of the average mass flow rate through the regenerator for a given PV power is minimized. Because the regenerator losses (such as pressure drop and imperfect heat transfer) depend mostly on the magnitude of the mass flow rate, the regenerator losses are minimized and the system efficiency is maximized. In a Stirling cryocooler, where the displacer is driven, the optimum phase angle can always be achieved. In the orifice pulse tube refrigerator the mass flow rate and the pressure are in phase at the orifice because of the purely resistive nature of the flow impedance in an orifice. In practice the orifice can be any resistive flow element such as an orifice, a needle valve (for adjustment purposes), a capillary, or a porous plug. In all cases the flow through the element is in phase with the dynamic pressure (same as the pressure drop because the pressure in the reservoir is constant). Because of the gas volume in the pulse tube the conservation of mass dictates that the mass flow at the cold end of the pulse tube and regenerator will lead the mass flow at the warm end of the pulse tube (typically about 30° with an optimum pulse tube volume). Consequently, the mass flow at the cold end also leads the pressure instead of lagging the pressure at that location for the minimum regenerator loss. The pressure does not change phase or amplitude through a typical pulse tube, unless frequencies much above 60 Hz are used. The mass flow at the warm end of the regenerator then greatly leads the pressure (perhaps by as much as 60°), which gives rise to a large amplitude of mass flow and causes large regenerator losses for a given PV power flow. Thus, early orifice pulse tube refrigerators were not as efficient as Stirling cryocoolers, and they required a compressor with a larger swept volume. Then mechanisms were found to shift the phase without the need for a moving part.

3.1.1. Double inlet (secondary orifice)

In 1990 Zhu, Wu, and Chen[20] introduced the concept of a secondary orifice to the OPTR in which the secondary orifice allows a small fraction (about 10%) of the gas to travel directly between the compressor and the warm end of the pulse tube, thereby bypassing the regenerator. They called this the double-inlet pulse tube refrigerator. This bypass flow is used to compress and expand the portion of the gas in the warm end of the pulse tube that always remains at the warm temperature. The bypass flow reduces the flow through the regenerator, thereby reducing the regenerator loss. The flow through the secondary orifice is in phase with the pressure drop across the regenerator, which, in turn, is approximately in phase with the flow through the regenerator, averaged over its length. Since the flow usually leads the pressure, so too will the flow through the secondary. This secondary flow then forces the flow at the warm end of the pulse tube to lag the pressure, since the sum of the flows must be in phase with the pressure at the primary orifice. The location of the secondary orifice is shown in Fig. 6, along with that of an inertance tube described in the next section.

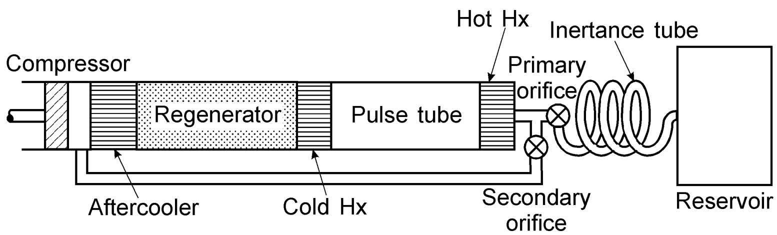

Figure 6. Schematic of pulse tube cryocooler with secondary orifice (double inlet) and inertance tube.

The double-inlet pulse tube refrigerator led to increased efficiencies, particularly at high frequencies where the regenerator losses would be quite high in a simple OPTR. The secondary orifice was incorporated in the mini pulse tube described by Chan *et al.*[21]. This refrigerator produced 0.5 W of cooling at 80 K with only 17 W of input power. About 30 of these mini pulse tube refrigerators have been built and are scheduled for a variety of space missions, mostly for cooling infrared detectors. The secondary orifice has been used on a majority of small pulse tube refrigerators built since about 1991.

3.1.2. DC flow or streaming

Though the introduction of the secondary orifice usually led to increased efficiencies compared to the OPTR, it also introduced a problem. Performance of the double inlet pulse tube refrigerator was not always reproducible, and sometimes the cold end temperature would slowly oscillate by several degrees with periods of several minutes or more. Researchers began attributing this erratic behavior to DC flow that can occur around the loop formed by the regenerator, pulse tube, and secondary orifice. Asymmetric flow impedance in the secondary can cause such a DC flow. Even small DC flow carries a large enthalpy flow from the warm to the cold end because of the large temperature difference at the two ends. In 1997 Gedeon[22] showed that the acoustic power flowing from the warm to the cold end of the regenerator brings about an intrinsic driving force for DC flow or streaming in the same direction as the acoustic power flow. As a result, an asymmetric secondary is required to cancel the intrinsic tendency for this DC flow. In the author's lab the use of a needle valve for the secondary with the needle pointing toward the warm end of the pulse tube resulted in a no-load temperature on a small pulse tube refrigerator of about 35 K. When the needle valve was reversed, the no-load temperature increased to about 50 K. A tapered tube, also known as a jet pump, has also been used to cancel the DC flow[23].

Direct measurements of this small DC flow superimposed on the AC flow would be nearly impossible and have never been attempted. Instead, it is customary to measure the temperature profile on the outside of the regenerator and compare that with the calculated profile or the measured profile when the secondary is closed. Except for very low temperatures the normalized temperature at the midpoint on the regenerator is about 50 to 55% of the total temperature difference. DC flow from the warm end of the regenerator increases the midpoint temperature, whereas flow in the opposite direction reduces the midpoint temperature.

3.1.3. Inertance tube

The conservation of momentum equation for the working fluid is

$$-\frac{\partial \boldsymbol{P}}{\partial x} = \frac{f_r |\dot{m}| \dot{\boldsymbol{m}}}{2 r_h \rho_0 A_g^2} + \frac{\partial}{\partial t}\left(\frac{\dot{\boldsymbol{m}}}{A_g}\right) + \frac{\partial}{\partial x}\left\{\frac{1}{\rho_0}\left(\frac{\dot{\boldsymbol{m}}}{A_g}\right)^2\right\}, \tag{2}$$

and the conservation of mass equation is

$$-\frac{\partial}{\partial x}\left(\frac{\dot{\boldsymbol{m}}}{A_g}\right) = \frac{\partial \dot{\boldsymbol{\rho}}}{\partial t} = \frac{\dot{\boldsymbol{P}}}{R T_0}, \tag{3}$$

where the bold variables represent time-varying complex variables or phasor quantities, $\dot{m}$ is the mass flow rate (positive for flow from compressor to reservoir), x is the coordinate in the flow direction from compressor to reservoir, P is the pressure, f_r is the Darcy friction factor, r_h is the hydraulic radius, ρ_0 is the density at the average temperature and pressure, A_g is the cross-sectional area of the gas perpendicular to the flow direction, R is the gas constant on a mass basis, T is the temperature, and t is the time. The ideal-gas equation of state was used for the last term in Eq. (3). Equations (2) and (3) show phase relationships between flow and pressure. The first term on the right hand side of Eq. (2) represents the flow friction or flow resistance. The last term is important where A_g changes rapidly. The second term on the right hand side of Eq. (2) was usually neglected in the early work with OPTRs since frequencies were low (<60 Hz) and mass flow rates were low. In those cases the pressure drop was in phase with the mass flow. However, at higher frequencies or higher flow rates the second term is no longer negligible in the pulse tube or in other tubes used for the complete system. This second term gives rise to a component of the pressure drop that is in phase with the acceleration of the mass, which for a sinusoidally varying mass flow leads the mass flow by 90°. It represents an inertance effect and is brought about because of the inertia of the oscillating gas. It is analogous to an inductive effect in electrical systems. When combined with the resistive term, the pressure leads the mass flow by something less than 90°. As discussed earlier, this phase shifting at the warm end of the pulse tube is desirable to reduce the magnitude of the flow in the regenerator.

Equation (3) shows that any element that has a finite volume causes a change in mass flow toward the compressor that leads the pressure by 90°, which is opposite to the desired phase shift. Such a phase shift is known as a compliance effect and is analogous to a capacitance effect in electrical systems. The overall change in phase angle from one end to the other in any element is determined by solving both Eqs. (2) and (3). The beneficial phase shift caused by an inertance effect within the pulse tube was first observed in 1996 by Godshalk *et al.*[24] in an OPTR operating at 350 Hz. The inertance effect can be enhanced further by using a long, narrow tube between the pulse tube and the reservoir[2,25,26], as shown in Fig. 6. The primary orifice in Fig. 6 can actually be removed and the entire flow impedance incorporated into the inertance tube. In a pulse tube providing 19 W at 90 K, Marquardt and Radebaugh[18] increased the phase shift further by using an inertance tube with two diameters to provide a phase shift of 43°. The length of both tubes combined was 4.3 m, with the small-diameter tube next to the pulse tube. In much smaller pulse tubes the phase shift is so small that it is of little use, but in much larger pulse tubes the phase shift can be larger than optimum unless the geometry of the inertance tube is adjusted to reduce the phase shift. In small pulse tubes both the secondary orifice and the inertance tube need to be used together to give a desirable phase shift. The advantage of using only the inertance tube is that there is no possibility of DC flow.

3.2. Efficiency of Pulse Tube Cryocoolers

3.2.1. Intrinsic OPTR efficiency

In the ideal OPTR the only loss is the irreversible expansion through the orifice. The irreversible entropy generation there is a result of lost work that otherwise could have been recovered and used to help with the compression. All other components are assumed to be perfect, and the working fluid is assumed to be an ideal gas. The *COP* for this ideal OPTR is given by[27]

$$COP_{ideal} = \frac{\dot{Q}_c}{\dot{W}_0} = \frac{\langle P_d \dot{V}_c \rangle}{\langle P_d \dot{V}_h \rangle} = \frac{T_c}{T_h}, \tag{4}$$

where P_d is the dynamic pressure, $\dot{V}$ is the volume flow rate, and the net refrigeration power is simply taken as the acoustic power at the cold end. The ⟨⟩ symbols indicate a time-averaged quantity. The acoustic power at the hot end of the regenerator is simply the PV power of the compressor. Because the regenerator is assumed to be perfect, the acoustic power varies along its length in accordance with the specific volume, which is proportional to temperature for an ideal gas. The maximum *COP* from Eq. (4) is 1.0, but only when the cold temperature becomes equal to the hot temperature. A comparison of the *COP* from Eq. (4) with the Carnot *COP* from Eq. (1) shows that the only difference is the presence of the T_c term in the denominator of Eq. (1). That term represented the work reversibly recovered at the low temperature and used to help in the compression. The Carnot efficiency of the ideal OPTR is given by

$$\eta_{ideal} = \frac{COP_{ideal}}{COP_{Carnot}} = \frac{T_h - T_c}{T_h}. \quad (5)$$

For T_h = 300 K and T_c = 75 K, η_{ideal} = 0.75. Since practical pulse tube refrigerators have efficiencies less than about 20% of Carnot, the intrinsic loss is dominated by other practical losses when operating at this low temperature. However, for T_c = 250 K, η_{ideal} = 0.17. In that case the lost power at the orifice is a much larger fraction of the total input power. Thus, the OPTR cannot compete with the vapor-compression refrigerator for near-ambient operation. It is useful only for much lower temperatures, especially cryogenic temperatures, unless the acoustic power flow at the warm end of the pulse tube is recovered.

3.2.2. Efficiencies of real pulse tube cryocoolers

Figure 7 shows a comparison of the efficiency of actual pulse tube refrigerators that have achieved high efficiencies. The efficiencies reported here refer to the input electrical power to the compressor. In a few cases the number 85 associated with a data point means that the efficiency was based on compressor PV power that was divided by 0.85 to obtain the electrical input power if an 85% efficient compressor had been used. Such compressor efficiencies are typical of well-designed units. The majority of pulse tube refrigerators reported in the literature have not achieved efficiencies anywhere near these values. Careful attention to details in the design of these high efficiency refrigerators is required and expensive experimental optimization is often required even after the most careful computer modeling and optimizations are performed. In most cases these detailed designs remain proprietary information. Shown for comparison are data for recent, high efficiency Stirling, Gifford-McMahon, Brayton, and mixed-refrigerant Joule-Thomson refrigerators, all operating at temperatures near 80 K. This graph shows a general trend in all refrigerators for increased efficiency as the size increases. The graph also indicates that pulse tube refrigerators have equaled or exceeded the efficiency of the best Stirling refrigerators. As a result, pulse tube refrigerators have now become the most efficient cryocoolers for a given size. Efficiencies as high as 24% of Carnot have now been achieved with pulse tube cryocoolers[28]. As expected, the use of a valved compressor reduces the efficiency of the pulse tube refrigerator to about that of Gifford-McMahon refrigerators.

The minimum efficiencies required for SADA applications are also shown in Fig. 7, but they are much less than what has been achieved in many pulse tube cryocoolers. However, most actual Stirling cryocoolers for this application also have considerably higher efficiencies. The lower cost compressors for

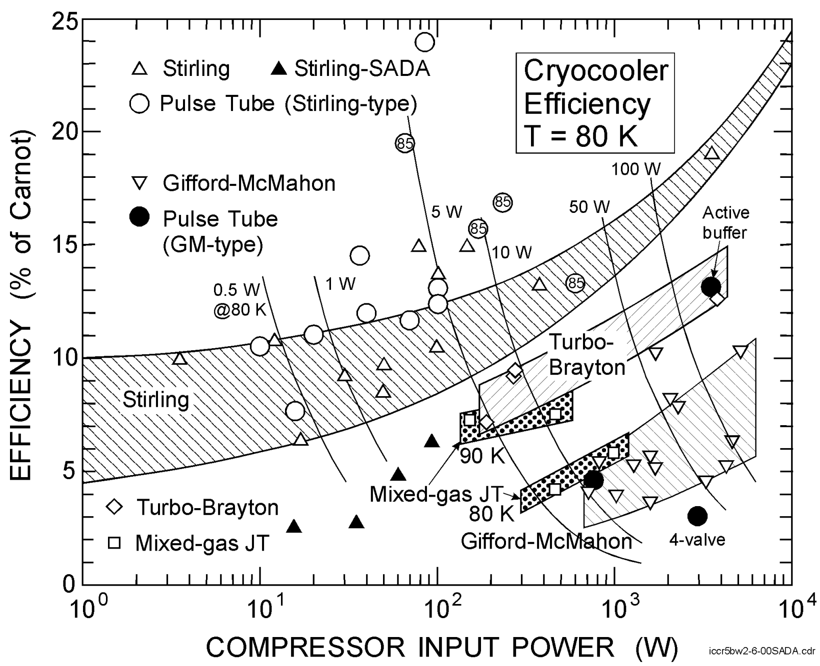

Figure 7. Efficiencies of various types of cryocoolers at 80 K.

the tactical military application are usually only about 65% efficient compared with the 85% typical of compressors for most space cryocoolers. With such compressors most of the Stirling-type pulse tube efficiencies would be reduced from that shown in Fig. 7. However, the data point at 40 W of input power at an efficiency of 12% of Carnot was a pulse tube cryocooler driven with a linear compressor intended for use with a Stirling cryocooler that provides at least 1.75 W at 67 K. The SADA requirement for the maximum input power is 94 W. With a pulse tube cold head the input power was 40 W when providing 1.75 W at 80 K, which is the same as the input power to the system when the original Stirling coldhead was in place[29]. This pulse tube had a U-tube geometry that would not fit inside the envelope specified for the SADA applications.

The earliest pulse tube refrigerator to achieve these high efficiencies was the large NIST pulse tube in 1991 that achieved 31 W at 80 K with 602 W input PV power at 316 K (13% of Carnot assuming an 85% efficient compressor). Within about a year the mini pulse tube refrigerator discussed earlier achieved about 8% of Carnot[21]. Most of the other pulse tube refrigerators with high efficiencies have been developed in the last few years for space applications with funding provided either by NASA or by the U.S. Air Force. The system with 17% efficiency at 222 W of input power is the NIST oxygen liquefier[18] mentioned previously that used the coaxial arrangement. Figure 8 shows this pulse tube cryocooler. Figure 9 shows one of the latest space-qualified pulse tube cryocoolers designed for cooling infrared sensors on the Integrated Multispectral Atmospheric Sounder (IMAS)[30]. It provides 1.0 W cooling at 55 K and 2.5 W at 80 K with only 51 W of input power to the compressor[31] to give an efficiency of 13.5% of Carnot. It uses the latest technology in flexure-bearing compressors to reduce the size and mass of the compressor. Total mass of the compressor and pulse tube cold head is only 3.2 kg. It uses an inline arrangement for the regenerator and pulse tube.

One of the few disadvantages of pulse tube cryocoolers is the potential for gravitationally induced convective instabilities inside the pulse tube whenever the cold end of the pulse tube is raised above the warm end. The effect can be particularly pronounced in the off state, but the oscillating flow in the on state prevents the instability except for pulse tube diameters greater than about 10 mm. Very few measurements have been made of this instability in the on state. Two measurements in our laboratory, one with a 9-mm diameter pulse tube and the other with a 19-mm diameter pulse tube showed no orientation dependence for the first and about a 15 K temperature increase for the second. We expect that even for the 1.75 W SADA application the pulse tube diameter will be less than 10 mm, so this potential problem may not exist for these infrared applications.

4. COOLING INFRARED DETECTORS FOR TACTICAL APPLICATIONS

4.1. Requirements for the Standard Advanced Dewar Assembly (SADA)

Table 2 lists the performance and geometry requirements for cryocoolers used with second-generation thermal imaging systems[14]. As discussed in the previous section the efficiency of many current pulse tube refrigerators greatly exceeds the SADA requirements. The four remaining challenges in the use of pulse tubes for this application are (1) the geometry of the cold finger, (2) the operation at any orientation, (3) the cool-down time, and (4) the additional mass and volume due to the reservoir. The many other SADA requirements not listed in Table 2 should affect the pulse tube cryocooler no differently than they affect the Stirling cryocooler. In fact, the vibration levels with the pulse tube cryocooler should be significantly less

Table 2. Performance and geometry requirements of cryocoolers for second-generation thermal imaging systems.

Requirement \ System	0.15 W	0.35 W	1.0 W	1.75 W
Cooling Capacity @ 23 °C Ambient	0.15 W @ 77 K	0.35 W @ 80 K	1.0 W @ 77 K	1.75 W @ 67 K
Cool-down Time to 80 K	2.5 min w/125 J	10 min w/250 J	13 min w/1440 J	6.5 min w/1200 J
Input Power (max)	17 W	35 W	60 W	94 W
Mass (max)	0.45 kg	1.14 kg	1.91 kg	3.41 kg
Reliability, Min MTTF	4000 hr	4000 hr	4000 hr	4000 hr
Cold Finger Diameter	6.6 mm	5.0 mm	13.7 mm	13.7 mm
Cold Finger Length	57 mm	62 mm	59 mm	59 mm

than those with the Stirling cryocooler because of the lack of moving parts in the cold head. With the SADAs the sleeve for the cryocooler cold finger is built into the dewar. For a Stirling cold head the displacer fits inside this sleeve as shown in Fig. 10a. Figure 10b shows how a coaxial pulse tube would fit into the same sleeve.

4.2. Adapting Pulse Tube Cryocoolers to SADA Requirements

The optimum cross-sectional area of the regenerator in any cryocooler will be proportional to the refrigeration power to a first approximation, and the length as well as the mesh size of the screen regenerator will not change. This scaling law assumes all losses are proportional to the cross sectional area for a fixed flow velocity. This assumption is reasonably good until radiation loss begins to dominate. The cross-sectional area of the pulse tube can also be scaled with the refrigeration power until at some small size the thermal penetration depth in the gas is no longer small compared with the tube radius. At 60 Hz the thermal penetration depth in helium at 300 K is 0.20 mm. We have found that for a pulse tube radius less than about 2.0 mm performance deteriorates quickly because of excessive heat transfer between the gas and the wall. With this size of system the radiation loss also begins to become quite important since it scales with the surface area instead of the cross-sectional area. Most published data on the pulse tube cryocoolers with high efficiencies do not give dimensional data on the regenerators and pulse tubes. However, data from two NIST pulse tube cryocoolers with high efficiencies is available and has been published. The first[18] is the pulse tube oxygen liquefier that produced 15 W at 80 K using a coaxial geometry, and the second[32] is an inline pulse tube cryocooler that produced 2.5 W of cooling at 80 K using the linear compressor from the tactical Stirling cryocooler intended to produce 1.75 W at 80 K. More recent unpublished data with the same compressor and regenerator #4, but with a larger pulse tube (5.33 mm ID x 45.7 mm long) yielded 3.4 W of cooling at 80 K. The compressor PV power at this high refrigeration power was about 100 W and is greater than the SADA specifications. Nevertheless, this data along with the data from the oxygen liquefier can be used to determine the coefficients in the scaling of cross-sectional areas of the regenerators and pulse tubes.

For the regenerator the ratio of inside cross-sectional area to net refrigeration power at 80 K is Ar_q = 0.32 cm^2/W for the 15 W system and 0.28 cm^2/W for the 2.5 W system. To be conservative the higher value will be used for scaling to smaller sizes. The regenerator length was 50 mm for the larger one and 40 mm for the smaller one. Performance of the larger system with a 40-mm long regenerator was almost the same. For the pulse tube the ratios are Ap_q = 0.084 cm^2/W for the large system and 0.057 cm^2/W for the small system. Again, the larger value will be used to be conservative regarding a fit inside the SADA sleeve. The pulse tube lengths were 70 mm for the larger system and 46 mm for the smaller system. Ideally the pulse tube length in a coaxial system should be somewhat longer than the regenerator to match the temperature profiles closely. An extra 10-mm length in the pulse tube compared with the regenerator can be located at the warm end and outside the SADA sleeve. Sleeve lengths for the four SADA systems are in the range of 55 to 60 mm with about 10 mm at the warm end with no temperature gradient.

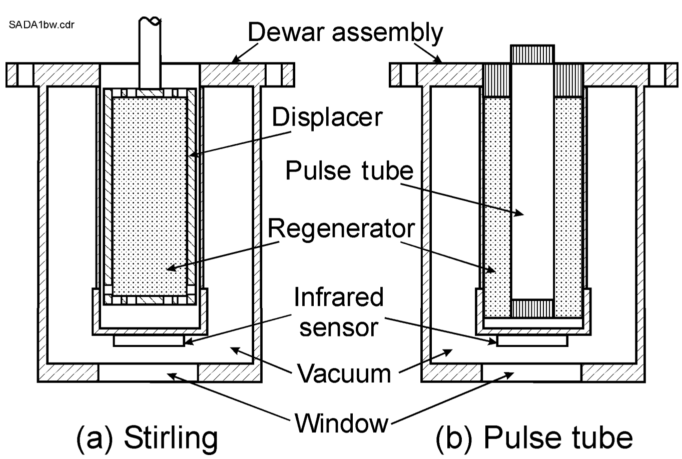

Figure 10. Integration of cryocooler with standard dewar assembly.

With the specific areas given above for the regenerator and the pulse tube along with a pulse tube wall thickness of 0.15 mm and a regenerator wall thickness of 0.25 mm, we obtain the diameters as given in Table 3. For the two smaller systems the pulse tube diameters given in the parentheses indicate the diameters when using the scaling relationship. The 3.0 mm diameter is given next as the minimum allowed diameter to prevent excessive heat transfer with the wall. Regenerator areas were increased by 20% for the 0.15 W system and 10% for the 0.35 W system to allow for degradation of net refrigeration at small sizes. The regenerator areas in parentheses are the values before the 205 and 10% were added. As this table shows, the cold fingers predicted from simple scaling laws applied to previously tested pulse tube cryocoolers have diameters smaller than the SADA requirements, except for the 0.35 W cooler. It may still be possible to meet the requirements for the 0.35 W cooler, but more careful optimization and experimentation would be required. The scaling law used here was for 80 K, but the 1.75 W cooler must provide that cooling at 67 K. Thus more PV power will be required and may increase the diameter of the cold finger some, but it should still be possible to keep it less than 13.7 mm. Because the pulse tube diameter even for the largest cooler is significantly less than 10 mm in diameter, there should be no orientation dependence during operation of any of the four pulse tube coolers. Cool-down times for pulse tube cryocoolers should be quite similar to that of an equivalent Stirling cryocooler because the size and mass of the cold finger is about the same for the two systems. Table 3 also lists the approximate volumes needed for the reservoirs of the various pulse tube coolers. This volume is taken as 50 times the pulse tube volume. Often this reservoir volume is placed internal to the compressor and requires no additional volume and a very small additional mass. That procedure requires that the compressor be designed specifically to accommodate the reservoir. It could also be place external to the compressor as an annular sleeve[28]. An external reservoir could also be made part of the warm end of the cold head, including the use of fins for heat rejection. This extra volume is not significantly more than that required for the pneumatic drive of the displacer in Stirling cryocoolers. Details of the envelope specification for the warm end of the cold head would need to be examined in detail to be able to best incorporate the reservoir volume.

5. CONCLUSIONS

Many advances in pulse tube refrigerators have occurred in the last few years, particularly in methods to increase the efficiency. Several high efficiency pulse tube cryocoolers have been developed for space applications, mostly for cooling infrared detectors. Efficiencies in the range of 10 to 24% of Carnot at 80 K have been achieved in small pulse tube cryocoolers with input powers of 10 to 100 W. Such efficiencies are much higher than the 2.5 to 6.4% efficiencies required of the cryocoolers for the second-generation thermal imaging systems in the Standard Advanced Dewar Assembly (SADA) specifications. With such high efficiencies it should then be possible to make pulse tube refrigerators with coaxial geometries for the pulse tube and regenerator that have small enough diameters and lengths for the cold finger to fit SADA systems. Estimated diameters were determined from scaling laws applied to somewhat larger systems that were very efficient and well characterized. The 1.0 W and 1.75 W coolers should be relatively easy to retrofit. The 0.35 W cooler will require careful optimization and experimentation to develop a pulse tube cooler with such a small diameter cold finger. The 0.15 W cooler with maximum input power of 17 W is

Table 3. Estimated geometry of cold finger for coaxial pulse tube cryocooler.

Geometry \ System	0.15 W	0.35 W	1.0 W	1.75 W
Pulse Tube Area (cm^2)	0.0126	0.0294	0.084	0.147
Pulse Tube ID (mm)	(1.27) 3.0	(1.93) 3.0	3.27	4.33
Pulse Tube OD (mm)	3.3	3.3	3.57	4.63
Regenerator Area (cm^2)	(0.048) 0.058	(0.112) 0.123	0.32	0.56
Regenerator ID (mm)	4.27	5.15	7.31	9.63
Regenerator OD (mm)	4.77	5.65	7.81	10.03
Reservoir Volume (cm^3)	(3.8) 21	(3.8) 21	25	44
Required Cold Finger OD (mm)	6.6	5.0	13.7	13.7
Required Cold Finger Length (mm)	56.8	61.6	58.5	58.5

near the lower limit of size for efficient pulse tube cryocoolers. Fortunately, the cold finger diameter is not particularly small for this cooler, but the challenge on this system is to maintain high efficiency with such a small compressor. The small pulse tubes in these systems should not experience any orientation dependence. Several possible locations for the reservoir volume were discussed.

ACKNOWLEDGEMENTS

I appreciate the valuable discussions with W. E. Salazar and R. M. Rawlings regarding the requirements and characteristics of linear Stirling cryocoolers in the cooling of infrared detectors. I also wish to thank R. M. Rawlings for the loan of two linear Stirling compressors for our use in the development of small pulse tube cryocoolers.

ABSTRACT

The Standard Advanced Dewar Assembly (SADA) is the critical module in the Department of Defense (DOD) standardization effort of second-generation thermal imaging systems. DOD has established a family of SADAs to address high performance (SADA I), mid-to-high performance (SADA II), and compact class (SADA III) systems. SADAs consist of the Infrared Focal Plane Array (IRFPA), Dewar, Command & Control Electronics (C&CE), and the cryogenic coolers. SADAs are used in weapons systems such as Comanche, the M1 Abrams tank, the M2 Bradley fighting vehicle, and the Javelin CLU.

The linear drive cryocoolers maintain the Infrared Focal Plane Arrays (IRFPAs) at the desired operating temperature. Stirling linear drive cryocoolers are being used in place of Stirling rotary coolers. DOD has defined a family of tactical linear drive coolers in support of the family of SADAs. These coolers are required to have low input power, a quick cool-down time, low vibration output, low audible noise, and higher reliability. This paper (1) outlines the characteristics of each cooler, (2) presents the status and results of qualification tests, and (3) presents the status and test results of efforts to increase cryocooler reliability. Flexure-spring designs of the 0.15 watt and 1.0 watt coolers are currently in reliability growth testing.

INTRODUCTION

The US Department of Defense (DoD) has chartered a strategy to standardize second generation infrared (IR) components throughout the services. A family of second-generation (2^{nd} Gen.) infrared-imaging critical components called the Standard Advanced Dewar Assemblies (SADA's) has been developed to support this strategy. SADA I is designed to address requirements for high performance systems, SADA II for mid-to-high performance, and SADA III for compact class systems. SADAs consist of the Infrared Focal Plane Array (IRFPA), dewar, Command & Control Electronics (C&CE), and the cryogenic cooler.

The US Army CECOM Night Vision and Electronics Sensors Directorate (NVESD) has developed a family of Stirling cycle linear drive coolers, shown in Fig. 1, in support of this standard-

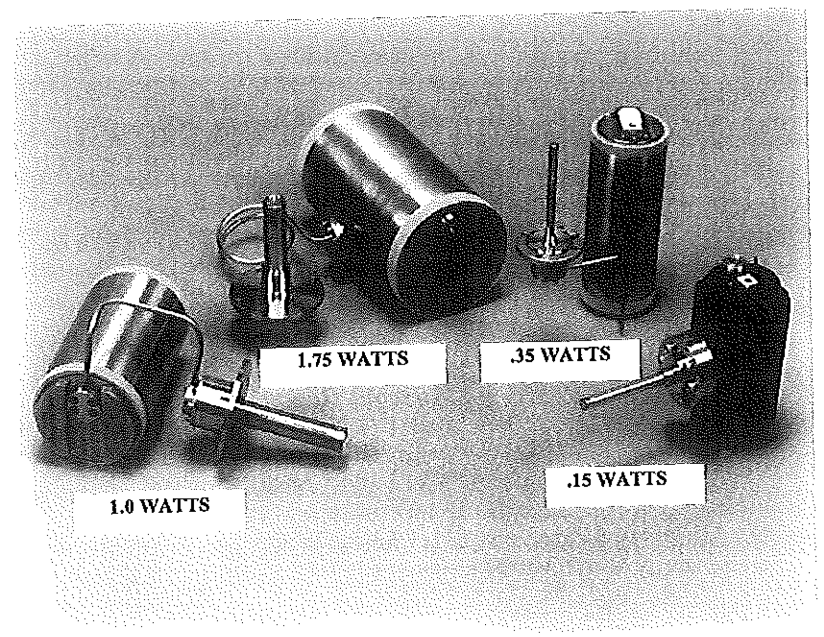

Figure 1. Family of linear drive coolers.

ization effort.[1] These coolers address the shortcomings of rotary coolers such as low reliability, poor shelf life, multi-axes vibration & torque, excessive acoustic noise, and poor temperature stability of the detector array. This paper highlights the latest developments and results involving US Army programs for linear drive coolers. Table 1 highlights the key parameters of the family of coolers.

Table 1. Key Parameters for the Family of Linear Drive Coolers (LDC's)

Requirements	0.15 watt	0.35 watt	1.0 watt	1.75 watt
Cooling Capacity @ 23C in any orientation	0.15 watt @ 77K	0.35 watt @ 80K	1.0 watt @ 77K	1.75 watt @ 67K
Cool-down time to 80K @ 23C (max)	2.5 minutes w/125 Joules	10 minutes w/250 Joules	13 minutes w/1440 Joules	6.5 minutes w/1200 joules
Input power (max)	17 W	35 W	60W	94W
Temperature regulation	+/- 0.5K	+/- 0.5 K	+/- 0.5 K	+/- 0.5 K
Operating Voltage	10.8 VAC	17-32 Vdc	17-32 Vdc	24-32 Vdc
Vibration Output (max)	0.25 lbf	0.5 lbf	0.5 lbf/ 0.75 lbf in Dewar axis	0.5 lbf
Weight (max)	1.0 lbs	2.5 lbs	4.2 lbs	7.5 lbs
Reliability (minimum Mean Time to Failure)	4000 MTTF	4000 MTTF	4000 MTTF	4000 MTTF
Electromagnetic compatibility	MIL-STD-461 Modified	MIL-STD-461 Modified	MIL-STD-461 Modified	MIL-STD-461 Modified
Shelf Life	10 years	10 years	10 years	10 years
Operating Environment	-32C to +70C	- 54C to +71C	- 54C to +71C	- 54C to +71C

Table 2. List of Qualification Tests

QUALIFICATION TESTS	DESCRIPTION
• LEAK RATE *	Ensure 10-year shelf life
• BASELINE PERFORMANCE TESTING * • Verify critical performance requirements at environmental temperatures of 23C, +71C and -54C (-32C for 0.15W)	• Key Performance Parameters • Cool-down time • Input Power • Cooling Capacity • Temperature control
• AUDIBLE NOISE *	Test to ensure compliance to required sound levels
• VIBRATION OUTPUT LEVELS *	Measure force generated by the cooler along principal axes
• HIGH TEMPERATURE *	Test to demonstrate operation of coolers after +71C storage temperature
• LOW TEMPERATURE *	Test to demonstrate operation of coolers after −62C storage temperature
• TEMPERATURE SHOCK *	Test to demonstrate coolers survive sudden temperature changes from −62C to 71C
• MECHANICAL SHOCK	Test to demonstrate coolers are operational while being subjected to high intensity shocks in all axes
• MECHANICAL VIBRATION	Test to demonstrate coolers are operational while being subjected to vibration (specified by platform) in all axes
• ELECTROMAGNETIC RADIATION	Test to ensure compliance to radiated emissions and susceptibility requirements
• RELIABILITY TEST (4000 HOURS MEAN TIME TO FAILURE) *	Coolers log 4,000 operating hours while undergoing 3-day temperature cycling from –32C to +52C
• PHYSICAL CONFIGURATION AUDIT *	Measure size, weight Verify interface with FPA/Dewar assembly

* NVESD In-house Testing Capability

QUALIFICATION REQUIREMENTS FOR CRYOCOOLERS

SADAs and linear drive coolers are products that require qualification prior to first delivery. These components are qualified once they pass through a series of tests approved by NVESD and the procurement activity. The government or the cryocooler manufacturer may perform these tests. The government approves all test procedures, equipment, and test facilities prior to testing. Some of the weapon systems supported by this qualification effort include the Army's Second Generation Forward Looking Infrared (FLIR) Horizontal Technology Integration (HTI), Comanche, Apache, Javelin, Improved TOW Acquisition Sensor, and Long Range Advanced Scout Sensor Suite (LRAS3). The tests in Table 2 are part of the qualification effort for linear drive coolers.

0.15-WATT LINEAR DRIVE COOLERS

The 0.15-watt linear drive cooler was developed for second-generation FLIR man-portable applications. The 0.15-watt cooler from DRS Infrared Technologies (formerly Texas Instruments) was originally qualified in 1997 for use in the Javelin Command Launch Unit (CLU). Javelin is an anti-tank missile system.

This 0.15-watt cooler was re-qualified in 1999 following an Army funded Manufacturing Technology (Mantech) program with DRS.[2,3] This Mantech program was performed on both the 0.15-watt and 1.0-watt coolers with funding from the US Army Mantech program, the Program Manager for Night Vision Reconnaissance, Surveillance and Target Acquisition (PM-NV/RSTA), and the Program Manager for Javelin. It developed new production techniques and processes that reduced the cost to manufacture the 0.15-watt cooler by 30%. It focused on process improvements to the compressor clearance seals, gas decontamination process, motor manufacturing, and cooler final assembly. It also replaced the compressor helical spring suspension system with a flat plate, flexure spring, suspension system. The goal of changing to a flexure springs system was to simplify motor assembly and double the life of the coolers from 4,000 to 8000 hours MTTF. A significant cost avoidance will be realized due to lower manufacturing costs and higher reliability coolers, and the potential production requirement for more than 7,000 of these coolers in the next 15 years.

The 0.15-watt Javelin cooler with flexure springs is currently in full-scale production. It passed all required Javelin detector dewar cooler assembly performance and qualification tests prior to production.

Three Javelin coolers began life testing on February 1, 1999 at DRS. These life test coolers have accumulated an average of 4777 relevant hours of operation through January 28, 2000. Two units, MSN 18 and MSN 13, have 5289 hours each and the third unit has 3754 hours since being returned to the life test. Javelin cooler numbers 18 and 13 have been failure free. The only anomaly during the period occurred when the chamber failed to hold the prescribed temperatures during the cycle.

1.0-WATT LINEAR DRIVE COOLERS

The 1.0-watt cooler is the focus of significant efforts and investments to qualify multiple sources, reduce manufacturing costs, and increase their reliability. These coolers are used with SADA II, and are critical components of many DoD programs to include the Army's 2nd Generation FLIR Horizontal Technology Integration (2nd Gen. FLIR HTI) program and the improved TOW acquisition system.

Status of Qualification Efforts

The DRS Infrared Technologies 1.0-watt coolers were first qualified in 1997. DRS is one of the main suppliers of 1.0-watt coolers to the Army. AEG Infrared Modules (AIM) of Germany is also a qualified supplier. AIM was qualified in 1998 through a Foreign Comparative Testing (FCT) program with NVESD and the Army's Program Manager for FLIRs (PM FLIR). The FCT program provided funds to purchase and test several AIM coolers. Both cooler manufacturers demonstrated reliability over the 4,000-hour MTTF requirement. DRS coolers accumulated an average of 6,486 hours and the AIM coolers accumulated 4,753 hours.

Qualification testing of Litton Life Support 1.0-watt coolers is near completion. These coolers have passed most formal qualification tests. Only the Electromagnetic Radiation and the reliability tests remain to be completed. The coolers have accumulated an average of 2,500 hours in reliability testing. NVESD and PM FLIR support Litton's formal qualification testing.

Manufacturing Technology (Mantech) Efforts

The 1.0-watt cooler was also the beneficiary of an Army Mantech effort that resulted in a 32% decrease in cooler manufacturing costs at DRS. As mentioned before, this Mantech program was performed on both the 0.15-watt and 1.0-watt coolers with funding from the US Army Mantech program, the Program Manager for Night Vision Reconnaissance, Surveillance and Target Acquisition (PM-NV/RSTA), and the Program Manager for Javelin. This Mantech program focused on manufacturing process improvements to the compressor clearance seals, gas decontamination process, regenerator/expander design, motor manufacturing, and cooler final assembly. The Mantech effort was completed in 1998 with the completion of environmental and reliability tests. This program established a lower cooler price threshold that is impacting the competitive procurement of current and future procurements (12,000 coolers projected in the next 20 years). In order to maximize competition, the Mantech program included a technology transfer effort that provided DRS reports and briefings to approved cooler manufacturers.

Reliability Improvements

The DRS 1.0-watt cooler with flexure springs is currently in qualification and life testing. This effort is funded by the Army's Operation and Support Cost Reduction (OSCR) Program and managed by NVESD. The goal is to increase the life of the 1.0-watt cooler from 4,000 hours to 8,000

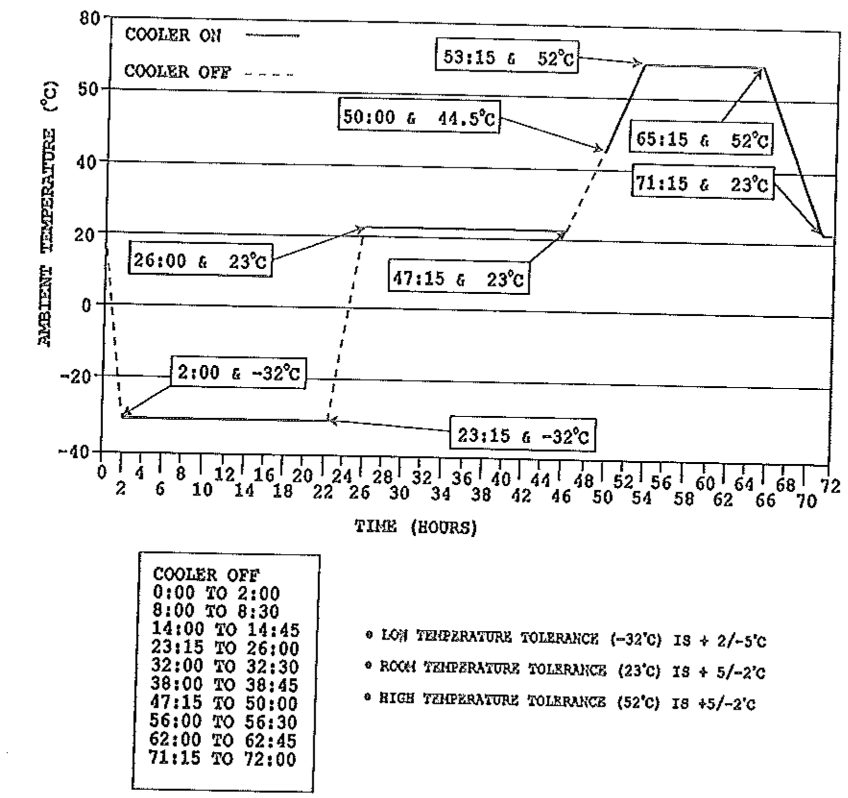

Figure 2. Reliability Test Profile, 1.0-watt linear cooler with external electronics.

hours Mean Time to Failure (MTTF) in order to reduce operation and support costs. The lessons learned in the development of the DRS 0.15-watt Javelin cooler with flexure springs were applied to the 1.0-watt cooler effort.

Figure 2 depicts the reliability test profile for 1.0-watt coolers. Six 1.0-watt coolers with flexure springs have been built, and test results show that they match the performance of the 1.0-watt coolers (helical springs) currently qualified and in production. Several modifications have been necessary since testing started in 1999. One modification deals with the addition of more rugged clamping mechanisms after the flexure spring stack shifted during the mechanical shock and mechanical vibration tests.

Reliability testing on three 1.0-watt coolers with flexure springs began on April 16, 1999. One unit was removed from testing due to unacceptable vibration output levels. A defective magnet assembly caused the unacceptable vibration output levels. This unit was replaced with two additional coolers to total four coolers in life test. These reliability test coolers have surpassed the required 4,000 relevant hours of operation with an accumulated average count of 4,600 hours. Testing will continue until 8,000 hours MTTF are demonstrated or until failure of the coolers. Additional tests are required to demonstrate full conformance to qualification requirements.

1.75-WATT LINEAR DRIVE COOLERS

The 1.75-watt cooler is designed to address the needs of the high performance second generation infrared imaging systems that will use a SADA I or other equivalent performing system whose cooling capacity requirements or faster cool-down times cannot be met with a 1.0-watt cooler. These coolers are currently used in many DoD programs to include the Army's Comanche and Apache helicopters.

Several AIM 1.75-watt coolers were purchased and are undergoing evaluation and formal qualification testing as part of a Foreign Comparative Test (FCT) program with NVESD and the Program Manager for Comanche (PM Comanche). Several 1.75-watt coolers have been successfully integrated into Comanche, Apache, and several other high performance FLIR systems to include Quantum Well FLIRs. The production requirement for these coolers is estimated at over 8,000 in the next 20 years.

FUTURE COOLER EFFORTS

Army efforts will continue to focus on reducing manufacturing costs, improving reliability, and improving the performance of the family of linear drive Stirling cryocoolers.

NVESD, PM NV/RSTA, and PM Comanche are supporting efforts to increase the reliability of 1.0-watt coolers to 12,000 hours MTTF and the 1.75-watt cooler to 8,000 hours MTTF. Fiscal year 2001 funds are possible for these efforts. A related effort will aim to reduce the manufacturing costs of the 1.75-watt coolers through the transfer of manufacturing processes developed under the 1.0-watt and 0.15-watt cooler Mantech program.

With the advent of longer life coolers (8000-12,000 hours) there is a need to develop a method to shorten the reliability testing while demonstrating cooler life. NVESD is exploring alternatives to the current reliability test method. The current test method demonstrates cooler life by actually running the coolers until failure. With the current method the coolers accumulate 450 hours of runtime per month. It will take 30 months to demonstrate a 12,0000-hour cooler introduction of a valid accelerated reliability test. The cooler is still the least reliable component in FLIR systems and there is a need to accelerate the introduction of longer life cryocoolers into DoD systems.

SUMMARY

A family of second-generation (2nd Gen.) infrared-imaging critical components called the Standard Advanced Dewar Assemblies (SADA's) has been developed to support a DoD standardization strategy. A family of linear drive coolers has also been established in support of this standardization strategy.

The US Army CECOM Night Vision Directorate in conjunction with several US Army Program Managers has embarked in linear drive cooler efforts aimed at qualifying coolers, reducing cooler prices, and increasing cooler reliability.

Qualification test efforts for the DRS 0.15-watt flexure spring and for the DRS & AIM 1.0-watt coolers were successfully completed in the last five years. Qualification testing for the 1.75-watt AIM cooler and two additional 1.0-watt cooler designs (DRS flexure springs and Litton) is ongoing. Some of the weapon systems supported by these qualification efforts include the Army's Second Generation Forward Looking Infrared (FLIR) Horizontal Technology Integration (HTI), Comanche, Apache, Javelin, Improved TOW Acquisition Sensor, and Long Range Advanced Scout Sensor Suite (LRAS3).

The US Army Manufacturing Technology program and the Operation and Support Cost Reduction program were successful in reducing manufacturing costs and in implementing flexure spring designs aimed at increasing the reliability of the 0.15-watt and 1.0-watt coolers. Additional work is planned to transfer these improvements to the 1.75-watt coolers and to further increase the reliability of 1.0-watt coolers.

ABSTRACT

The Air Force Research Laboratory (AFRL) has been instrumental in advancing sp cryocooler technology through cryocooler development and characterization of the. long-t performance of different types of cryocoolers. These coolers were developed to support long life space mission requirements of the United States Air Force SBIRS-Low Program fice, the Ballistic Missile Defense Organization (BMDO), the National Aeronautics and Sp Administration and the Department of Defense. Long life cryocooler applications include cc ing infrared sensors, focal planes, optics and electronic circuits for various space missions national interest.

The main objective of this paper is to present the status of the cryocoolers currently unc going characterization and endurance evaluation at AFRL. The information gained through these processes is shared with industry partners, cryocooler developers, technology sponsors, and technology users. This feedback is essential for cryocooler design enhancements and future cryogenic technology development efforts. There are two cryocoolers undergoing characterization at AFRL. These include the Astrium (formerly Matra Marconi Space) 10 K Cryocooler, and the TRW 150 K miniature pulse tube (150K MPT). In addition, there are five cryocoolers undergoing endurance evaluation at AFRL These include the Raytheon Protoflight Spacecraft Cryocooler, Raytheon Standard Spacecraft Cryocooler (SSC) II, TRW 3585, TRW 6020, and the Defense Evaluation and Research Agency (DERA) cryocooler. This paper includes each cryocooler's status, and update or initial report on its performance, elapsed runtime hours, performance anomalies and updated characterization and endurance evaluation data.

INTRODUCTION

The most critical characteristics of cryocoolers for strategic space applications are lifetime and reliability. This is what distinguishes them from their short-term tactical cousins. The primary purpose of the Air Force Research Laboratory Cryogenic Cooling Research Facility (CCRF) is to explore the thermodynamic performance characteristics of one-of-a-kind or first-of-a-kind engineering design model or protoflight space cryocoolers and assess their lifetime and

RE: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII, RIN: 1400-AD32

To Whom It May Concern:

ChemImage Corporation wishes to comment on the Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII, published on May 5, 2015. ChemImage Corporation is a small chemical imaging company founded and headquartered in Pittsburgh, PA. Our products utilize hyperspectral chemical imaging technologies for chemical and biological applications in numerous industries, including forensic analysis, threat detection, pharmaceutical testing, and biomedical imaging.

ChemImage Corporation uses short-wave infrared (SWIR) InGaAs focal plane arrays in many of its products. Our technologies integrate these InGaAs focal plane arrays into permanently encapsulated sensor assemblies, which secure the focal plane array inside the product. Our products are dual-use in nature. Our LightGuard and VeroVision products, for example, may be configured to detect a wide range of chemicals and can distinguish innocuous compounds such as sugar and salt from various drugs, explosives, and explosive precursors. They are, in essence, molecular materials analysis tools suitable for a vast range of applications, from detecting ice on a roadway to identifying illicit drugs in prison mail. We have marketed these products for wide area surveillance monitoring at everything from sporting events to airport screenings.

Under the current rule, InGaAs focal plane arrays are captured under Category XII(c) of the ITAR. This has introduced significant challenges to our development and marketing of our products. The current Category XII is designated as Significant Military Equipment, and, as such, requires the completion and submission of DSP-83 form with the request of an export license. We have found great barriers in applying for demonstration licenses to exhibit our products at trade shows, and are challenged by the length of time involved in applying for and receiving licenses. For a company whose products may be configured to detect innocuous as well as harmful chemicals, the months-long procedure to merely ask permission for a demonstration—with no transfer of technology or materiel—has been onerous.

To that end, we wish to comment on the proposed rule for Category XII, specifically on sections (c)(2) and (c)(6). First, we wish to ask for clarification on what is meant by a "multispectral detector," and request that this be further defined in this section. Second, we request clarification on the term "integrated into a permanent encapsulated sensor assembly." Does the proposed rule require a particular standard of permanence? With regards to the proposed Category XII(c)(6), we find the drafting unclear. Section (c)(2) indicates that "multispectral detectors…having a peak response within the wavelength rage exceeding 900nm but not exceeding 30,000 nm and <u>not</u> integrated into a permanent encapsulated sensor assembly" are included under the section, but Section (c)(6) contradicts by stating that "Multispectral IRFPAs in a permanent encapsulated sensor assembly, having a peak response in any spectral band within the wavelength range exceeding 1,500 nm but not exceeding 30,0000" (emphasis added). This language invites further confusion for companies like ChemImage, who use SWIR focal plane arrays using wavelengths from 900 nm to 1700nm, fully encapsulated in a permanent sensor assembly.

While we are aware that the current Category XII(c) states "military infrared focal plane arrays identified…are licensed by the Department of Commerce …when part of a commercial system," the current proposed draft of Category XII invites more confusion for us. We reiterate the fact that cameras such as those used in our products may be used for a variety of non-military applications, and that the continual placement of such components on the U.S. Munitions List provides a chilling effect to companies both large and small.

We urge you to clarify the proposed language within Category XII and to remove the inherent barriers to marketing and selling systems that integrate SWIR focal plane arrays under the ITAR.

Should you wish additional comment from ChemImage Corporation, please do not hesitate to contact the undersigned at santosj@chemimage.com or via telephone at 412-241-7335 x234.

Sincerely,

Juvyrose V. Santos
Export Compliance Officer, ChemImage Corporation

Subjects: RIN 0694-AF75 - Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, Optical, and Guidance and Control Equipment the President Determines No Longer Warrant Control Under the United States Munitions List (USML)

and RIN 1400-AD32 Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

Dear Sir or Madam:

The Computing Technology Industry Association (CompTIA) is a non-profit trade association serving as the voice of the information technology industry. With approximately 2,000 member companies, 3,000 academic and training partners and nearly 2 million IT certifications issued, CompTIA is dedicated to advancing industry growth through educational programs, market research, networking events, professional certifications and public policy advocacy.

Thank you for the opportunity to provide comments on the Export Administration Regulations (EAR) proposed rule which describes how articles the President determines no longer warrant control under Category XII (Fire Control, Range Finder, Optical and Guidance and Control

Equipment) of the United States Munitions List (USML) of the International Traffic in Arms Regulations (ITAR) would be controlled under the Commerce Control List (CCL) by creating new ``600 series'' Export Control Classification Numbers (ECCN)s 6A615, 6B615 and 6D615 for military fire control, range finder, and optical items, by revising ECCN 7A611 and by creating new ECCNs 7B611, 7C611 and 7E611 for military optical and guidance items. In addition, for certain night vision items currently subject to the EAR, this rule proposes to expand the scope of control, eliminate the use of some license exceptions, and create new ECCNs for certain software and technology related to night vision items. This proposed rule would also expand the scope of end-use restrictions on certain exports and reexports of certain cameras, systems, or equipment and expand the scope of military commodities described in ECCN 0A919.

The Department of State rule proposes to amend the ITAR to revise Category XII of the USML to describe more precisely the articles warranting control on the USML.

Optics technologies are playing a key role across many industries today. In the commercial automotive sector for example, LIDAR, radar, and camera systems are being used to anticipate and prevent crashes and significantly improve passenger safety. In early June, the National Transportation Safety Board recommended vehicle manufacturers install forward collision avoidance systems as standard features on all newly manufactured passenger and commercial motor vehicles since the technology would be capable of preventing nearly 4,500 rear-end crashes per day. Similarly, in the aviation sector, LIDAR technologies are playing a key role in providing the imagery necessary for the provision of adequate geographic information as a part of the FAA's NextGen program, aimed at improved aviation efficiency and safety. Given these key use cases, and many others, CompTIA's members are committed to ensuring that these critical technologies continue to advance and provide vital public and private sector benefits, as changes to the USML Category XII take place.

CompTIA has the following comments on RIN 1400-AD32 and RIN 0694-AF75:

> ***Cat. XII(b)(6): Light detection and ranging (LIDAR), laser detection and ranging (LADAR), or range-gated systems or equipment, incorporating or specially designed to incorporate an article controlled in this subchapter (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km);***
>
> ***Note to paragraph (b)(6): This paragraph does not control LIDAR systems or equipment for civil automotive applications having a range limited to 200 m or less.***

This proposed provision would capture LIDAR systems used in self-driving car applications even if the system is solely designed for civil automotive applications. This is because it would not qualify for the "Note to paragraph (b)(6)" (hereinafter, referred to as "Civil Automotive Exception"). Specifically, a system would not meet the criteria of the Civil Automotive

Exception if the range of the LIDAR system exceeds the range of 200m. It is our belief that many commercial companies are developing self-driving car LIDAR technology that would indeed exceed 200m. In particular, we believe that the range must exceed 200m for safety reasons. For example, the system's range needs to be greater than 200m when the vehicle is making unprotected left turns in the presence of cars that are driving at higher speeds regardless of whether they decelerate or not. A greater than 200m range is also necessary for spotting oncoming emergency vehicles so that the self-driving car can safely pull over and move out of the path of such vehicles. Furthermore, in rural areas where speed limits tend to be higher, being able to detect oncoming traffic at a greater range than 200m is again important from a safety perspective.

Recommendation: We request that the range in the Civil Automotive Exception be increased to 400m to account for current technology developments geared towards safety on the road as well as future innovation in this space.

> ***Cat. XII(b)(8): LIDAR, LADAR, or other laser range-gated systems or equipment, as follows (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km): (iii) Systems or equipment having an electrical bandwidth of 100 MHz or greater, and incorporating or specially designed to incorporate either a Geigermode detector array having at least 32 elements or a linear-mode detector array having at least 128 elements.***

This proposed provision potentially captures LIDAR systems used in civil automotive applications. Specifically, "incoming" bandwidth refers to detector bandwidth and determines minimum resolvable pulse length, which, in turn, drives minimum detectable feature separation. For a self-driving car, a sufficiently short light pulse and the ability to resolve this pulse allows the car to effectively distinguish between objects that are positioned on the same vector with respect to the car, and that are spatially close, such as a pedestrian standing near a car. Detector bandwidth determines the minimum width (in the time domain) of a resolvable pulse, which corresponds to the physical length of a collection of photons in the spatial domain. A long light pulse of 10ns (which would equate to 100 MHz) is 3 m long and could reflect off a pedestrian and also a vehicle 1m away from the pedestrian; a light pulse of 1ns (which would equate to 1000 MHz) is 30 cm long and would have separate reflections off the pedestrian and vehicle generating much more of an accurate read-out of obstacles in the vicinity. In short, having a bandwidth of 1000 MHz allows the system to distinguish between objects/people that are spatially close and on the same vector and to react accordingly to achieve road safety goals. A clock bandwidth of 100 MHz is lower than many common operating bandwidths; the clock in a processor that would control even a trivial LIDAR system could be expected to run faster than 100 MHz. Furthermore, a receiver analog bandwidth of 100 MHz is lower than a common detector and amplifier could be expected to have (and much slower than many currently available components). If the proposed control is intended to address “incoming” or detector bandwidth, it would likely capture many standard commercially available LIDAR systems that are intended and designed for civil automotive self-driving car applications.

In addition to the bandwidth considerations noted above, we also put forth that the trigger point of 128 elements is too restrictive from a safety perspective for civilian self-driving car applications. Specifically, such cars need a LIDAR system to detect with accuracy foreign objects and debris (“FOD”) on the road. The typical range of angle of slope on a road is +/-8 deg. The car needs to be a certain distance away from the FOD in order to react to it safely (150 m), and a typical dangerous FOD is 15 cm tall. This means that the sensor requires on the order of 250 detectors to cover the complete field of view with enough resolution to maintain safety.

Driver-assistance cars do not need this same level of FOD detection mainly because a driver would be able to step in and react whereas in a self-driving car, the system itself needs to react. As such, this parameter, as currently worded, would actually discourage safety for civilian self-driving cars.

Foreign availability: we note that many foreign manufacturers have developed technology in this space. Specifically, Reigl, an Austrian company, Sick AG, a German company and Hokuyo LTD, a Japanese company have all developed LIDAR systems that operate at over 100 MHz. The companies FirstSensor, Hamamatsu and SensL also develop similar systems for commercial applications.

Recommendation: We request that the same Civil Automotive Exception (with the amendment of extending the range to 400 m) that appears in the Note to paragraph (b)(6) be included in (b)(8) to avoid capturing commercial LIDAR systems that are designed and intended for use in civil automotive applications.

If the intention is to capture “incoming” or detector bandwidth, we recommend that the limit be increased to 1000 MHz which would cover a standard LIDAR system designed for civil automotive applications. We also recommend that the element trigger be “greater than 256 elements.” Both of these changes would serve to encourage companies working in this space to continue to work on critical safety features.

> ***Cat. XII(b)(13) Laser stacked arrays as follows: (ii) Having an output wavelength exceeding 1,400 nm but less than 1,900 nm and a peak pulsed power density greater than 700 W/cm^2***

This control would potentially capture Laser stacked arrays that are intended to be incorporated into commercial LIDAR systems since the wavelength range 1400-1900 nm is being used for commercial applications.

Recommendation: We request that the same Civil Automotive Exception (with the amendment of extending the range to 400 m) that appears in the Note to paragraph (b)(6) be included in (b)(13)(ii) to avoid capturing commercial LIDAR systems that are intended for use in civil automotive applications.

> ***Cat. XII(c)(2) Photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm and not integrated into a permanent encapsulated sensor assembly, and detector elements therefor;***

Due to the extremely wide range of wavelength parameter, this sweeping control would potentially capture IRFPAs that are intended by design and function for use in commercial LIDAR systems used in self-driving cars. Such IRFPAs, including highly sophisticated arrays, are currently under the jurisdiction of the Commerce Department so this proposed control would have the effect of placing commercially world-wide available EAR-controlled IRFPAs under ITAR jurisdiction. This would not only have devastating effects on US businesses, but it will also serve to bolster foreign competitors' efforts in this space. Indeed, many companies may elect to move operations abroad and source commercially available non-US components to avoid the hugely negative impact of these controls.

With respect to the term "focal plane array" itself, it is unclear whether detector elements that are purchased separately on multiple chips but are ultimately put together on a plane would actually qualify as a "focal plane array."

Additionally, linear arrays (single line of detectors) can only form images when coupled to a scanning system, which makes them very inefficient for night vision applications, but are necessary to form the 360 degrees field of view that self-driving vehicles require.

Foreign availability: Many non-US companies have IRFPAs that would be caught by this control. For example, Hamamatsu, a Japanese company, has an array in the range of 900-1600 nm that would be caught.

Recommendation: Include an exception/carve out for IRFPAs that are specially designed and intended for use in LIDAR systems used in civil automotive applications and having a peak response within the wavelength range not exceeding 1800 nm. Also, we recommend amending the definition of an IRFPA to include the monolithic nature of it (and exclude arrays formed of multiple dies assembled together in a system) as well as exclude linear arrays.

> ***Note 1 to paragraph (c): A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) prevents direct access to the IRFPA, disassembly of the***

sensor assembly, and removal of the IRFPA without destruction or damage to the IRFPA.

§ 772.1 Definitions of terms as used in the Export Administration Regulations (EAR). Permanent encapsulated sensor assembly. (Cat 6) A permanent encapsulated sensor assembly (e.g. sealed enclosure, vacuum package) containing an infra-red focal plane array (IRFPA) that prevents direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA without destruction or damage to the IRFPA.

To our knowledge, the term "permanent encapsulated sensor assembly" is not an industry-wide used term. As such, using this term will inevitably lead to confusion as well as inconsistency in how it is applied when interpreting the related controls. Even with the definition provided in Note 1 to paragraph(c) as well as in sec. 772.1 of the EAR, it is hard to apply since the requirements of the definition in their strictest sense cannot be met. Specifically, as far as we are aware, many focal plane arrays that are in some sort of encapsulation can still be disassembled without damaging or destroying the IRFPA. However, this can generally only be done by specialized tools by someone who has detailed awareness of the design of the IRFPA. Is the term "permanent encapsulated sensor assembly" intended to capture closed and non-serviceable encapsulated systems that could be disassembled by a specialized technician using specialized tools without damaging or destroying the IRFPA or is it only intended to capture closed and non-serviceable encapsulated systems that cannot be disassembled without damaging or destroying the IRFPA? If the latter, it is unclear to us whether any assembly would actually meet that criteria.

Recommendation: If the technical data is already controlled and one would need the design technology in order to be able to disassemble the assembly without damaging or destroying the IRFPA, it makes sense to modify this note as well as the definition set forth in sec. 772.1 of the EAR to read as follows: "*A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) is designed as a closed and non-serviceable system intended to prevent direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA.*"

Note 1 to paragraph (f): Technical data and defense services directly related to image intensifier tubes and specially designed parts and components therefor controlled in paragraph (c)(1) of this category, infrared focal plane arrays (IRFPAs) and detector elements therefor controlled in paragraph (c)(2) of this category, integrated IRFPA dewar cooler assemblies (IDCAs) controlled in paragraph (c)(9) of this category, wafers incorporating IRFPA or ROIC structures controlled in paragraph (e)(3) of this category, and specially designed readout integrated circuits (ROICs) controlled in paragraphs (e)(4) and (5) of this category, remain subject to the ITAR even if the technical data or defense services could also apply to items subject to the EAR.

Note 1 to paragraph (f) has the potential to yield extremely unreasonable consequences. For example, if Manufacturer A is designing a focal plane array controlled under the EAR, the related design technology would be controlled under the EAR. If Manufacturer B takes that same technology though and designs an ITAR-controlled focal plane array, that design technology that was controlled under the EAR would now become controlled under the ITAR even though it may have nothing to do with the parameters triggering control of the focal plane array under the ITAR.

Recommendation: Both proposed Note 1 and Note 2 should be revised to make clear that technical data that is "directly related" to an ITAR-controlled item (covered by the mentioned controls in the Note) is limited to technology that is specific to the parameters that render the device controlled under the ITAR and would not include generic design technology for focal plane arrays that would be covered under the EAR.

The guidance provided in proposed Note 1 to paragraph (f) of USML Category XII indicates that technical data not "specially designed" for a defense article nonetheless is directly related to the defense article. Such an overly broad reach of "directly related" does not conform to the plain meaning of the term. If certain technical data apply equally to items subject to the EAR as to items subject to the ITAR, then the technical data necessarily, under the recently promulgated "specially designed" definition, are not "specially designed" for defense articles, and so should not be deemed "directly related" to any defense article. "Directly related" should not be taken to mean merely "capable of use with" since that would not only run contrary to the plain meaning of the term, but it would also defeat the definition of "specially designed. Both the State and Commerce Departments explicitly repudiated the "capable of" standard in their definition of "specially designed." That over-reaching standard should not be embedded in "directly related."

Furthermore a definition of "directly related" is needed in order to clarify the export control status of myriad technical data used in or with both defense articles and items subject to the EAR as well as with respect to software. A definition of "directly related" should be promulgated that adheres closely to the natural meaning of the words, *i.e.*, "required and peculiarly responsible for the controlled features" of the associated item. Both "required" and "peculiarly responsible" have commonly understood definitions among the exporting public and those commonly-understood definitions should apply in this context. Alternatively, those terms could be assigned meanings similar to those currently being proposed by both the Commerce Department and State Department in their proposed rules (June 3, 2015) revising certain key definitions within the EAR and the ITAR.

> ***§ 742.6 Regional stability. (a) * * * (8) Special worldwide RS license requirement for specified items controlled in Category 0 or 6. A license is required to export or reexport the following items to all destinations, including Canada: (i) ''Technology'' controlled under ECCN 0E987; (ii) All commodities controlled under ECCNs 6A002; (iii) All***

commodities controlled under ECCN 6A990; (iv) ''Software'' controlled under ECCN 6D002 for the ''use'' of commodities controlled under 6A002.b; (v) ''Software'' controlled under ECCN 6D003.c; (vi) ''Software'' controlled under ECCN 6D991 for the ''development,'' ''production,'' or ''use'' of commodities controlled under ECCNs 6A002, 6A003, or 6A990; (vii) ''Software'' controlled under ECCN 6D994; (viii) ''Technology'' controlled under ECCN 6E001 for the ''development'' of commodities controlled under 6A002 or 6A003; (ix) ''Technology'' controlled under ECCN 6E002 for the ''production'' of commodities controlled under 6A002 or 6A003; (x) ''Technology'' controlled under 6E990; and (xi) ''Technology'' controlled under ECCN 6E994.

This proposed regional stability reason for control imposes a worldwide licensing requirement for items classified under several ECCNs. Not only is this type of global control unprecedented under the EAR, but, in addition, it is being imposed on several items that were previously classified as EAR99 (e.g., those items covered under newly created ECCNs 6D994 and 6E994 as well as the additional items that will now be caught under the proposed re-wording of ECCN 6A990 which would expand its scope to include ROICs for *all focal plane arrays* controlled under 6A002a.3). In short, this means that items that previously required no license at all (except for export to the embargoed countries) will now require an export license to be shipped everywhere including Canada. Needless to say, this will result in a huge burden on industry as well as the Commerce Department, which will have to process both additional export/reexport and deemed export/deemed reexport license applications for the covered items. Since projects involving this type of technology and source code have not been thus far subject to restrictive export controls, it is highly likely that non-US nationals have already been working on them and continue to work on them today. It is also fairly common for collaboration on projects to occur across offices and across countries. The proposed control would require limiting cross-country collaboration, restricting those who can work on the projects to US nationals and/or obtaining licenses for all non-US nationals working on the project. Applying for export and deemed export licenses would impose a large burden on both the Commerce Department and industry, as described earlier, and raises other issues caused by a shift in licensing policy, described further below. It will also inevitably affect the marketability of US parts and components as well as software and technology.

(b) Licensing policy.—(1) Licensing policy for RS Column 1 items or items subject to worldwide RS control…(iv) Applications for exports or reexports of software or technology described in paragraphs (a)(8)(i), (a)(8)(iv), (a)(8)(v), (a)(8)(vi), (a)(8)(viii), and (a)(8)(x) will be reviewed with a presumption of denial. There is also a presumption of denial for technology described in paragraph (a)(8)(ix), unless it is ''build-to-print technology'' that is required for integration, mounting, inspection, testing, or quality assurance (e.g., necessary to meet International Standards Organization (ISO) certification), which will be reviewed on a case-by-case basis.

Under the proposed licensing policy for items subject to the RS worldwide control, many items that are currently EAR99 (items controlled under the proposed rewording of 6A990) in addition to numerous other items controlled under 6A002, 6D003.c, and 6E001 that were eligible for various license exceptions would now be subject to a licensing policy of denial. This shift in licensing policy, creation of a worldwide licensing requirement, and removal of eligibility of certain license exceptions serve to pseudo-treat these items as ITAR-controlled even though these items are actually currently controlled under the EAR. This would serve to potentially severely impact US industry as companies seek alternative options that would not be tainted by US export licensing policies in this space. Similar long-lasting repercussions were seen in the space and satellite industry when those areas were subjected to ITAR control and foreign companies then looked to suppliers outside the US (with some foreign companies specifically desiring to go "ITAR free") to avoid subjecting their products and technologies to control under the ITAR. In our view, this would not fall within the spirit of export control reform.

> ***6D991 ''Software,'' n.e.s., ''specially designed'' for the ''development'', ''production'', or ''use'' of commodities controlled by 6A002, 6A003, 6A990, 6A991, 6A996, 6A997, or 6A998.***

The proposed revision to 6D991 results in controlling software that is currently controlled as EAR99 (e.g., software “specially designed” for the “development,” “production,” or “use” of all 6A002 and 6A003 items). Furthermore, the reason for control of RS would result in a license being required for all covered software to all countries and non-US nationalities in the case of deemed exports. Again, controlling this type of software would be fairly disruptive to industry since much of this software is currently non-controlled. Moving from a state of non-control to a state of highly-controlled will inevitably result in large impact from a licensing perspective as well as from a cross-nationality and cross-country collaboration perspective. Finally, such a control will help further non-US business interests working in this space whose software and technology are not subject to unilateral US export controls.

> ***6D994 ''Software'', n.e.s., ''specially designed'' for the maintenance, repair, or overhaul of commodities controlled by 6A002, 6A003, or 6A990.***

> ***6E994 ''Technology'' ''required'' for the maintenance, repair, or overhaul of commodities controlled under 6A002, 6A003, or 6A990.***

The proposed creation of ECCNs 6D994 and 6E994 would result in controlling low-level software and technology that is currently non-controlled (i.e., EAR99) and already developed abroad by various non-US focal plane array manufacturers. Furthermore, the reason for control of RS would result in a license being required for all covered software and technology to all countries and non-US nationalities (in the case of deemed exports). Thus, we would move from a regulatory environment of not requiring any export or deemed export licenses (except for the embargoed countries) to one where licenses would be required for all covered items regardless of destination or nationality. Again, we believe this would create a significant burden on both US companies and BIS. Further, it would serve to ultimately hurt US businesses by having the secondary effect of encouraging the use of non-US manufacturers and developers so as to avoid the draconian implications that would result from using items that are subject to ITAR-like licensing requirements and policies.

Thank you once again for the opportunity to provide comments on these proposed rules.

Sincerely,

Ken Montgomery

RE: RIN 1400 AD 32 Public Comments on the Amendment to the International Traffic in Arms Regulations: Revision of the U.S. Munitions List Category XII.

Cordin has additional comments on how the ITAR proposed changes will negatively impact Cordin Company as business based in the USA.

Cordin Company has one strong competitor who sells in the US but systems are manufactured in the UK. This competitor is Specialized Imaging. They sell a SIM D intensified Gated CCD Camera very similar to our Cordin Model 222-4G gated intensified system and also a SIM X camera also a competitor. They also distribute Optronis image converter cameras in direct competition with the Cordin Model 164. The Specialized Imaging systems also compete with our Rotating Mirror Streak and framing cameras, Cordin Model 131 and Model 131-HD rotating mirror CCD streak cameras and Cordin Model 580 and Model 560 rotating mirror framing cameras. Specifications for these systems manufactured by Cordin and by Specialized imaging are included with this document.
As we mentioned before Cordin is shrinking in size and Specialized imaging located in the UK is growing. Specialized Imaging is not subject to the strict regulations already in force by the Commerce Department, nor will they be limited in the future by any of the proposed ITAR additional restrictions.

Cordin is directly affected by any changes in regulations relating to photocathode tubes, micro channel plate intensifiers that also contain photocathode tubes, focal plane arrays and optical components such as beam splitters and cooling devices or readout devices and software.

Some of the regulations will directly affect our Cordin systems now, but many of the others will affect us in the future. If this becomes law these components will be controlled and therefore a prohibiting problem for us in the future as our competitor will be allowed to use any of the controlled components without being regulated. These regulations will essentially not only cause us a problem in our current design but also by deciding what directions we will be allowed to pursue in the future. In a few years all the new technology you seek to control will no longer be cutting edge but it will still remain controlled by ITAR and we will have difficulty in using these items to improve our systems that must commercially sell in the US and outside of the US in order for us to compete with Specialized Imaging.

This is evidenced by the fact that the rotating mirror camera systems were designed in the 1940’s and detailed schematics of these systems are widely available worldwide. Numerous books were published in Europe detailing how to design and build a rotating mirror camera system. Our rotating mirror camera system basic design has now been known to the world for over 70 years and still it is on control. Once an item becomes mired in the Export Licensing system it is never removed regardless of its availability by other vendors outside of the USA. This policy has resulted in the fact that only one US company (Cordin) has been able to survive to the present in the USA when there were multiple companies that manufactured here in the 1950’s and 1960’s before the Export Licensing was instituted.

Specific regulations are written vaguely to allow coverage of various categories of imagers and parts to allow flexibility in your control of these items. This makes it very difficult for Cordin to determine what parts can be incorporated into our systems in the future.

The regulation Category XII (2) (A) sections 1-5. These could include almost anything we use to design our camera systems or that our competitor uses to design and we must make a similar design to compete with them in the commercial and military markets.

The regulation proposed Note to paragraph (b) (14) Sections (1) and (2). This may not apply immediately to technology but again future designs may require that we use these components with the increased spectral ranges or sensitivity. This paragraph will cripple our ability to innovate our image converter Model 164 and intensified gated cameras Model 222-4G and could also affect our our rotating mirror camera designs.

The regulation proposed Note to paragraph (c) (2) Section 12. This again is likely not included in our current camera systems, but again if we cannot use these components or assemblies in the future we are not able to keep up with the competition that is no similarly limited.

The regulation proposed Category XI (a) (4) This section in total will limit any improvements to our camera systems in the future buy limiting spectral ranges, cooling devices. The Model 131-HD rotating mirror streak camera will be captured on the ITAR regulation list because we combine the information on 11 CCD’s into one file. This regulation if instituted could, if interpreted strictly. put almost all of our existing camera systems on the ITAR program, if not now in the near future.

Again all the components that you are trying to regulate that are included in cameras that can be used in military operations are also of value in high speed streak and framing cameras. The high speed cameras we sell are already regulated as a dual use item, even this regulation is prohibiting as the out of the USA competition does not have this problem. Our cameras are used for research and are not of any value on a battlefield. If these cameras are caught in the ITAR regulations also we will be even more severely penalized to the point that we may not be able to continue our operation.

SIMX - Ultra High Speed Framing Camera

UNITED STATES
Choose Your Country

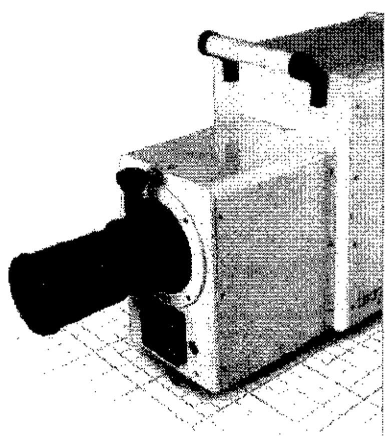
Overview

Using high resolution image intensifiers and no-compromise optical design, provides high quality ultra fast framing images.

High quality images free from lag or ghosting.

50lp/mm dynamic resolution

MULTI-SPECTRAL IMAGERY



The Specialised Imaging Ultra Fast Framing Cameras offer the ultimate in ultra-high-speed imaging performance to scientists and engineers across all disciplines. The all-new custom optical design offers up to 16 images without compromising shading, or parallax. High resolution intensified CCD sensors controlled by state-of-the-art electronics provide almost infinite control over gain and exposure to allow researchers the flexibility to capture even the most difficult phenomena.

Full remote control using Ethernet is offered as standard, either the integral viewfinder or a laptop computer can be used for local focus. Comprehensive triggering facilities, highly accurate timing control, and a wide range of output signals, coupled with a custom software package that includes full measurement and image enhancement functions simplifies image capture.

All SIM cameras can be configured to give up to 16 different multi-spectral images with an R, G and B filter on each channel. In this configuration it is possible to take 10 colour images and 2 monochrome.

Applications

- **Ballistics**
- **Combustion Research**
- **Failure Dynamics**
- **Elasticity, Crack Propagation and Shock resistance**
- **Medical Research and testing**
- **Detonics**
- **Impact Studies**

Features

- **NEW Multi-Spectral Imaging Functions**
- **Up to 16 discrete intensified optical channels**
- **Hybrid beamsplitter to overcome parallax and improve resolution**
- **Viewfinder focus**
- **Customisable spectral response**
- **1360(H) x 1024(V) 12 bit images**

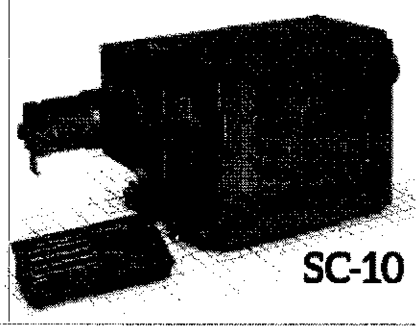
Model SC-10

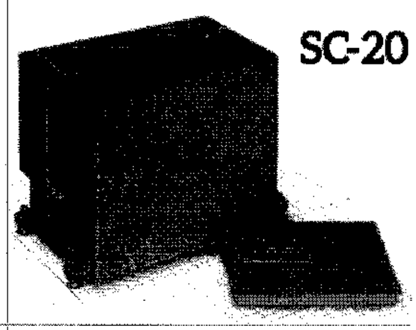
SC-10 offers time resolution down to < 2 picoseconds. It has a large 8 mm photocathode and a 20 mm long streak length making it one of the largest format picosecond streak cameras available.



The SC-10 offer a modular design to allow both UV and Visible optics. Single Shot and Synchroscan sweep modules cover time windows from 200 psec. to 100 ms. making the widest range system on the market. An externally mounted fiber coupled MCP Intensifier and a variety of CCD readout cameras offer sensitivity and resolution to give single photoelectron sensitivity and high speed data transfer. Input optics are available to allow coupling to all spectrographs for time resolved spectroscopy, to VISAR systems and other optical setups including microscopes.

Model SC-20

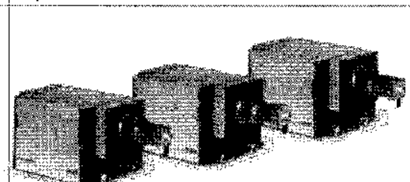
The SC-20 Streak Camera offers time resolution down to < 200 picoseconds. It has a large 35 mm photocathode and 40 mm streak lengths making it the largest format streak cameras available.



SC-20 offers a modular design to allow for UV or Visible inputs, both fiber optic and lens coupling, Single Shot sweep modules cover time windows from 100 nsec. to 100 ms. making it the widest range system on the market. An externally fiber optic coupled MCP Intensifier and a variety of CCD readout cameras offer resolution and sensitivity to give single photoelectron sensitivity and high speed data transfer. Input optics are available to allow coupling to most spectrographs for time resolution spectroscopy, to VISAR systems and other optical setups including microscopes.

Versatility

We offer several variants of the above camera systems to include X-ray, UV, VIS and NIR applications.



Both the SC-10 and SC-20 offer very high spatial resolution for multi line recording from Spectrographs, Line VISAR and other spatial resolution applications. SLR lenses can be mounted directly to the input optics for imaging events at long distances. Fiber Optic Coupled Time Markers allow for insertion of optical pulses to be superimposed on to the streak to allow post processing and calibration of the data. All cameras offer electro mechanical shutters to protect the photocathodes.

All systems offer photocathode gating to eliminate pre and post event light to improve signal to noise in your data. We offer the Highest resolution Readout Systems with up to 4K x 4K pixels at up to 16 bits dynamic range, and fiber coupling for maximum sensitivity. We offer Optically coupled CCD Readout System with up to 150 fps data transfer.

Model 580

HIGH SPEED ROTATING MIRROR CCD CAMERA

CORDIN

SCIENTIFIC IMAGING

HIGH SPEED ROTATING MIRROR CCD CAMERA

Model 580

- **Very high resolution:** 8 megapixel, (3.2K x 2.4k) at all capture speeds
- **High dynamic range:** 14 bit ADC
- **Very high framing rate:** 4 million fps
- **Very high image quality**
- **Software control:** easy control of exposure and timing parameters for each channel through user-friendly software
- **Image alignment software:** post processing software for precise alignment of images for animation and analysis
- **Laser and pulsed flash illumination synchronization**
- **Built-in time delay functions**

The **Cordin Model 580** high-speed rotating mirror CCD camera achieves the highest combination of speed and resolution of any imaging technology available. The Cordin 580 captures images in a burst mode at frame rates of 4 million frames per second and at 8 mega-pixel resolution. The system uses a rotating mirror optical system, which does not require reading out sub-arrays of the image to achieve higher framing rates. It also allows for much higher frame counts and no image degradation relative to MCP based high speed camera systems, and enables color imaging.
The ADC dynamic range for this camera system is a 14 bits and images are captured at full frame size 3.2K x 2.4K at all speed ranges. The camera is available in a 20, 40 or 78 frame configuration. Frames can be either black and white or color. Systems purchased with fewer frames can be upgraded to more frames at a later date.
The Model 580 camera can be triggered by the event being photographed, and can accept triggers in advance or for some time after the event of interest. It can also provide the trigger to initiate the event.
The standard high speed mirror-drive is driven by compressed air or nitrogen at lower to medium speeds, and with helium at higher speeds. The camera can also be configured with a brushless electric driven mirror operating at slower speeds, for more convenient operation when high framing rates are not required.
The system comes complete with a computer and control software. Post processing image alignment software that provides precise alignment of images for animation and analysis is also included. Data may be saved in a wide variety of 8 bit file formats. Full 14 bit images are saved in 16 bit tiff file format.

OPTIONS

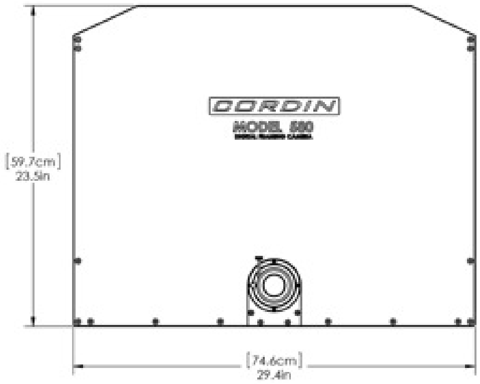
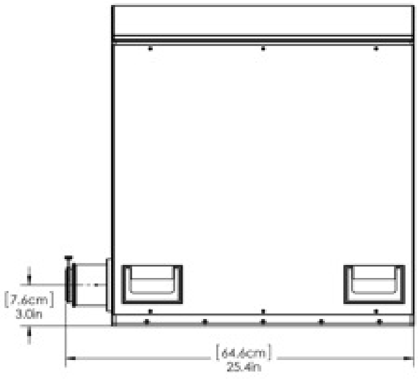
SPECIFICATIONS

Number of Frames	20, 40 or 78
Maximum Framing Rate	4 million fps (78 frames)
Front Optics	Single objective lens system (no parallax)
Objective Lens	Nikon F-mount
Resolution	3.2K x 2.4K pixels, 1.6K x 2.4K pixels with binning
Pixel size	5.5 x 5.5 µm
ADC Dynamic Range	14 Bit
Device Type	Full resolution progressive scan Black and white standard Color optional
Interface	Gigabit Ethernet for camera control and image transfer

CONFIGURATIONS

Number of Frames	20	40	78
Gas Turbine Drive Configuration			
Maximum Framing Rate (fps)	1,000,000	2,000,000	4,000,000
Minimum Interframe time	1 µs	500 ns	250 ns
Minimum Exposure Time	220 ns	220 ns	220 ns
Electric Drive Configuration			
Maximum Framing Rate (fps)	150,000	300,000	600,000
Minimum Interframe time	6.6µs	3.3 µsec	1.7 µsec
Minimum Exposure Time	1.46 µs	1.46 µs	1.46µs





Model 560

HIGH SPEED ROTATING MIRROR CCD CAMERA

CORDIN

SCIENTIFIC IMAGING

HIGH SPEED ROTATING MIRROR CCD CAMERA

Model 560

- **High resolution:** 2 megapixel, (1920 x 1080) at all capture speeds
- **High dynamic range:** 14 bit ADC
- **Very high framing rate:** 4 million fps
- **Very high image quality**
- **Software control:** easy control of exposure and timing parameters for each channel through user-friendly software
- **Image alignment software:** post processing software for precise alignment of images for animation and analysis
- **Laser and pulsed flash illumination synchronization**
- **Built-in time delay functions**

The **Cordin Model 560** high-speed rotating mirror CCD camera offers high resolution at extremely high framing rates, and at a moderate cost. The Cordin 560 captures images in a burst mode at frame rates of 4 million frames per second and at 2 mega-pixel resolution. The system uses a rotating mirror optical system, which does not require reading out sub-arrays of the image to achieve higher framing rates. It also allows for much higher frame counts and no image degradation relative to MCP based high speed camera systems, and enables color imaging.
The ADC dynamic range for this camera system is a 14 bits and images are captured at full frame size 3.2K x 2.4K at all speed ranges. The camera is available in a 20, 40 or 78 frame configuration. Frames can be either black and white or color. Systems purchased with fewer frames can be upgraded to more frames at a later date.
The Model 560 camera can be triggered by the event being photographed, and can accept triggers in advance or for some time after the event of interest. It can also provide the trigger to initiate the event.

Model 222-4G

HIGH SPEED GATED INTENSIFIED CCD CAMERA

CORDIN

SCIENTIFIC IMAGING

HIGH SPEED GATED INTENSIFIED CCD CAMERA

Model 222-4G

- **Very high image quality**
- **High resolution CCD,** 2K x 2K pixels, 12 bit dynamic range
- **Extremely short exposure time,** down to 5 ns
- **Very high sensitivity,** enabling very short exposures in moderate light or microscope configurations
- **Very high framing rate,** minimum interframe times equivalent to 200 million frames per second
- **Independent control of gain,** exposure time and time delay for each channel
- **Display adjustment** sliding scale to view 8 bit subsamples of full 12 bit images on the fly

The **Cordin Model 222-4G** gated, intensified multi-channel CCD camera offers the best image quality of any multi-channel intensified camera available. It is a powerful and easy to use tool for studying events in the nanosecond to millisecond time domain. The camera system is based around a beam splitter optical system that distributes the image from a single objective lens to eight separate imaging channels without vignetting, parallax or ghosting. Each channel has an MCP device fiber-optically coupled to a 4MPixel CCD, and can capture two images per channel, for a total of 16 images captured by the system.
Time between exposures on adjacent channels can be as short as five nanoseconds. Time between exposures on a single channel can be as short as one microsecond.
Operation of the camera is controlled via USB 2.0 with user-friendly software that allows the user to set timing, sequence, gain and triggering. 12 bit images can be saved as TIFF or RAW files, and any 8 bit subsampled image can be saved as BMP or JPG files. Camera settings can also be saved and reloaded later to duplicate a set-up.
The 222-4G is a thoroughly new design, building on Cordin's 15 years of experience in this technology.

OPTIONS

Microscope integration

Tele-focus macro objective lens

Alternate photocathode materials for choice of wavelength range sensitivity

UV configuration

Available with fewer channels at a lower cost, with option of adding channels later as an upgrade

Model 222-4G

HIGH SPEED GATED INTENSIFIED CCD CAMERA

CORDIN

SCIENTIFIC IMAGING

IMAGE CONVERTER STREAK CAMERA

Model 164

- **Wide photocathode,** 18mm x 4mm
- **High spatial resolution,** 30 lp/mm
- **High temporal resolution,** 50 picoseconds
- **Very low noise,** 10^{-8} Cd/m^{2}
- **High resolution readout,** 12 bit, 4 megapixel CCD

Streak cameras record a thin, wide line of light signals at the fastest possible speeds. They capture subtle variations in intensity from a line image, a spread spectrum, or linear array of discrete signals with resolution down into the picoseconds.

The **Cordin Model 164** streak camera is the evolution of Cordin's more than 20 years of experience in streak camera design and manufacturing. It uses a streak tube with a large photocathode and high spatial resolution to give a broad range of data capture capability. It has an integrated, high resolution, high dynamic range CCD readout that ensures all information is captured in both detail and gray scale.

The 164 comes standard with a photocathode offering spectral sensitivity from 350nm to 1100nm. Sensitivity ranges covering from 115nm to 1550nm are available.

The entrance slit is a user adjustable mechanical slit, so that resolution versus input energy can always be optimized. The input optics have an easily accessible telecentric region for drop-in filters.

The camera is controlled via a standard USB interface and a Windows PC. The host software allows for control of all camera functions, triggering and delays, image acquisition, display, and basic image analysis.

OPTIONS

Nikon lens mount for imaging

Spectrograph coupling for time resolved spectroscopy

Multi-channel fiber optic linear array input for optical signal analysis

Alternate photocathode materials for choice of wavelength range sensitivity

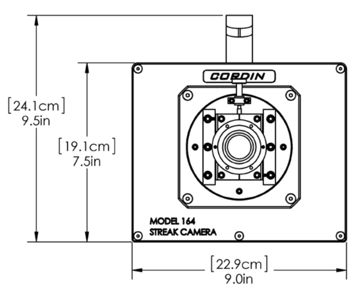
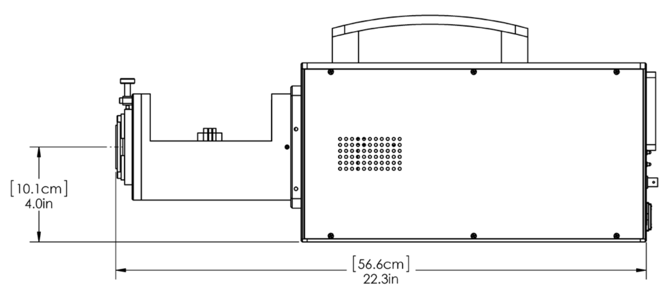
Power Input	110-250VAC 50-60 Hz
Weight	14 kg (32 lbs)





Model 131-HD

HIGH SPEED ROTATING MIRROR STREAK CAMERA

CORDIN

SCIENTIFIC IMAGING

HIGH SPEED ROTATING MIRROR STREAK CAMERA

Model 131-HD

- **Very high spatial resolution,** 6400 pixels
- **Fast temporal resolution,** down to 650 ps
- **Software control** of exposure and timing parameters
- **Laser and pulsed flash illumination synchronization**
- **Long record length,** up to 46,000 pixels
- **Re-triggerable within seconds**
- **14 bit image depth**
- **Programmable time delay functions**
- **Captures external electronic fiducial inputs** on common time base
- **Electronic shuttering** prevents image overwrite

The **Cordin Model 131-HD** camera is the ideal analytical tool for continuously measuring one dimension over time for a given event. The rotating mirror architecture provides long record length and recording rate flexibility. Combining rotating mirror and CCD technology provides users with access to digital streak image information in seconds. This allows the researcher to record data ready for subject adjustment, analysis, or presentation. A unique opto-mechanical design provides a continuous digital streak record, without gaps, blemishes, and with negligible distortion.

The Model 131-HD streak image is 6400 pixels in the spatial axis, and 17,000 pixels along the temporal axis. Optional extended record configurations offer up to 46,000 pixels on the temporal axis.

The Model 131-HD is offered with two alternative rotating mirror turbines: the standard 1209 turbine operates to 5,000 rps and the optional 1231 turbine operates to 7,500 rps. The turbines can reach 50% of full speed using compressed air or nitrogen. Helium is required to reach full speed.

The writing rate is determined by the speed of the rotating mirror, which is software controlled. At top speed, using the 1209 turbine the recording rate is 4,460 pixels per microsecond. The 1231 turbine at top speed yields a recording rate of 6,700 pixels per microsecond.

Two fiducial inputs are provided for precise image synchronization. Two programmable delayed outputs are also provided. An intuitive PC-based user interface allows for easy setup, acquisition, alignment, analysis and saving of data.

CORDIN
SCIENTIFIC IMAGING

HIGH SPEED ROTATING MIRROR STREAK CAMERA

Model 131

- **Very high spatial resolution,** 3,250 pixels
- **Fast temporal resolution,** down to 1.4 ns
- **Software control** of exposure and timing parameters
- **Laser and pulsed flash illumination synchronization**
- **Long record length,** up to 28,300 pixels
- **Re-triggerable within seconds**
- **14 bit image depth**
- **Programmable time delay functions**
- **Captures external electronic fiducial inputs** on common time base
- **Electronic shuttering** prevents image overwrite

The **Cordin Model 131** rotating mirror streak camera is the ideal analytical tool for continuously measuring one dimension over time for a given event. The rotating mirror architecture provides long record length and very high resolution compared to other streak capture methods. Combining rotating mirror and CCD technology provides users with access to digital streak image information in seconds. This allows the researcher to record data ready for subject adjustment, analysis, or presentation. A unique opto-mechanical design provides a continuous digital streak record, without gaps, blemishes, and with negligible distortion. Image information is captured at very fast rates without a photon-electron conversion. This means dynamic range is very high and image noise is very low.

The Model 131 streak image is 3,250 pixels in the spatial axis, and 14,000 pixels along the temporal axis. Optional extended record configurations offer up to 28,300 pixels on the temporal axis.

The Model 131 has large pixels at 7.4 micron pitch. This allows for better dynamic range, as the saturation threshold of the pixels is relatively high. The Model 131 is offered with two alternative rotating mirror turbines: the standard 1209 turbine operates to 5,000 rps and the optional 1231 turbine operates to 7,500 rps. The turbines can reach 50% of full speed using compressed air or nitrogen. Helium is required to reach full speed.

The writing rate is determined by the speed of the rotating mirror, which is software controlled. At top speed, using the 1209 turbine the recording rate is 1,700 pixels per microsecond. The 1231 turbine at top speed yields a recording rate of 2,500 pixels per microsecond.

Two fiducial inputs are provided for precise image synchronization. Two programmable delayed outputs are also provided. An intuitive PC-based user interface allows for easy setup, acquisition, alignment, analysis and saving of data.

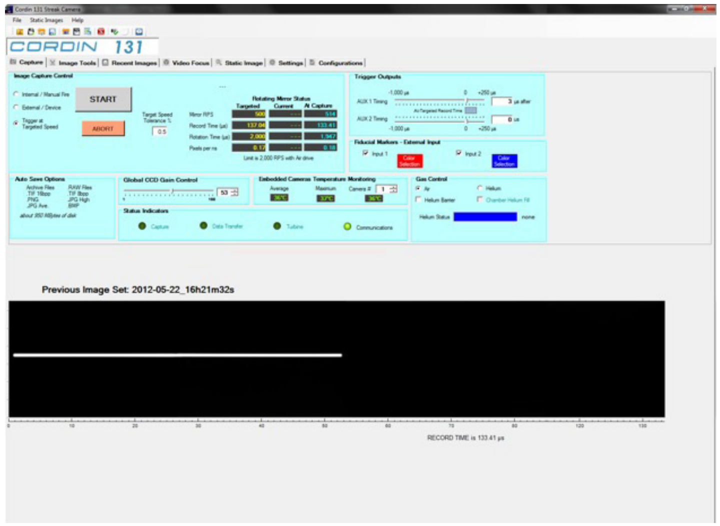
OPTIONS

Extended record length to 28,300 pixels
High speed turbine (Model 1231)
Optical fiducial mark generator
Custom objective optics
Custom slit configurations
Laser field of view alignment tool

CORDIN
SCIENTIFIC IMAGING

Model 131

HIGH SPEED ROTATING MIRROR STREAK CAMERA



Screen shot of the Model 131 user interface

SPECIFICATIONS

Record Width	3,250 pixels
Record Length	14,300 pixels standard
Extended Track Length	28,300 optional
Minimum Temporal Feature	3.4 pixels at 25 micron slit width
ADC Dynamic Range	14 bit
Radius of Image Arc	
Subtended Angle of Arc	
Objective Lens	Nikon F-mount standard Other objective optics available
Pixel Size	7.4 x 7.4 microns
Device Type	29 MPixel full resolution progressive scan Black and white standard
Data Interface	Gigabit Ethernet

Trigger Inputs	+5V, +5V isolated, analog and optical with threshold
Fiducial Inputs	Two independent channels captured on common time base
Delay Outputs	Two programmable delay channels on common time base

Turbine	MODEL 1209	MODEL 1231
Max Mirror Rotation	5000 rps	7500 rps
Temporal Resolution	2.0 ns	1.4 ns
Maximum Writing Rate	1,700 pix/µs	2,500 pix/µs

Washington, D.C. 20522

SUBJECT: ITAR Amendment—Category XII

Dear Sirs:

Systron Donner Inertial thanks the Department of State for the opportunity to submit comments for the above proposed rule. We support the Department's objective of establishing a positive United States Munitions List (USML). In response, we provide the following comments:

Paragraph (d) Guidance, navigation, and control systems and equipment:

Inertial sensor and systems nomenclature. We recommend that inertial sensor and systems nomenclature reflect designations in the EAR CCL Category 7: Accelerometers, Gyroscopes, Airborne INS, Land INS, Marine INS, IMU, and AHRS. Consistent nomenclature would be helpful to industry and the government in relating one classification to another and driving consistency among requirements.

Note to paragraph (d)(1). We recommend deleting "Note to paragraph (d)(1)" as well as removing and reserving USML Cat IV(h)(1), Cat VI(f)(4) & Cat III(c)(1). This would place controls for the same/similar technology for all guidance, navigation and control systems in XII(d) instead of multiple USML categories.

Note 1 to paragraph (d)(2). We recommend deleting "Note 1 to paragraph (d)(2)." All accelerometers (other than possibly Cat XV) should be controlled in this category.

Note 3 to paragraph (d)(2). We recommend clarifying the measurement of 'bias' and 'scale factor' to refer to one sigma standard deviation with respect to a fixed calibration over a period of one year.

Product line performance. We recommend that a note be added to clarify how the performance levels should be applied: are the performance levels applied against the product line or against each individual system produced in the product line. It is recommended that performance levels be applied against the product line; otherwise, there could be instances in which specific items from a product line would fall under USML CAT XII and other items from that product line would fall under EAR CCL Category 7. The product line could be expensive to produce if the license category is not definite before product completion for delivery.

Performance parameters.
We recommend the following performance parameters for USML Category XII:

Gyroscope: 0.0005 deg/√Hr

We recommend lowering the gyro Angle Random Walk performance value from 0.00125 deg/√Hr to 0.0005 deg/√Hr to better align the gyro with the accelerometer and INS performance values in Category XII. Angle Random Walk is clearly defined by the industry by using the Allan Variance technique.

INS:

Provide distinct performance parameters for INS configured for airborne, land and marine applications will make it easier for both industry and government to understand what is covered by Category XII:

Airborne INS	0.28 nmph CEP; at a 1 hour period
Land INS	0.28 mrad secant (Lat)
Marine INS	0.2 nm in 8 hour period, CEP

We recommend inserting a statement that INS performance is determined without position-aiding devices.

IMU:

Industry has two ways in which to describe IMU performance: the performance of the gyros and accels which make up the IMU, or as an equivalent INS performance expressed in nmph CEP. The proposed USML performance values would result in a bit of an asymmetry since the gyro performance levels are more consistent with an 0.8 nmph CEP performance. Changing to the proposed gyro performance would provide the proper balance.

Given the high performance parameters for inertial items in Category XII, we recommend removing USML paragraph entry XII(d)(1)(iii) and eliminating the “or 25 g” performance requirement. We assume that the objective of Category XII is to control inertial performance of strategic value while controlling the lower performance inertial items by the EAR CCL. The 25 g “or” condition will result in lower performance inertial systems remaining under USML.

<u>Paragraph *(f) Technical data and defense services:</u>

Notes 1, 2, & 3 to paragraph (f). We recommend the United States Government confirm their intent not to control any technical data or software which is not enumerated in these notes. As stated in the Supplementary Information of this proposed rule, these notes are revised to clearly describe the technical data and defense services controlled in paragraph (f). Note 2, paragraph A, enumerates what software and technical data are "included" in paragraph (f). It does not make any reference or enumerate any entries in paragraph (d); therefor as written, any technical data, including manufacturing know-how, of a USML accelerometer, gyroscope, or INS are no longer enumerated on the USML. If it is the intent of the United States Government to still control this data on the USML, we recommend a complete review of Notes 1, 2 & 3 to paragraph (f).

Category XII Title:
We recommend adding an additional clarifying comma to title; "Fire Control, Range Finder, Optical, and Guidance and Control Equipment"

We appreciate the opportunity to comment on the proposed rule.

Sincerely,

Dean Johnson
General Manager

DELPHI

July 6, 2015

Department of State
Submitted online via Federal Rulemaking Portal

Re: RIN 1400-AD32 Amendment to the International Traffic in Arms Regulations: Revision of US Munitions List Category XII

Dear Mr. Edward Peartree and others it concerns,

Delphi Automotive ("Delphi") is a leading global supplier of mobile electronics and transportation systems, including powertrain, safety, electrical/electronic architecture, controls and security systems.

Delphi's Electronics and Safety Division, is a leader and innovator in the design and manufacture of vehicular sensing systems (including LIDAR) for both Advanced Driver Assistance Systems (ADAS) and automated vehicular applications

Delphi has the following comments regarding the proposed rule changes:

Delphi appreciates the intent to recognize that certain LIDAR systems used in civil automotive applications be exempted from the export control restrictions as delineated in paragraph (b)(6):

Paragraph (b)(6) is added for certain light detection and ranging (LIDAR), laser detection and ranging (LADAR), or range-gated systems and includes a carve out for certain LIDAR systems for civil automotive applications.

Note to paragraph (b)(6): This paragraph does not control LIDAR systems or equipment for civil automotive applications having a range limited to 200 m or less

Delphi is concerned, however, that the 200m range restriction for automotive LIDARs places too strict of a limit both for ADAS applications that exist today and for future automated vehicle applications that may place higher requirements on sensor performance. Today, premium adaptive cruise control (ACC) systems for longitudinal vehicular control often require sensing ranges up to 250m in order to assure safe and proper vehicle control in scenarios where there is a large speed differential between host and target vehicles. Specifically, the 250m range requirement has typically been derived from an autobahn scenario where a very high delta velocity exists between a host vehicle (that may be traveling above 200km/h) and a much slower moving or stopped target vehicle, – and there is a need to sense the presence of the target vehicle at a long enough range to allow the system to (1) identify the target, (2) classify the target as a threat in the path and (3) actuate a safe level of braking (such as 0.3g) to bring the host vehicle to the required lower speed or to a stop. While LIDARs are not generally in use for such applications today, there is a strong likelihood that requirements for initial forward-looking automated vehicle applications would be identical and thus apply to LIDARs used in civil automotive applications.

DELPHI

Sensor requirements for higher levels of automated vehicle applications are yet to be defined, but Level 3 and Level 4 automated vehicle applications (as defined by NHTSA – those that allow the driver to be completely out of the loop for extended periods) require the vehicle to autonomously handle very complex scenarios. Sensor requirements for these applications are very likely to increase beyond the definition for ACC systems because the time required by the sensor to process and understand such a complex scene, evaluate options for vehicle action and take action or, if necessary, alert the driver to take over control of the vehicle because the situation cannot be safely handled in an automated manner, will increase. While it is not possible to say with certainty today what requirements would evolve to, it is possible to define a scenario where the ideal range requirement for a sensor could double to 500m to address very complex scenarios. Today, cost-effective technology that is capable of performing to these requirements is not available, but it is reasonable to expect that advancements will be made that may extend sensing range to support growing needs.

If comparable sensors are available in other countries without export restrictions, another potential consequence of this restriction is disproportionate harm to US companies from a competitive perspective. This could lead to loss of jobs and technical development expertise in the US.

Considering the above assessment, Delphi recommends that the range limit defining the exemption for LIDARs used in civil automotive applications be extended to at least 250m and that consideration be given to "future-proofing" the carve-out such that evolving needs in automotive applications are addressed. Such future-proofing action might include extending the range limit for civil automotive applications to 500m or more, or enabling a mechanism for speedy re-evaluation of range limits as automotive requirements evolve.

Please feel free to contact me with any questions. We would also be open to meeting to discuss if appropriate.

Sincerely,

Puneet Saxena

Subject:	Regulatory Change, USML Category XII.
Date:	Monday, May 04, 2015 7:15:22 PM

Hello.

I am trying to determine the effect the proposed new rulings would have on our company and products.

We are a US design and manufacturer (Arizona) of mobile LCD monitors that are installed in systems where NVG or similar mechanisms (Flir) are utilized; when built out a specific way, our products have NVIS-reading (filtering) capabilities. Per the Commodity Jurisdiction ruling of September, 2013, when our monitors are equipped with NVIS-filtering capabilities, we become ITAR-controlled under USML Category XII(c).

I have sent a similar inquiry to BIS, and aside from asking for a new Commodity Jurisdiction ruling (last on received 9-2013), I am trying to confirm that our product remains under USML Category XII or is it moved to BIS? And if it stays with USML, does the subcategory (c) change. I have read through the proposed changes, and Category XII(c) makes consistent references to radar systems versus NVIS-filtering. I am unclear what subcategory our product might be moved to, or is it now eliminated from ITAR-control and moved to EAR99 (BIS), when equipped with NVIS-filtering capabilities? Today, without the integration of NVIS-filtering capabilities per the September 2013 CJ, our product is EAR99.

Please advise. We ship this ITAR-controlled product ship out of the country, so have been applying for DSP-5 licenses through DDTC. We have an order with the destination to our US Military Bagram Airfield, in Afghanistan, and need to understand if the license application now goes through BIS or stays with DDTC.

I also am trying to get confirmation that we can ship ITAR-controlled (or EAR99 if that is where our NVIS-capable unit is moved) to the US Military Bagram Airfield, in Afghanistan.

And is there a possibility EAR99 shipped out of the US will require a license through BIS, not DDTC?

Thank you for your time.

Respectfully,
Meredith Downing

Subject: Response to the Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII - 80FR25821

Dear Mr. Peartree,

DRS Technologies, Inc. appreciates the opportunity to comment on proposed revisions to the ITAR related to USML Category XII, Fire Control, Range Finder, Optical and Guidance and Control Equipment. The rule proposes to control as military many items that are widely available outside the United States, in countries that all control them as commercial. These items comprise a portion of the U.S. high-technology industrial base including infrared, night vision, lasers, optics, and gyro-stabilized gimbals. Given the detrimental effect on the commercial space industrial base that the similar approach to control had, we have significant concerns regarding the negative impact that such controls will have on these industries.

We have attached to this letter our specific comments regarding the proposed rule along with a sampling of brochures of foreign available equivalent commercial items that are proposed for control by this rule. The following are our general comments.

One of the main tenets of the President's initiative to reform the U.S. export control system is to "place higher walls around fewer things" by controlling sophisticated military articles and technology, those sensitive military items that the U.S. has a technological lead in, while moving less sensitive items used by the military to the control of the Department of Commerce. The latter items are considered commercial/dual use technologies. Unfortunately, the proposed ECR changes to USML Category XII intend to control as military many infrared, laser, gimbals, and optics items that are commercial/dual use and available from world-wide sources in countries that already control these items as commercial.

For example, uncooled infrared focal plane arrays are presently manufactured by at least nine (9) companies operating in seven (7) countries outside the United States. Three (3) of these companies are located in China. All seven (7) of these countries control these items as commercial/dual-use items. The proposed rule change would restrict only the export of the products manufactured in the United States as these products would be designated military articles. Similarly, only US manufacturers of some high intensity lasers would be restricted from exporting their products while those lasers manufactured in several countries overseas -- all of which control these items as commercial products - would be able to sell them at will. Again, the proposed changes will severely impact any ability the U.S. has to compete in the global industrial and scientific laser market, effectively abandoning our competitive edge to companies in other countries.

These proposed rule changes, if issued, will have a seriously detrimental impact on the U.S. industrial base, effectively harming our national security rather than protecting it. In the 2012 joint Department of Defense and Department of State report to Congress regarding returning commercial satellites to the Commerce Department for export control purposes, the Departments stated that controlling such commercial world-wide available items as military was actually harmful to the national security interests of the United States. It had the unintended effect of weakening the U.S. industrial base while doing nothing to protect the critical technologies required of our military.

Yet, this proposed rule has the potential of repeating this same mistake. It will remove these segments of the U.S. industry from the global market, conceding this market to already established foreign companies, enabling them to grow unchallenged by any U.S. competition. Already strong, competitive companies such as Dali and Wuhan-Guide in China, Ulis and Sofradir in France, Selex in the UK, AIM, Rofin, and Jenoptik in Germany, Le Tehnika in Slovenia, Optec in Italy, SCD in Israel, Hamamatsu and NEC in Japan, Teledyne-Dalsa in Canada, and MikroSens in Turkey will continue to grow with the disappearance of U.S. industry from these well-established commercial markets.

We strongly urge a fundamental rewrite of this proposed rule to categorize these items as commercial items regulated by the Department of Commerce if such similar items are available outside the United States and are also controlled as commercial items. It makes no sense for the United States to control these items as military when similar items manufactured overseas are controlled as commercial. U.S. companies must have the ability to compete on a level footing against foreign competition.

Enabling the global competitiveness of U.S. companies will foster growth, investment in new technology, and strengthen the U.S. industrial base. That will help to ensure a continued stream of advanced technology remains available to our nation, enhancing national security. As evidenced in the commercial satellite field, controlling these items as this rule proposes will have the opposite effect by inhibiting U.S. industry in an already well-established and growing international field.

Should you have any questions in this matter or require additional information, please contact me at (703) 412-0288 or at ghill@drs.com.

Sincerely,

Gregory C. Hill
Vice President
Global Trade Compliance
DRS Technologies, Inc.

Attachments:
1. DRS Specific Comments
2. Sampling of Product Brochures.

Comments regarding specific entries.

1. Note to XII(b)(6), LIDAR and LADAR equipment. The Note to this entry excludes from its control LIDAR systems or equipment for civil automotive applications having a range of 200 meters or less. This means that such systems for civil automotive applications with a range greater than 200 meters will be controlled as defense articles.

The effective range in civil automotive applications is a safety issue. The further the LIDAR or LADAR system is effective, the more time the automotive system has to react. As such, the 200 meter range limitation reduces the safety of such systems in civil automotive applications.

Recommendation: Remove the 200 meter range limit such that the note will reflect that the entry will not control any such LIDAR or LADAR systems that are for civil automotive applications.

2. XII(b)(10), (11), (12), and (13)., tunable, non-tunable, and stacked array lasers. The concern with this entry is that it is absent any positive criteria other than wavelength and power output. Lasers are inherently dual use. The system they are integrated into should define the control, not the laser itself. Additionally, the proposed rule sets the positive criteria for ITAR control at levels well below already fielded international commercial products. For example, the cutoff power density of 3.3 kW/cm^2 is less than half of the foreign commercial availability of almost 8 kW/cm^2. High peak power lasers are available internationally through several international companies. As written, these entries will severely impact any ability the U.S. has to compete in the global industrial and scientific laser market, leaving it to Rofin, Trumpf, and Jenoptik of Germany, who are already market leaders.

Recommendation: Delete XII(b)(10), (11), (12), and (13)

3. XII(c)(2) through (13), infrared focal plane arrays, gimbals, and cryo-coolers.

a. XII(c)(2), un-encapsulated photon detector & microbolometer IRFPAs

b. XII(c)(3), encapsulated One-dimensional photon detector IRFPAs with greater than 640 elements

c. XII(c)(4), encapsulated 2-dimensional photon detector IRFPAs with greater than 256 elements

d. XII(c)(5), encapsulated microbolometer IRFPAs with greater than 328K elements.

e. XII(c)(6), multi-spectral IRFPAs.

f. XII(c)(7) & (8), charge multiplication FPAs.

e. XII(c)(9), integrated dewar cooler assemblies

f. XII(c)(10) & (11), gimbals with 2 or more axes of stabilization better than 200 and 100 micro radians respectively.

g. XII(c)(12), infrared imaging cores

h. XII(c)(13), Binoculars, binoculars, monoculars, etc.

Recommendation: The above entries should be deleted in their entirety. The items they intend to capture as military currently are available from many international sources in countries that all control these items as commercial.

The below lists provide an illustration of the foreign commercial availability of these items. For example, XII(c)(2) proposes to control as military all un-encapsulated microbolometer focal plane arrays. The non-US uncooled infrared detector manufacturers list contains the names of nine (9) companies located in seven (7) countries that design and manufacture these items. All seven (7) countries control these items as commercial/dual-use for exports.

A second example is XII(c)(11) which proposes to control all gimbals with a stabilization better than 100 micro radians as military. The Yiwu TianYing Optical Instrument Company in China sells commercial gimbals with a stabilization of 40 micro radians. These gimbals also contain a 640x512 cooled infrared camera, another item this rule proposes to control as military.

The below lists are by no means complete. The commercial availability is so widespread, there was insufficient time to compile it all. The purpose of these lists is to provide an example of the world-wide commercial availability of most of the items proposed for military control in XII(c).

Additionally, we have attached a sampling of brochures of foreign available equivalent commercial items that are proposed for control here.

<u>Non-US uncooled infrared detector manufacturers:</u>

- Ulis, France, uncooled infrared focal plane arrays up through 1024x768, commercial.
- Semi-Conductor Devices (SCD), Israel, uncooled infrared focal plane arrays up through 640x480, commercial
- NEC Avio Infrared Technologies Co. Ltd., Japan, uncooled infrared focal plane arrays up through 640x480, incorporated into their own commercial IR camera cores and camera systems, commercial
- Wuhan-Guide, China, http://wuhan-guide.com uncooled infrared focal plane arrays up through 640x480, commercial (non-Wassenaar member)
- Zhejiang Dali Technology Co., China, www.ir-thermalimagingcamera.com, uncooled infrared focal plane arrays up through 640 x 480, commercial (non-Wassenaar member)
- Debut Optoelectric Sensor Co, Ltd, China, uncooled infrared focal plane arrays up through 640x480, commercial, (non-Wassenaar member)

- Fraunhofer IMS, Germany, www.ims.fraunhofer.de, uncooled infrared focal plane arrays up through 320x240, commercial
- MikroSens, Turkey, www.mikrosens.com.tr, uncooled focal plane arrays up through 160x120, commercial
- Teledyne-Dalsa, Canada, uncooled infrared focal plane arrays up through 640x480, commercial

Non-US cooled infrared detector manufacturers and products:

- Selex, UK, www.selex-es.com, cooled infrared focal plane arrays up through 1024x768, commercial
- Sofradir, France, www.sofradir.com, cooled infrared focal plane arrays up through 640x512
- Semi-Conductor Devices (SCD), Israel, www.scd.co.il, cooled infrared focal plane arrays up through 1920x1536 (10 micron, mid-wave InSb), commercial.
- Xenics, Belgium, 640 x 512 InGaAs SWIR FPAs, commercial (also designs its own ROICs)

4. XII(c)(16)(iii). This entry lists fixed-site reconnaissance, surveillance, and perimeter security missions as the positive criteria. These are not unique to the military and have broad commercial security applications.

Recommendation: Delete entry.

5. XII(c)(18), near-to-eye display systems. This entry intends to control what amounts to a TV screen.

Recommendation: Delete the entry.

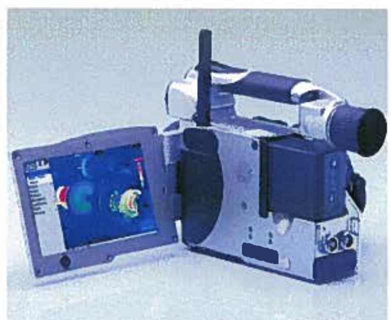
6. XII(e)(3) through (10) and (12) through (14) Wafers, ROICs, Vacuum packages, Integrated Dewar Cooler Assemblies, Cryocoolers, cryostats, infrared lenses, image processing electronics, near-to-eye displays, IR scene projectors.

Recommendation: These entries should be deleted. See the above lists for the wide-spread foreign commercial availability of these commercial items.

JENOPTIK

VarioCAM® HD Thermographic Infrared Cameras

Precision Thermography with up to 2048 × 1536 IR Pixels Resolution



High Definition Infrared made in Germany: Thermographic precision you can rely on.

If demanding thermal imaging is your assignment, the new VarioCAM® HD uncooled thermographic cameras will be your first choice solution.

VarioCAM® HD outputs crisp and most detailed radiometric images of **up to 2048 × 1536 pixel** spatial resolution enabled by Jenoptik's ***Resolution Enhancement technology*** and offers a thermal resolution of **50 mK NETD**. Operating at a frame rate of up to 30 Hz, the camera provides a **real-time** image resolution of **1024 x 768 pixel**.

VarioCAM® HD is the world's first thermography camera featuring a built-in **laser rangefinder** for optimal temperature correction, autofocus support and precise geo-referencing in connection with the **built-in GPS** module. For immediate image control the camera offers a robust and extra-large **1280×800 pixel 5.6" TFT display** and an tiltable viewfinder. Versatile industry-proof standard interface options, including wireless and GigE-Vision allow for easy remote imaging.

Matching a broad variety of thermal imaging applications, a **great choice of high quality infrared optics** is available – of course, also made in Germany, manufactured by Jenoptik.

Applications:

- Industrial and scientific research & development
- Predictive and preventive maintenance
- Building inspection

Sensor Systems

VarioCAM® HD Thermographic Infrared Cameras

UMTI Portable Surveillance Thermal Camera 160x120

FOB Price: To be determined

Introduction: Light weight monocular surveillance camera

Contact Supplier

Specifications

Portable Design, easy to operate
Build-in video-recording system (MP4 format)
General purpose rechargeable battery (Lithium Battery)
MIL-STD-810 standard encapsulation for harsh environments

Thermal Vision	
Detector Type	UFPA
Detector Scale	384×288
Spectral Range	8~14 um
NETD	≤80mk
FOV	12°x9°
Focus Range	10m~∞
Digital Zoom	2x
System Feature	
Control Mode	Control Key
Brightness/Contrast Control	Manual/Auto
Image Output Mode	View Finder/Video output
Storage	~20,000 images~1 hour video (with 2G storage spac e)
Viewfinder	High-resolution Gray Scale OLED, monocular
Video Output	PAL(or NTSC)
Power Supply	Li-Ion Rechargeable battery
Rated Voltage	7.2V
Power Consumption	<4W
Battery Operation Time	>3 hr
Start-up Time	<20s
Dimensions	188x94x80mm
Weight	650 g
Detection Range	
Human/meter	1125
Vehicle/meter	3450
Identify Range	
Human/meter	112

Vehicle/meter	345
Encapsulation	
Mil-spec	MIL-STD-810

HDR-IR High Dynamic Range IR Camera

The HDR-IR high dynamic range infrared camera series includes high performance cameras which cover extended scene temperature ranges.

These cameras maximize camera sensitivity automatically for any static or dynamic scenes. They find the best exposure time according to the scene and allow to resolve targets up to 2500°C.

Key Benefits

- Ultra-high dyanmic range ensure observation of scene targets with extremely high contrast and acc
- Real-time radiometric or uniformity corrected images
- Patent black body free correction technique
- Thermal sensitivity allows to detect temperature différences as small as 20 mK

Detailed Product Description

Auto / Manual IP67 Thermal Imaging Binocular For Hunting / Marine Navigation

Quick Detail:

Place of Origin: Zhejiang, China (Mainland)
Brand Name: DALI
Model Number: S750M
Usage: Security
Theory: Infrared Thermometer
Detector type: Un-cooled FPA micro-bolometer
Array size: 384X288
Lens option: 61mm, Auto focus
Thermal sensitivity: ≤0.08°C@30°C
Frame frequency: 50Hz
Focus: auto/manual
Zoom: X2
Spectral range: 8-14um
Encapsulation: IP67
Photo and Record
GPS electronic compass
Laser range finder

Description:

S750M is portable, handheld thermal imaging binocular observation equipment for day and night searching and observation, has photo and record functions. With features of anti-shock and vibration, enjoys wide operating temperature range and other characteristics, used in the fields of night vision observation and surveillance, security smuggling, criminal investigation, search and rescue and other fields.

Applications:

Marine navigation
Personal security
Border surveillance
Hunting
Law enforcement

Technical specification

Items		S750M
Detector	Detector type	Uncooled FPA microbolometer
	Spectral range	8 ~ 14 μm
	Array size	384×288
	Pixel size	25μm
Machine Characteristics	NETD	≤80mk@30℃
Lens	Lens	61mm/F0.8
	Fov	9.0°×6.75°(±5%)
	Brightness enhancement	Auto/Manual
	Image enhancement	Yes
	Filtering	Yes

Information Machine	Laser range finder	Working band	1.55 μm(safe for human eye)
		Distance	20m~2Km
		Accuracy	≤2m
		Range	≤30m
		Success Rate	≥96%
		Working frequency	3/minute(urgency 10/minute)
	Target location accuracy	±2m(within1Km), ±5m(1Km-2Km)	
Environment	Operating temp	-20℃~+50℃(Standard)	
		-40℃~+60℃(Specially Made)	
	Storage temp	-40℃~+60℃(Standard)	
		-40℃~+65℃(Specially Made)	
	Encapsulation	IP67	
Power System	Battery type	Li-Ion, rechargeable	
	Battery operating time	3 hours continuous working,range detection of 100 times(at normal temperature)

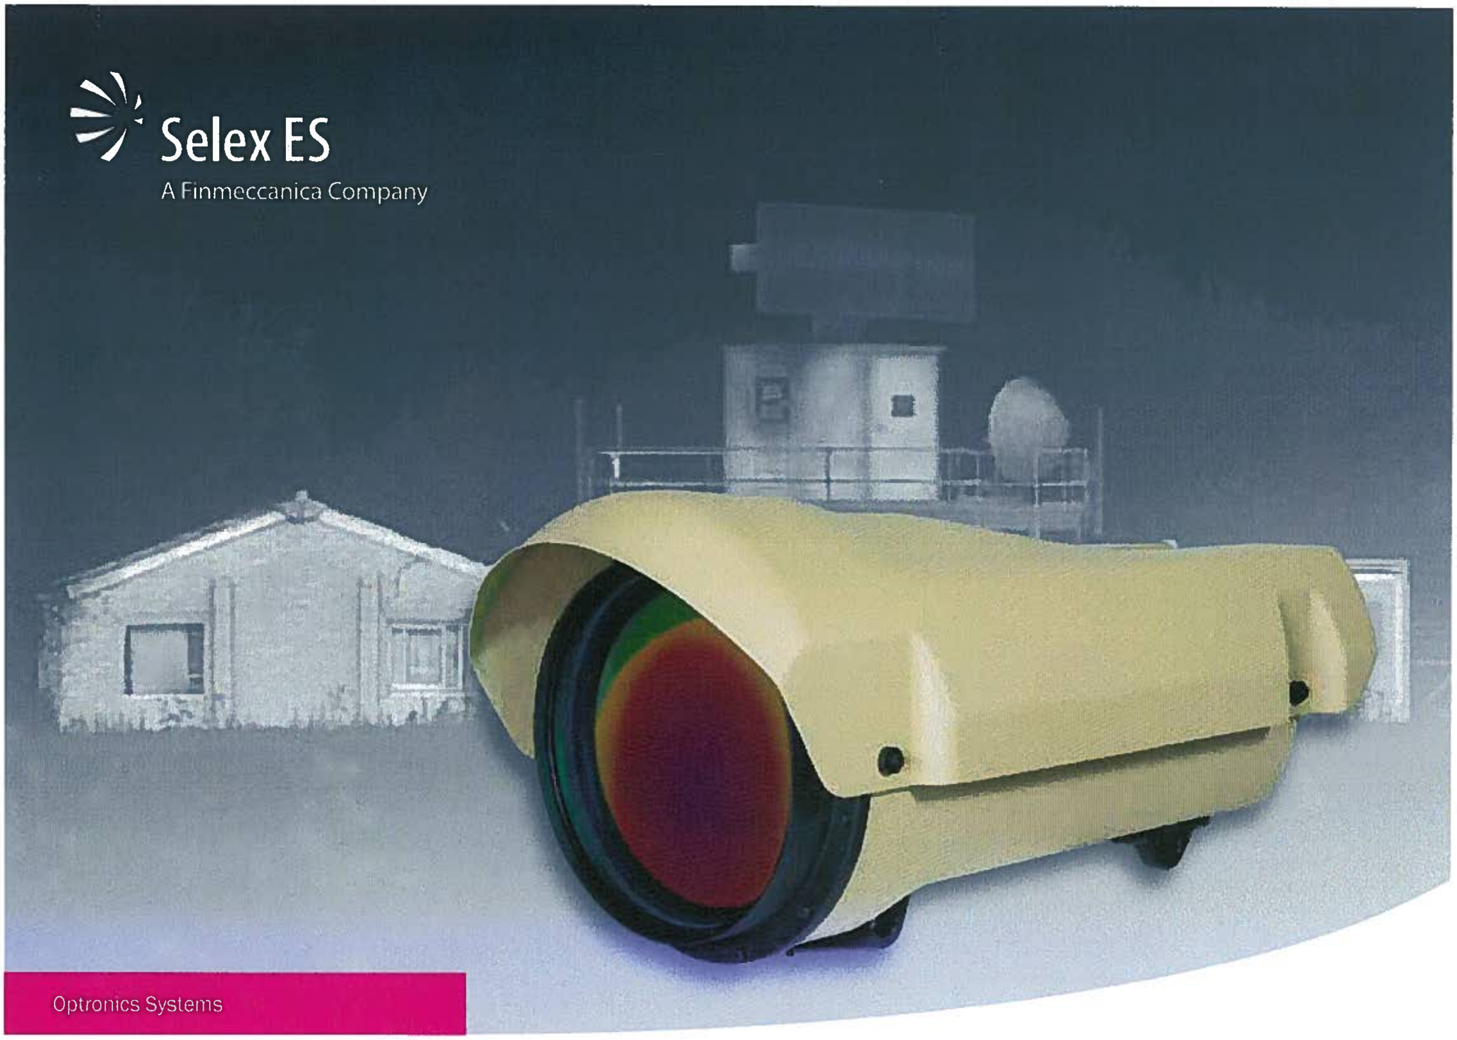
China good quality IR Thermal Imaging Camera supplier.



HORIZON SD/HD
THERMAL IMAGING CAMERA

The Horizon Medium Wave Infra-Red (MWIR) thermal imaging camera employs the latest focal plane array technology to meet long-range surveillance and target identification requirements.

Utilising a modular Integrated Detector Cooler Assembly, the camera is fitted with either Standard Definition (SD) or High Definition (HD) detector arrays. This design allows for rapid assembly and ease of maintenance.

Horizon HD provides a wider Field of View (FoV) for greater Situational Awareness, whilst delivering a narrower IFoV for longer range target identification and engagement.
Horizon cameras have been specifically designed with very long life cooling engines of 50,000 hours. This increases reliability and reduces through-life costs.

KEY BENEFITS

- Designed, developed and manufactured in the UK
- 'Dual Use' rated
- Very low through-life cost - 50,000 hours cooling engine life
- Ease of integration – video and communication over Ethernet
- Multiple digital and analogue video outputs
- ONVIF control and video interface
- Latest image processing
  - Turbulence mitigation
  - Image stabilisation
  - Local area contrast enhancement
- Ultra narrow field of view: 0.6°
- Qualified to operate from -40°C to +55°C
- Extended warranty options
- Finance options available
- Service provision contracts options

The Camera that Sees Further than You Can

TECHNICAL SPECIFICATION

Detector array resolution	640 x 512 (SD), 1280 x 720 (HD)
Detector pitch	16μm (SD), 12μm (HD)
FOV	7.3 x 5.9 degrees to 0.6 x 0.5 degrees (SD) 11.0 x 6.2 degrees to 0.9 x 0.5 degrees (HD)
Detector technology	CMT
Band	3.7μm - 4.95μm
F/Number	F/4
Focal length of continuous optical zoom	80-960mm
Comms	RS-422 Ethernet
Analogue video output	NTSC PAL (CCIR) HDTV 720p
Digital video output	HD-SDI Ethernet (H264, ONVIF)
Operating temperature	-40°C to 55°C
Weight	23kg
Size (L x W x H)	596.5mm x 299mm x 299mm
Power source	28VDC (18-32V)
Nominal power at steady state	<25W
Dynamic range enhancement	LACE Linear Edge enhancement
Image stabilisation	Yes
Turbulence mitigation	Yes
Auto focus	Yes
Cooling engine	Long life linear (50,000hrs)
Non-uniformity corrector	Built-in reference and quadratic NUC
E-Zoom	Interpolated (up to 8x)

Detailed Product Description

Cooled Long Distance Fixed Thermal Imaging Camera For CCTV Surveillance

Quick Detail:

- ◆ 600mm focal length, ultra long-range observation distance
- ◆ 15KM vehicle/30KM medium vessel security detection
- ◆ Triple FOV, meets the different requirement of detection ,recognition, identification
- ◆ FOV switch time <1S
- ◆ Digital Detail Enhancement(DDE)
- ◆ Multiple user defined auto mode , meets different targets observation require ment in different environment.
- ◆ RS422 remote control
- ◆ Rugged housing,compact structure,high protection encapsulation(IP67)

Applications:

Suitable for border, maritime, ports and islands where require day and night security surveillance.

Technical specification:

Item		**Specification**	
Detector	Detector type	HgTeCd Cooled FPA detector	
	Array size/format	320×256	640×512
	Pixel pitch	30μm	15μm
Image characteristics	Field of view(FOV)	WFOV: 11°×8.8° MFOV: 2.2°×1.76° NFOV: 0.92°×0.73°	
	Focal length	50/250/600mm	
	Spatial resolution	WFOV:0.6mrad MFOV 0.12 mrad NFOV 0.05mrad	
	FOV switch time	≤1s	
	NETD	≤35mk@30℃,F4	
	Frame frequency	50Hz	
	Focus	Auto/Electrical manual focus	
	Spectral range	3.7~4.8μm	
Thermal operation	Starting time	<8min(In normal temperature 25 degrees)	
	Brightness/gain adjustment	manual brightness/gain adjustment; auto brightness/gain adjustment	
	auto brightness/gain configuration adjustment	2 fix pattern,8 user defined setting pattern	
	Polarity reversal	Black hot/White hot	
	Zoom	2x	
	Noise reduction	Yes	
	DDE	Yes	
	Calibration	Automatic and manual calibration	
	Crosshair	Display/Hidden	
Power system	External power supply	24±3V DC	
	Power consumption	<14W(In normal temperature 25℃ normal work)	
Environment	Operating temperature	-40℃~ +55℃	
	Storage temperature	-45℃~+65℃	
	Encapsulation	IP67	
Physical	Weight	≤7Kg

Detailed Product Description

Manual Portable Thermal Imaging Module , 640X480 Thermal Camera Module

Quick Detail:

Place of Origin: Zhejiang, China (Mainland)
Brand Name: DALI
Model Number: D880
Usage: Security
Theory: Infrared Thermometer
Detector type: Un-cooled FPA micro-bolometer
Array size: 640X480
Pixel size:17μm
Thermal sensitivity: ≤60mK(f/1,300K,25-50Hz)
Temp control: TEC
Digital zoom: 2X,3X,4X
Power consumption: ≤2W(normal atmospheric temp)
Frame frequency: 50Hz

Description:

DALI detector contributes to high price & performance ratio
Small size & Low weight, multiple interface, easy for your integration
High resolution, good image quality
Low consumption for longer continuation
Pseudo color optional for your easy observation
Low and wide voltage power supply,0.5V~5V
Wide operational temperature extended to -40℃~ +60℃

Applications:

Marine navigation
Personal security
Border surveillance
Hunting
Law enforcement

Technical specification:

		D840
Detector characteristics	Detector type	Uncooled FPA microbolometer
	Array size	640X480
	Pixel	17um
	Spectral range	8~14um
	Temp control	TEC
	NETD	≤60mK(f/1,300K,25-50Hz)
	Thermal time constant	≤5ms
	Frame rate	50Hz
	Display resolution	640x480

Environment	Operation temperature	-15℃~ +50℃ (Can expanded to -40℃~ +60℃)
	Storage temperature	-40℃~ +70℃
	Humidity	5~95%,Non condensing
physical characteristics	Size(mm)	W40mm× H41mm× D35mm
	Weight	≤76g(including housing,shutter)
	Lens mount interface	M34×0.75 ;screw thread
	Mechanical interface	2×M3(four sides);screw hole
	Electrical connector	26 pins connector(including cable)

Competitive Advantage:

◆ Extremely compact and extremely light
◆ Image capture and recording

High Resolution Uncooled Infrared Detectors With Completely Independent Core Technology , 640*480

Detailed Product Description

High Resolution Uncooled Infrared Detectors With Completely Independent Core Technology , 640*480

Quick Detail:

Place of Origin: Zhejiang, China (Mainland) Brand Name: DALI
Model Number: DLC640/DLD640
Usage: Security
Detector type: Un-cooled FPA micro-bolometer
Array size: 640X480 Pixel pitch: 25um/17um
Spectral range: 8-14um Frame frequency: 25~50Hz
Thermal sensitivity: ≤60mk@(f/1;300k)

Description:

The Uncooled Microbolometer infrared FPA detector researched and developed by Dali has already been applied in industrial production. It has the advantages of high resolution, high sensitivity, low fixed pattern noise and fast response.Detector is manufactured in Standard MIL STD810/813, applicable to different industry.

Specifications:

Item	DLC640/DLD640 (25μm / 17μm)
Material	amorphous silicon
Array size	640×480
Pixel pitch	25μm / 17μm
Fill factor	≥60%
Spectral range	8-14μm
Temperature control	TEC
Frame rate	25Hz single / 50Hz double end
NETD	≤60mK(f/1,300K,25-50Hz)
Thermal time constant	≤5ms
Responsivity	≥8mV/K
Operability	≥99%
Power supply	5V
Power consumption	≤300mW(excluding TEC)
Output	single / double end
Dimension	32mm×23.5mm×7.6mm(pin is not included)
Weight	≤20g
Operating temperature	-40°C - +60°C
Storage temperature	-40°C - +85°C
Standards	MIL-STD-810 and -883

Competitive Advantage:

- Different resolution
- Short integral time
- Stable performance in temperature range -40℃ to +60℃
- Extremely low thermal noise
- Excellent nonuniformity

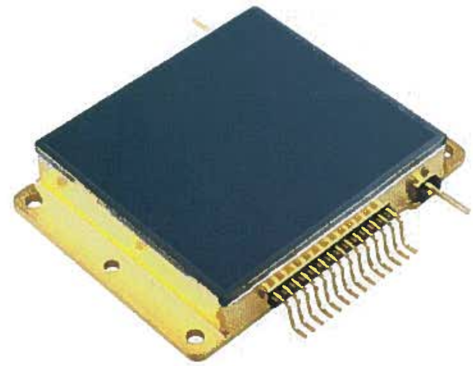
High performance, high definition infrared imaging



PERFORMANCE

- NETD < 50 mK (F/1, 300K, 30Hz)
- Frame rate up to 120Hz
- Typical array operability > 99.9%
- Low power consumption < 210 mW
- Extended operating temperature range: - 40 °C to + 85 °C
- Standards: MIL-STD-810 and -883
- Over exposure / Sun safe

FEATURES

- Material: resistive amorphous silicon
- Spectral response: 8 - 14 µm
- Readout configuration driven by serial link
- Overall dimension (mm): 41.2 x 30 x 6.6 pin out excluded
- Weight < 30 g
- Easy TEC-less implementation

- **High resolution, high contrast imaging for long range detection**
- **Robust for extreme environments (e.g. TWS, RWS, situation awareness, UGS)**
- **Detects fast moving objects**
- **Reduced calibration time**
- **24/7 surveillance capable**
- **Footprint compatible with UL05251-026**

Description **Additional Information**

Reviews (0)

Product Description

From our offices in Canada and Taiwan R.O.C. (Republic of China) we offer uncooled IR imaging modules from 8 to 12 microns.

These sensors are highly responsive and have been adapted for a wide range of applications. The sensor can be purchased either on it's own or with a multitude of different lenses.

The high frame rate output (60Hz @ NTSC or 50Hz @ PAL) enables greater image quality for a wide range of applications than does that of other companies' models.

32 bit SDK available.

We offer the following modules:

- Uncooled Thermal Module(640×480)
- Uncooled Thermal Module(384×288)
- Uncooled Thermal Module(160×120)

The camera cores vary in size enabling the customer to choose the most suitable type according to their own requirements.

Compact, light and tiny
The camera core is about 50g (not including lens) and exceptionally small facilitating target integration.

Control functions
Parameters, including brightness, contrast, auto-gain can be set by the user. The customer can also establish parameters via the RS232 interface.

Digital zoom
Our camera core has 2X/4X zoom function. Digital zoom will be of great help when the target is too small to identify.

NTSC & PAL video output
We supply PAL or NTSC, 16-bit parallel digital signal or analog signal. Video format must be specified at time of order.

Contact Us for more details or to get an official quote.

Specifications

Type	ASP-HR160	ASP-HR320	ASP-HR640
	Imaging Performance		
Detector Type	FPA, Uncooled Microbolometer		
Resolution	160 x 120	384 x 288	640 x 480
Spectral Range	8-14 um		
Thermal Sensitivity	80mK @ 300K	50mK @ 300K	60mK @ 300K
Field of View	Lenses are optional, FOV varies according to different lenses		
Focus	Manual/Automatic		
Image Frequency	60 Hz @ NTSC or 50 Hz @ PAL		
	Image Presentation		
Video Output	PAL or NTSC, 14-bit parallel digital signal or analog signal. Video format must be specified at time of order.		
	Power		
Working Voltage	DC 7 – 12 V		

Power Consumption	< 2W	<2.5 W	< 3 W
	Environmental Specifications		
Operating Temperature Range	-40°C to 60°C		
Storage Temperature Range	-40°C to 70°C		
Humidity	<95%, non-condensing		
	Physical Characteristics (without lens, core only)		
Size (L x W x H)	40 mm x 40 mm x 30 mm		45 mm x 45 mm x 37 mm
Weight	50g		
	Interface		
RS232	Command and Control Functions		

Applications:

- Thermology
- Thermal Imaging for Automation
- Night Vision
- Surveillance
- Security of Nuclear Plan
- Law Enforcement
- Infrared Camera for Building Diagnostics
- Automotive Night Vision
- Aviation and Maritime Enhance Vision
- Electrical and Mechanical Thermal Imaging
- Thermal Imaging for Gas Detection
- Furnace and Boiler Inspection
- Medical/Biology
- Maritime
- Power plants
- Metal Production
- Petrochemicals

WDR InGaAs Product Range

Description

For laser measurements, high temperature thermography, Coastal surveillance, bio medical imaging, waste sorting...

NIT introduces his new **WDR InGaAs products family**, including **sensors and camera modules**.

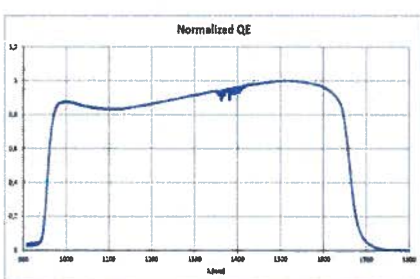
NIT Short Wave Infrared (SWIR) products are based on a proprietary **Wide Dynamic Range ROIC technologies** and offer a **Dynamic Range (DR) of more than 140dB in a single image without any external control.**

The internal Fixed Pattern Noise correction gives a **high uniformity pcitures in all light conditions** with no need of Look-up table.

The NIT WDR InGaAs sensors use **InGaAs photodiodes array** operating **from 900nm up to 1700nm** with a high QE and coupled to a patented Read Out Circuit (ROIC).

The camera modules, WiDy SWIR family, offer different interfaces compatibility with an exterme ease of use :

- The **digital version** are delivered with a full Software development kit (SDK), WiDy View, operating under Microsoft Windows.
- The **analog version** gives direct SWIR video flux through composite connection.



Spectral response

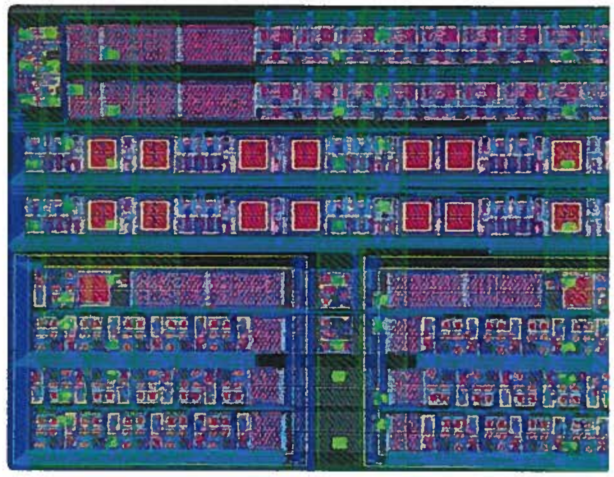
Custom infrared ROIC design

Custom ROIC design

Our ROIC design team is a group of highly skilled analog and digital designers. They design ROICs for InGaAs, QWIP, MCT, Bolometer, hybrid visible sensors or new emerging technologies. They create complex, high performance analog and digital full-custom CMOS integrated circuits. These offer major advantages to customers who seek customized solutions in applications where state-of-the-art designs are needed.

You can find examples of our designs in industrial automation, aerospace and aviation systems, automotive applications, (bio)-medical instrumentation, telecommunication, fiber optic sensing, and consumer products.



Full-custom designs generally require low noise, low dark current, or low power operation combined with high speed. Camera applications seek optimizations for short or long exposure times; complex windowing capability; specific pixel layouts. All these designs focus on the best possible performance level for a specific application, while keeping interfaces simple and recurring production costs low.

What do we offer?

Xenics has experience in a wide range of technologies and system applications but particularly in the field of infrared vision sensors. Our experience includes designs for high-performance, one-dimensional and two-dimensional, cooled as well as uncooled sensors for wavelengths ranging from NIR over SWIR, MWIR to LWIR.

Optronics Systems

MERLIN
LONG WAVE INFRARED DETECTOR

Selex ES designs, develops and manufactures Infrared (IR) detectors at its dedicated facility in Southampton, UK. With a reputation for providing customers with the best in high performance and cost-effective technology for IR camera systems, Selex ES offers a unique level of expertise.

The Merlin Long Wave Infrared (LWIR) detector is a 1024 x 768 Mercury Cadmium Telluride (MCT) Integrated Detector Cooler Assembly (IDCA). The Merlin LWIR detector is designed for very high performance imaging in the 8 - 10μm waveband.

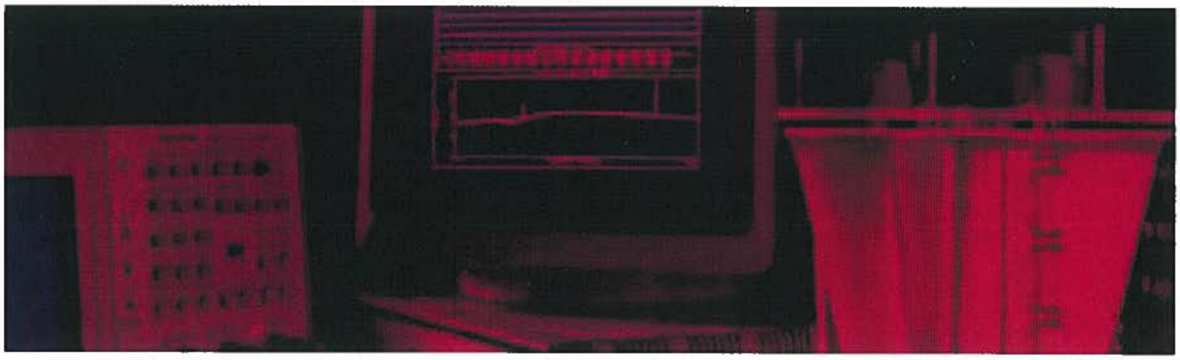
Using the Selex ES MCT process, the Merlin LWIR detector provides the highest environmental integrity along with the superior performance of focal plane detectors.

MAIN FEATURES

- Snapshot or interlaced operation
- Simple to use
- Long Wave (LW) 8 – 10μm
- Interlaced mode doubles charge capacity in each pixel for improved NETD
- High electro-optic performance with low crosstalk, automatic anti-blooming at the pixel level and excellent sensitivity
- Windowing gives enhanced frame rates over selected areas of the array
- Small element pitch enables miniaturisation of the Dewar assembly and optics
- Higher operating temperature than QWIPs
  - Longer cooler life
  - Less in-service support
  - Lower through-life cost
- Extremely short stare times for much less motion blur than QWIPs

KEY BENEFITS

- Low cost
- Compact
- Ultra high resolution
- High sensitivity



TECHNICAL SPECIFICATIONS

Format	
Array	1024 x 768 pixels
Pixel Pitch	16µm
Active Area	16.38 x 12.29mm

Typical Performance	
NETD (median)	32mK (23mK interlaced mode)
Pixel Operability	>99%

Interface Parameters	
Modes	Snapshot or interlaced
Configuration Control	Single serial interface
Output Voltage Range	2.5V
Charge Capacity	7 x 10^6 electrons (14 x 10^6 interlaced mode)
Number of Outputs	8
Pixel Rate	Up to 10MHz per output
Intrinsic MUX noise	50MV rms
Array Operating Temperature	Up to 90K
Nominal Operating Voltage	6V
Minimum Pins for Operation	20
Number of Input Clocks	1
Window Material	Germanium
Window Thickness	1.73mm

Product Description

The maritime cooled thermal imaging camera system survives in the harshest sea eavironment, auto tracking boat 30km, recognition suspect human activities up to 10km, mainly used for search and stable auto tracking task.

The system is composed by three parts: Pointer, Electronics Control Unit and Hand Control Unit. Pointer is including 640x512 30-600mm focus cooled infrared thermal imaging camera, visible light TV camera, high frequency laser rangefinder, 4 axis gyroscope stabilization turret and auto tracker. Hand Control Unit is including control key and operating lever, option display unit is included.

The maritime thermal camera system can be connected to a radar system, when the radar detects an object, the camera will automatically turn in the right direction and give you a visual image, so that you can instantly see what the blip on the radar screen really means, including fast moving objects.

EOST-3000M maitime thermal imaging camera system offer precise information and clear view, which is why TianYing Optical seeks to offer the most reliable surveillance solution. It is a fully stabilised, compactly designed surveillance system which bundles various state-of-the-art sensors. Thus, offering the user a large variety of functions comprised in only one device. EOST-3000M is available as a stand-alone unit or can be fully integrated into CMS and bridge systems.

Also it can be installed on vehicles or fixed mast for defense and security tasks.

EOST3000M 4-axis gyro stability platform 30km maritime cooled thermal camera system typical missions:
1) Maritime Patrol.
All weather surveillance, day/night long stand-off range detection, identification and tracking of naval targets.

2) Search And Rescue
All weather, day/night detection of naval units in distress and/or men at sea.

3) Coast Guard/Police Operations .
All weather, day/night detection and identification of illegal activities (immigration, smuggling, poaching, etc...).

4) Sentinel duties.
All weather, day/night support to independently perform surveillance, reconnaissance, target detection and track task when radar fails to work normally.

EOTS3000M 4-axis gyro stability platform 30km maritime cooled thermal camera system Main Features:
1) Stable 360 ° continuous turn gimble platfom with compact size and light weight.

2) High precision 4-axis gyroscope stabilization, the stabilisation accuracy: typical 20μradian .

3) High-performance 640x512 cooled thermal camera with powerful 20x optical zoom capability.

4) High-resolution, fully automatic visible light CCD camera with continuous 24x optical zoom.

5) Laser range finder with 1Hz, 2Hz, 5Hz, 20Hz continuous measureing frequency option.

6) Stable target tracking and Multi-model auto tracker.

7) Radar tracking and output target coordinate option.

8) Auto tracking boat beyond 30km, recognize suspect human activities up to 10km .

9) Capable of stand alone or integrated operations, independently perform surveillance, reconnaissance and target detection task when the radar fails to work normally.

10) Enables target detection in rough seas, supports all-weather, day or night missions, meets miliarys standard Mil-Std GJB 150 :Humidity, sand/dust, ice/freezing rain, shock, vibration,working low temperature (-40° C) and high temperature (+55 ° C).

EOST-3000M 4 axis grro stability 30km maritime thermal camera system Specification:

Model	EOST-3000M	EOST-2000M	EOST-100M
System type	4 axis stabilization	4 axis stabilization	2 axis stabilization
Azimuth range	360° continuous	360° continuous	360° continuous
Elevation range	-20° to +120°	-20° to +120°	-20° to +85°
Stabilization accuracy(RMS)	typical 20μrad	typical 10μrad	≤ 100μrad
IR thermal imager	cooled 640x512	cooled 640x512	uncooled 640x512
IR thermal imager FOV	18.3° to 0.9°	27.5° to 1.8°	6.2° x 5°
Detect human(94.5% success probability)	10km	5km	1500m
Recognize human(NATO 4347 STANAG)	6500m	3400m	1000m
Auto tracking helicopter/boat	≥30km	≥20km	≥5km
TV	Yes	Yes	Yes
Laser rangefinder	Yes	No	Option 2Hz continuous
Operating temperature	-40°C to 55°C	-40°C to 55°C	-40°C to 55°C
Environmental Standard	MIL-STD-GJB150	MIL-STD-GJB150	MIL-STD-GJB150
Weight	≤50kg	≤30kg	≤25kg

Note:
* According to NATO STANAG 4347, Detection need 1 lp/target that is 50% probability for 2°C temperature difference between target and background, Recognition need 3 lp/target, identification need 6 lp/target. Our detection human is use for 2 lp/target that is 94.5% success probability.

Product Description

EOST-210 UAV Helicopter Thermal Imaging Camera System is a compact, lightweight, 0.04mrad stable accuracy, dual-sensor auto tracking system, designed for pursuit/patrol and surveillance missions. This model is based on the 8 inch gimbal design, configured for specific law enforcement missions.

It uses, both during night and day, a thermal imager operating in the long wavelength spectrum (8÷12μ), based on the 640x512 uncooled Focal Plane Array (FPA) detectors with 60mm or 75mm lens optics.

For day operations, including low light conditions, EOST-210 utilize a 36x zoom TV colour camera for target search. This colour high magnification, long range TV camera spotter is available for target identification,even at long distance.

EOST210 device is a high-performance sensor turret system of the lightest weight and most compact size in world, also it is the world's number one selling law enforcement multi-sensor turret system.

EOST-210 UAV thermal camera surveillance and tracking system Typical Missions:

1) Maritime Patrol.

All weather surveillance, day/night long stand-off range detection, identification and tracking of naval targets.

2) Search And Rescue.

All weather, day/night detection of naval units in distress and/or men at sea.

3) Coast Guard/Police Operations.

All weather, day/night detection and identification of illegal activities (immigration, smuggling, poaching, etc...).

4) Land Operations.

All weather, day/night support to the operation of multirole armed helicopters employed for patrol, escort or protection of ground troops.

EOST-210 UAV thermal imaging camera auto tracking system Applications:

1. Counter Drug.
2. Homeland Security.
3. Patrol.
4. Surveillance.
5. Reconnaissance.
6. Search And Rescue.

EOST-210 UAV thermal imaging camera system Main Features:

1. Compact 8 inch gimbal

2. Light weight only 10kg with dual sensors.
3. High definition color CCD camera with 36x continuous focus optical.
4. Large format 640x512 IR with 75mm lens optics or 60mm lens optics.
5. High precision 2-axis gyroscope stabilization, the stabilisation accuracy: typical 40μradian (RMS).
6. Real-time offer high quality infrared thermal image and high definition visible light image at same time
7. Multi-model auto tracker
8. Human bionics controller.
9. Simplified common interface standard
10. Supports all-weather, day or night missions, meets miliarys standard Mil-Std GJB 150 :Humidity, sand/dust, ice/freezing rain, shock, vibration,working low temperature (-40° C) and high temperature (+55 ° C).

EOST-210 UAV/helicopter thermal camera system Sepcification:

Model	**EOST-210**
System type	2 axis gryo stabilization
Azimuth range	360° continuous
Elevation range	-120° to +20°
Stabilization accuracy(RMS)	typical 40μrad
IR thermal imager.	uncooled 640x512
NETD	Typical 40mk F1.0 @ 30° C
IR lens diameter	75mm F1.0
Field of View,°, horizontal * vertical	8.3° x 6.6°
IR stadia capability(human target)	≥1000m
IR stadia capability(vehicle target)	≥2000m
Mid range TV	Yes
Laser rangefinder.	No
Auto tracking	Yes
Environmental Standard	MIL-STD-GJB150
Gimbal diameter	8 inch
Weight	10kg
Standard Package	Stabilized Gimbal Assembly, Electronics Control Unit, simplified hand control unit, standard cable kit.

Note *- Technical information is subject to change without notice. ** -Depending on the region of sale

Re: ITAR Amendment—Category XII Comments

Dear Sirs:
We are commenting on proposed changes to USML Category XII, section c (7) regarding certain charge multiplication focal plane arrays and section c (8) regarding certain charge multiplication focal plane arrays in a permanent encapsulated sensor assembly.

It is our belief that while providing some restriction on the proliferation of charge multiplication focal plane arrays of US origin for military use, implementation of these changes as written would also hamper US based research in fields that are clearly non-military.

We propose that the following changes be made to this document:

- Clarify that the number of elements in an FPA refers only to those elements with radiant sensitivity exceeding the limit.
- Modify restrictions on the number of elements in a controlled FPA from >1600 to >2048.
- Exclude charge multiplication focal plane arrays that do not contain an internal electronic shutter.
- Exclude charge multiplication focal plane arrays with a maximum frame rate of 9 frames per second or less.

Electron multiplication charge-coupled devices (EMCCDs) have transformed many research areas but perhaps none more than life science research. In 2014 the Nobel Prize in Chemistry was awarded for super resolution fluorescent microscopy, an imaging technique enabled by EMCCDs. One of the prize recipients, Eric Betzig, did his work in Virginia, USA.

If the proposed changes to the USML are put in place, researchers in the US will not have access to a next-generation of high resolution EMCCDs. The restrictions on access to controlled technology by foreign nationals will effectively cut off their use in universities and research institutions. Foreign researchers outside the US will not suffer from these restrictions, putting them at an advantage. In order to level the playing field, the number of elements in a controlled FPA should be raised to at least 2049 or more.

The proposed rule does not distinguish between FPAs that contain an internal electronic shutter and those that do not. Full frame FPAs require an external shutter to block out light during readout while FPAs with an internal electronic shutter may be read out while exposing a new image. This reduces their *average* sensitivity by half and gives them limited usage in unpredictable dynamic imaging conditions. They are however, still quite useful in a controlled laboratory environment. FPAs without internal electronic shutters should be excluded.

Most e2v EMCCDs are manufactured with a metal mask covering some of the pixels in the focal plane array, rendering them insensitive to light. For example, a metal mask is used to cover the outer rows and columns of an image sensor in order to provide a dark reference. At e2v the metal mask is applied as part of the EMCCD fabrication process and cannot be removed without rendering the image sensor inoperable. The amendment e2v

wording should be changed to make it clear that the number of elements in an FPA refers only to those elements with radiant sensitivity.

e2v is a manufacturer of electron multiplication charge-coupled devices (EMCCDs). All e2v EMCCDs are manufactured in the United Kingdom and are sold through e2v's global sales offices. e2v EMCCDs are sold into the US and Canada and into various countries in Europe and Asia.

Over 95% of e2v EMCCDs sold in the US are supplied to OEM camera manufacturers who in turn manufacture cameras for end users in government institutions, universities and in industry. The largest end use market for EMCCD cameras is life sciences but they are also used in physical sciences such as spectroscopy and plasma diagnostics.

With enactment of this amendment, sales of ITAR controlled e2v EMCCDs into the US would be greatly curtailed. The reason for this is twofold: 1) it would be very difficult for e2v to honor its warranty since warranty return of EMCCDs to the UK would require an export license, putting an undue burden on e2v's US based customers and 2) US based OEM manufacturers of ITAR controlled EMCCD cameras would find their market outside of the US or into US institution employing foreign nationals greatly reduced by the time and difficulty inherent in obtaining an export license.

Enactment of these amendments would have no effect on the export of EMCCDs or EMCCD cameras out of the UK. Within the UK EMCCDs are considered dual use. EMCCDs may be exported from the UK to other EU member states without an export license being required. For exports to the following 7 countries – USA, Canada, Australia, New Zealand, Norway, Japan and Switzerland (including Lichtenstein) - there is an EU open export license available (Union General Export Authorisation No EU001). Exports to other countries require an individual export license from the UK government.

Sincerely,

Alice Reinheimer

Washington, DC 25022

Subject: **Comments on Proposed Revisions to USML Category XII**
80 *Fed. Reg*. 25,821 (May 5, 2015); RIN 01400-AD32

Dear Mr. Peartree:

Elbit Systems of America, LLC ("ESA") welcomes the opportunity to provide comments on the proposed revisions to USML Category XII (Fire control, range finder, optical and guidance and control equipment) of the International Traffic in Arms Regulations (ITAR).

Our comments, detailed below, propose several changes and fall into two general categories:

- Requests for clarification or modification of certain terms and important explanatory notes that are critical for defining the precise scope of Category XII(c); and

- Modifications to certain technical control parameters to ensure that Category XII(c) does not capture systems (or components thereof) that are in normal commercial use and available from foreign suppliers.

I. BACKGROUND

Our comments address how the proposed revisions to Category XII(c) would negatively affect U.S. industry in connection with the future development, sale and support of one specific type of infrared imaging system that currently is in widespread use on commercial transport aircraft and business jets – enhanced vision systems ("EVS"). These systems primarily use cooled infrared imaging systems to provide improved pilot visibility. The EVS system allows flight operations and identification of runway lights/ground features in darkness, smoke, haze, rain, fog and other low visibility conditions. EVS systems are widely used on civil aircraft (*e.g.*, commercial transport aircraft and business jets). EVS systems also are available on the commercial market from foreign suppliers, including CMC Electronics (Canada) and Thales (France).

Based on our review, it does not appear that the U.S. Government agencies involved in this process have sufficiently considered the extent to which the proposed revisions to Category XII(c) will negatively impact U.S. companies that manufacture, sell and support commercial EVS systems. If implemented as drafted, the requirements and restrictions in proposed Category XII(c) that will be applicable to EVS systems (and key components thereof) will curtail the use of such systems by imposing unreasonable burdens on sale and support activities, and will discourage future development and implementation of advanced infrared imaging technology into EVS systems. Ultimately, these overly broad restrictions could affect aviation safety and could cause potential owners and operators to purchase foreign-origin systems to the detriment of U.S. industry.

Due to the uncertainty of jurisdiction determinations, U.S. companies in the infrared imaging sector have obtained Commodity Jurisdiction determinations covering current versions of their systems. DDTC has clearly and consistently reaffirmed that previous CJs will remain valid notwithstanding the final revisions USML Categories resulting from the Export Control Reform process. *See, e.g.,* 78 *Fed. Reg.* 22740, 22750 (Apr. 16, 2013).

A primary concern, however, is how the proposed changes to Category XII(c) will affect the next-generation of commercial EVS systems. Next-generation EVS systems will almost certainly incorporate higher-performance IRFPAs and other components – the specifications and performance capabilities of which may be captured by this proposed revision of Category XII(c). There is no guarantee that past trends of obtaining CJ determinations that such systems are subject to the EAR will continue under the revised Category XII, and lack of clarity in the important explanatory notes and definitions (discussed below) may lead to uncertainty in the controls over future EVS systems, or – at worst – ITAR control over these purely commercial systems. Should this occur, U.S. industry will be placed at an extreme competitive disadvantage vis-a-vis foreign suppliers of EVS systems.

II. COMMENTS ON DEFINITIONS & EXPLANATORY NOTES

A. <u>Note 2 to Paragraph (c)</u> – Two proposed changes

1. Clarify the specific requirements for paragraph (c) articles to become subject to the EAR after integration into EAR items – including further elaboration on what is considered "inoperable"

Note 2 to paragraph (c) defines a release from ITAR controls for certain articles identified in paragraph (c) when such articles are incorporated into EAR items. Specifically:

> The articles described in paragraphs (c)(1) through (5), (c)(7), (c)(8), and (c)(12) other than (c)(12)(ix) having greater than 640 detector elements in any dimension, and (c)(12)(x) are subject to the EAR when, prior to export, reexport, retransfer, or temporary import, they are integrated into and included as an integral part of an item subject to the EAR, and cannot be removed without destruction or damage to the article or render the item inoperable.

Assuming that an eligible paragraph (c) "article" is integrated into and included as an integral part of an "item" subject to the EAR, then – as Note 2 currently is drafted – the paragraph (c) article will be subject to the EAR if it (*i.e.*, the paragraph (c) "article") cannot be removed from the EAR item without:

1. Destruction or damage to the "article" (*i.e.*, the paragraph (c) article); <u>*or*</u>

2. "render the item inoperable."

The first situation described above appears fairly straightforward. A paragraph (c) article meets the requirement of Note 2 and is subject to the EAR if it is integrated into an EAR item and cannot be removed from that EAR item without damage or destruction of the paragraph (c) article.

The second situation under which the paragraph (c) article becomes subject to the EAR requires clarification. In this situation, "inoperable" describes the "item," which clearly refers to the EAR item into which the paragraph (c) article is integrated. This is consistent with the presumably intentional use of the terms "item" and "article" in the beginning of Note 2 and well-established ITAR and EAR terminology (*i.e.*, the EAR controls "items;" the ITAR controls defense articles). The proposed language, however, does not provide clear guidance regarding the circumstances under which an EAR item will retain its EAR jurisdiction if it incorporates an article that is enumerated in paragraph (c).

<u>Proposed Change(s)</u>:

- Clarify that Note 2 to paragraph (c) does *not* in either situation described above require destruction or damage to the EAR item upon removal of the paragraph (c) article. Rather, all that is required to satisfy the requirements of Note 2 is that the removal of the paragraph (c) article must result in a situation where the EAR item is rendered "inoperable." The revised Note 2 also should specifically state that "inoperable" does not mean "destroyed or damaged" but simply means that the EAR item is incapable of being operated for its intended purpose until such time as the paragraph (c) article – or a one-for-one replacement thereof– is placed back into the EAR item.

- Alternatively, if the intent of Note 2 was to require that removal of the paragraph (c) article would result *in the paragraph (c) article* being rendered "inoperable," then the closing language of Note 2 should be revised to state:

  > …and cannot be removed without destruction or damage to the article or render**ing** the ~~item~~ **article** inoperable.

  If this was the intent, the revised Note 2 should clarify that "inoperable" in this case has a meaning similar to that described above (*i.e.*, the paragraph (c) article is incapable of being operated for its intended purpose once it has been removed from the EAR item). Further, the note should clarify that no damage or destruction to the paragraph (c) article is required to render the paragraph (c) article "inoperable" for purposes of applying Note 2 to paragraph (c). Rather, the article can be rendered "inoperable" by design limitations, such as unique interfaces or operating software that would not allow the paragraph (c) article to operate as intended in any higher-level system other than the type of EAR item for which the article was designed or manufactured.

Finally, the same clarifying changes described above should be made to the Note to paragraph (e). The Note to paragraph (e) is essentially identical to Note 2 to paragraph (c) except that the Note to paragraph (e) applies to parts, components, accessories, attachments and associated equipment identified in proposed paragraph (e) rather than articles in paragraph (c).

2. Note 2 to paragraph (c) should include IDCAs described in paragraph (c)(9)(i) within its scope

Only certain items listed in the first sentence of Note 2 to paragraph (c) are eligible to become subject to the EAR if they satisfy the requirements of the Note. The articles that are eligible for such treatment include most of the major building blocks for infrared imaging systems – IRFPAs described in paragraph (c)(2), several types of permanently encapsulated sensor assemblies described in paragraphs (c)(3) to (c)(5) and certain infrared camera cores described in paragraph (c)(12).

The list of articles eligible for Note 2, however, does *not* include the following articles described in paragraph (c)(9)(i):

> Integrated IRFPA dewar cooler assemblies (IDCAs), with or without an IRFPA, having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours

The omission of paragraph (c)(9)(i) from Note 2 to paragraph (c) would defeat the entire purpose of the Note – at least as it applies to cooled infrared imaging systems. The IDCA integrates the IRFPA and the required cooling system into a single, combined unit. This increases reliability and thermodynamic efficiency, and allows the system to be cooled by a smaller cryocooler with lower power consumption. Virtually all cooled infrared imaging systems incorporate an IDCA.

Although the use of cooled infrared imaging systems traditionally has been more widespread in military applications, there are now well-established commercial applications for cooled systems – and it is expected that the commercial market for cooled systems will continue to expand. One such application is EVS systems. Others include scientific research and industrial test and measurement applications (*e.g.*, semiconductor inspection equipment), described in Section III(A) below. The majority of EVS systems used on civilian aircraft are cooled systems that incorporate IDCAs. Moreover, as described below, we understand that the cryocoolers incorporated into IDCAs for systems used in commercial applications have performance capabilities that greatly exceed those currently specified in paragraph (c)(9)(i).

The purpose of Note 2 to paragraph (c) is to suspend the ITAR principle often referred to as the "see through" rule and enable certain types of infrared imaging systems to be exported as EAR items even if such items incorporate individual articles that are identified in paragraph (c) – provided that the terms of paragraph (c) are satisfied. By virtue of Note 2, an EAR item can incorporate a paragraph (c)(2) IRFPA, a permanent encapsulated sensor assembly in paragraphs (c)(3) to (c)(6) or certain infrared imaging cores in (c)(12) and still be exported as an EAR item.

Omitting IDCAs in paragraph (c)(9)(i) from Note 2, however, destroys any benefit of Note 2 for U.S. companies that manufacture, sell and support commercial cooled infrared imaging systems. All cooled infrared imaging systems incorporate an IDCA. Thus, as Note 2 is currently drafted, it would appear that any cooled infrared imaging system that incorporates an IDCA with what we understand to be a standard commercial cryocooler will not be eligible for Note 2 and will continue to be subject to ITAR controls – even if that system was clearly developed for, marketed, sold and used solely for commercial applications.

This outcome does not make sense for policy reasons. One important purpose of Note 2 appears to be that it allows U.S. companies to compete with foreign suppliers of cooled systems for sales in commercial applications, while retaining ITAR controls over certain individual components and technologies incorporated in those systems. Such treatment may be warranted when certain very high-performance IRFPAs or camera cores with special capabilities unique to the military are incorporated into an EAR item. However, we understand that most cryocoolers currently used in IDCAs available on the commercial market from foreign suppliers satisfy the very low performance and reliability requirements specified in paragraph (c)(9)(i). It is not clear why Note 2 would allow for a commercial infrared imaging system to remain subject to the EAR if it incorporates a high-performance IRFPA that is classified in paragraph (c)(2) or an equally capable permanent encapsulated sensor assembly in paragraphs (c)(3) to (c)(5), but that same system incorporating an IDCA with a much less capable IRFPA and a standard, commercially available cryocooler would not be eligible for Note 2.

The omission of paragraph (c)(9) from Note 2 also does not make sense when the overall structure and organization of paragraph (c) is considered. Paragraph (c) starts with bare IRFPAs, then identifies permanent encapsulated sensor assemblies, then IDCAs, then camera cores and ultimately complete infrared imaging systems. As explained in the Federal Register notice, once a lower level article is incorporated into a higher order system, the higher order system will not be subject to the ITAR unless it is specifically enumerated. The regulatory language that achieves this objective is Note 2 to paragraph (c). At each level, most paragraphs are eligible for Note 2, with certain, specified exceptions (*e.g.*, multispectral IRFPAs, sensor assemblies and camera cores). However, *none* of the IDCAs in paragraph (c)(9) are eligible for Note 2. This is even more confusing when one considers paragraph (c)(12)(iv), which identifies complete infrared imaging camera cores that include an IDCA described in paragraph (c)(9). The camera core in paragraph (c)(12)(iv) is eligible for Note 2. However, the same IDCA in that camera core would not appear to be eligible for Note 2 when included in a different higher order system.

<u>Proposed Change(s)</u>: Revise the first sentence of Note 2 to paragraph (c) to include articles identified in paragraph (c)(9)(i) as follows:

> The articles described in paragraphs (c)(1) through (5), (c)(7), (c)(8), **(c)(9)(i),** ~~and~~ (c)(12) other than (c)(12)(ix) having greater than 640 detector elements in any dimension, and (c)(12)(x) are subject to the EAR …

B. <u>Note 1 to Paragraph (c)</u> – Clarify what constitutes a "permanent encapsulated sensor assembly"

Please provide further clarification as to the meaning of Note 1 to paragraph (c).

In addition, we request that the reviewing agencies consider the effect that the proposed definition of "permanent encapsulated sensor assembly" will have on the ability of U.S. companies to provide repair and maintenance services for infrared imaging systems used in exclusively commercial applications. For owners and operators of EVS systems, total cost of ownership is extremely important. A definition of "permanent encapsulated sensor assembly" that requires destruction or damage to the IRFPA or the sensor assembly upon access or removal effectively prevents any repairs to the sensor assembly. The cost to replace a faulty sensor assembly with an entirely new sensor assembly can be very expensive. For this reason, the sensor assembly – as well as other individual components and LRUs – must be repairable in some manner to keep system costs contained.

Instead of a standard that requires damage or destruction to the IRFPA, the reviewing agencies should consider a standard that recognizes that repairing a sensor assembly requires a high degree of knowledge, specialized tooling and fixtures, and that such activities are normally performed by the manufacturer. Moreover, the definition should reflect the fact that these types of IRFPAs and sensor assemblies are highly engineered products that are packaged and integrated into higher level systems through complex manufacturing processes. They cannot be simply "unplugged" and easily diverted to another application.

<u>Proposed Change(s)</u>: Consider modifying Note 1 to paragraph (c) to read as follows:

> A permanent encapsulated sensor assembly (*e.g.,* sealed enclosure, vacuum package) **is one that is not designed to be easily disassembled and requires specialized tooling, fixtures and engineering knowledge to disassemble without causing damage or destruction to the sensor assembly, the IRFPA or its other components.**

C. Include the definition of "multispectral" from the explanatory language of the *Federal Register* Notice in the regulations

The term "multispectral" is used as a control parameter in revised paragraphs (c)(2), (c)(6), (c)(12)(x), (c)(16)(v) and (e)(4)(iv). This term, however, is not defined in the text of the proposed paragraph (c).

Proposed Change(s): Include the definition of "multispectral" within the text of the revised Category XII to clarify the scope of the paragraphs in Category XII that rely on this term as a control parameter.

III. COMMENTS ON SPECIFIC CONTROL PARAMETERS IN CATEGORY XII(C)

One core principle of the Export Control Reform initiative is that items in normal commercial use should not be identified on the USML unless such items provide the United States with a critical military or intelligence advantage. The *Federal Notice* detailing the proposed revisions to Category XII specifically claims the following with respect to the technical control parameters in revised Category XII(c): "These control parameters are set at a level that the Department has determined excludes most commercial products."

It appears, however, that several of the control parameters in the proposed revisions to paragraph (c) will capture articles that we believe are in normal commercial use and are available from foreign suppliers. Unintended controls over such articles can be avoided, however, with changes to certain explanatory notes and definitions (*see* Section II), as well as with certain specific adjustments to the proposed control parameters for several paragraphs in proposed paragraph (c). These modifications will ensure that the revised paragraph (c) does not impose controls over IRFPAs, sensor assemblies and related items that are manufactured and sold by foreign companies for use in commercial applications. We have provided specific comments below, along with examples that "demonstrate actual commercial use, not just potential or theoretical use, with supporting documents, as well as foreign availability of such items." *See* 80 *Fed. Reg.* 25,821 (May 5, 2015).

A. Paragraph (c)(2) – Limit overly broad scope by including a "specially designed" limitation

Revised paragraph (c)(2) would control IRFPAs of various types that are not integrated into a permanent encapsulated sensor assembly (*i.e.*, bare IRFPAs).

The proposed language would control virtually all bare IRFPAs regardless of the nature of the application for which they were developed or in which they are used. All IRFPAs that meet these minimal requirements would be subject to control under paragraph (c)(2), even if they were originally designed for use in "dual use" or entirely commercial applications and have been used exclusively in such applications. Numerous commercial and civil applications, including EVS systems, utilize IRFPAs that would be captured by the extremely broad language of proposed paragraph (c)(2).

U.S. industry is not the predominant designer or manufacturer of infrared imaging technology worldwide. Although there is design and production activity in the United States, a substantial amount of research, development and production of IRFPAs, infrared imaging systems and related items currently occurs outside of the United States, namely in:

- Israel (Semiconductor Devices Ltd.)

- France (ULIS, SOFRADIR)
- Japan (Hamamatsu Photonics K.K.)
- United Kingdom and Italy (Selex ES)
- Germany (AIM Infrarot Module GmbH, Optris)
- Belgium (Xenics NV)

We understand that these foreign companies have conducted extensive research and development and have worked to advance the use of high-end infrared imaging systems in a wide variety of commercial and civil applications. For example, we understand that cooled IRFPAs manufactured by Semiconductor Devices Ltd. in Israel are sold worldwide for use in a wide variety of commercial applications, such as:

- Scientific research and development applications, such as geology and earth mapping, mineralogy studies, surface and emissivity studies, gaseous cloud studies and art inspection;

- Public health and safety applications, such as security systems, pollution monitoring, firefighting and forest fire monitoring;

- Industrial applications, such as predictive maintenance, leak detection in electrical utilities and manufacturing plants, non-destructive testing, process and quality control applications, mapping, high temperature thermography, semiconductor inspection, non-contact temperature measurements; and

- Navigation systems, such as EVS systems and automobile enhanced vision systems

In addition to SCD, we understand the following foreign companies also develop, manufacture and sell photon detector IRFPAs and detector modules for use in commercial infrared systems include:

- SOFRADIR (France), *see* http://www.sofradir.com/products/

- Selex ES (United Kingdom and Italy), *see* http://www.selex-es.com/product-portfolio/optronics-system/thermal-detectors

- Hammamatsu Photonics K.K. (Japan), *see* http://www.hamamatsu.com/us/en/product/category/3100/4007/4165/index.html

- Xenics NV (Belgium), *see* http://www.xenics.com/en/products/cameras?f[0]=field_cooled_term%3A632

Proposed Change(s): Use the established definition of "specially designed" in ITAR §120.41 to narrow the overly broad scope of paragraph (c)(2) as follows:

> Photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) **specially designed for defense articles in this subchapter;** ~~and~~ having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm; and not integrated into a permanent encapsulated sensor assembly, and detector elements therefor

Including a "specially designed" qualifier would be consistent with other USML Categories that have been revised as part of the Export Control Reform process. As frequently explained by DDTC and BIS officials, the purpose of the "specially designed" definition is to provide a consistent and objective method to identify items that, as a result of development, have properties peculiarly responsible for achieving or exceed relevant performance levels, characteristics or functions. Thus, limiting paragraph (c)(2) to IRFPAs that are "specially designed" for defense articles would provide a clear method for excluding from ITAR control IRFPAs that were designed exclusively for commercial applications or that have demonstrably been sold for and used in bona fide commercial applications, while maintaining ITAR controls over those IRFPAs that have some feature, performance capability or characteristic particular to military applications.

In addition, as noted above, the definition of the term "multispectral" should be included in or immediately after paragraph (c)(2), since this is the first use of the term in Category XII(c).

B. <u>Paragraph (c)(4)</u> – Increase control parameter for number of detector elements and/or include "specially designed" limitation

Revised paragraph (c)(4) would control:

> Two-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly, having greater than 256 detector elements.

The control parameter of "256 detector elements" requires further clarification. An IRFPA with 256 *total* detector elements would have a resolution of 16 x 16 or lower. Our engineers are not aware of any two-dimensional IRFPAs with such a small number of total detector elements. Certain one-dimensional IRFPAs may have total detector elements at this level. However, one-dimensional photon detector IRFPAs are specifically addressed in proposed paragraph (c)(3), which includes a control parameter of greater than 640 total detector elements. Thus, it appears that the intent of proposed paragraph (c)(4) may have been to control IRFPAs in a permanently encapsulated sensor assembly having greater than 256 detector elements *in any dimension* rather than IRFPAs simply having greater than 256 total detector elements.

Even if the intent was to control IRFPAs with greater than 256 detector elements "in any dimension," we believe that this parameter is still be far below the resolution of photon detector IRFPAs that are used in established commercial infrared imaging systems. For example, according to publicly available marketing information:

- Thales (France) manufactures an Enhanced Vision System for use on civilian transport and business jet aircraft with a 1024 x 768 resolution IRFPA, which equates to 787,000 total detector elements. *See* https://www.thalesgroup.com/sites/default/files/asset/document/thales_evs_sheet_canada.pdf.

- CMC Electronics (Canada) manufactures the CMA-2700 Enhanced Flight Vision Systems for use on civilian transport and business jet aircraft with a 640 x 512 pixel InSb IRFPA, which equates to 327,680 total detector elements. *See* http://www.cmcelectronics.ca/pdf/SureSight_4pager.pdf.

- DCG Systems, Inc. sells a semiconductor inspection system that includes a cooled infrared camera with a 1024 x 1025 pixel MCT IRFPA, which equates to 1,049,600 total detector elements. *See*, e.g., http://dcgsystems.com/products/electrical-fault-analysis/meridian-line/meridian-iv/ (This camera was determined to be subject to the EAR and classified in ECCN 6A002.b.4 via a December 2014 Commodity Jurisdiction.)

- Telops, Inc. (Canada) sells the TS-IR Thermal Scientific IR Camera, with a cooled InSb or MCT IRFPA of 640 x 512 pixels, which equates to 327,680 detector elements. *See* http://www.telops.com/en/infrared-cameras/ts-ir-thermal-scientific-ir-camera

Finally, as noted in Section III(A) above, two dimensional photon-detector IRPFAs (or detector modules incorporating such IRFPAs) with total detector elements greatly exceeding 256 are available from multiple suppliers worldwide – including SCD Ltd, SOFRADIR (France), Xenics (Belgium), Hammamatsu (Japan) and Selex (U.K. & Italy).

Proposed Change(s): To reflect the current performance capabilities of two-dimensional photon detector IRFPAs that are available from foreign suppliers and used in commercial applications, paragraph (c)(4) should be modified as follows:

> Two-dimensional photon detector IRFPAs described in paragraph (c)(2) in a permanent encapsulated sensor assembly, having greater than ~~256~~ **1024** detector elements **in any dimension**.

Alternatively, instead of adjusting the technical parameters, DDTC could achieve the same objective by incorporating a "specially designed" limitation, as follows, for the same reasons described in Section III(A) above:

> Two-dimensional photon detector IRFPAs described in paragraph (c)(2) in a permanent encapsulated sensor assembly, **specially designed for defense articles in this subchapter** and having greater than 256 detector elements **in any dimension**.

C. Paragraphs (c)(6), (c)(12)(vi) & (c)(12)(ix) – Increase the lower end of the wavelength range control parameter

The control parameters in paragraphs (c)(6) (for multispectral IRFPAs) and (c)(12)(vi) & (ix) (infrared imaging camera cores) are based on the article having a peak response within a range of wavelengths, as follows:

Paragraph	Peak Response Wavelength
(c)(6)	Any spectral band between 1,500 nm and 30,000 nm
(c)(12)(vi)	Any spectral band between 2,500 nm and 30,000 nm
(c)(12)(ix)	Any spectral band between 2,500 nm and 30,000 nm

EVS systems that are in normal commercial use on civil aircraft operate in the 400 nm – 5,000 nm spectral band because this is the spectral band that includes airport/runway approach lighting and enhanced LED lighting. An approach to the airport during marginal weather is the most critical phase of an aviation enhanced vision system. The pilot must be able to see the airport approach lights and then the airport environment to enable him/her to continue the approach to landing.

Proposed Change(s): To avoid capturing IRFPAs and camera cores that operate in a spectral range applicable to visible and enhanced LED lighting, we propose increasing the lower limit of the wavelength range control parameter for the paragraphs cited above as follows:

(c)(6) Multispectral IRFPAs in a permanent encapsulated sensor assembly, having a peak response in any spectral band within the wavelength range exceeding ~~1,500 nm~~ **6,000 nm** but not exceeding 30,000 nm.

(c)(12)(vi) A one-dimensional or two-dimensional photon detector IRFPA described in (c)(2) having a peak response within the wavelength range exceeding ~~2,500 nm~~ **6,000 nm** but not exceeding 30,000 nm and greater than 256 detector elements **in any one dimension**

(c)(12)(ix) A two-dimensional photon detector IRFPA described in (c)(4) having a peak response within the wavelength range exceeding ~~2,500 nm~~ **6,000 nm** but not exceeding 30,000 nm

D. Paragraphs (c)(9)(i) & (e)(7)(i) – Decrease the temperature threshold and increase the MTBF threshold for cryocoolers

Proposed paragraph (c)(9)(i) would control IDCAs that have "a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours."

Proposed paragraph (e)(7)(i) would control the individual cryocoolers that have the same performance and reliability specifications.

As noted above, most EVS systems used on civil aircraft incorporate cooled infrared imaging systems, which means that they must incorporate a cryocooler to maintain the IRFPA at a very low temperature. Based on our research, the proposed control parameters for cryocoolers focusing on temperature and reliability metrics are set at levels that are well below those of cryocoolers that are currently used in commercial applications and that are available from foreign suppliers.

- Temperature: Most cooled infrared detectors operate in the 60 K to 100 K range (*i.e.*, -213°C to -193°C), depending on the detector type and performance level. A cryocooler that is designed to operate at 77 K is very common because this temperature is relatively easily achievable with liquid nitrogen. These levels are well below the proposed control parameter of 218 K (-55°C).

- MTTF: An MTTF of only 3,000 hours is *far below* the current reliability levels of cryocoolers that are available from foreign suppliers. The product selection website of Thales (France), a major foreign manufacturer and supplier of cryocoolers, indicates that the *lowest* MTTF for any of the cryocoolers on the website is 24,000 hours – or *8 times* longer than the proposed MTTF threshold. *See* http://www.thales-cryogenics.com/product-category/coolers/.

In addition, it is not clear why the proposed control parameter for reliability is based on "mean-time-to-failure" ("MTTF") rather than "mean-time-between-failures" ("MTBF"). MTBF is the expected time between two successive failures of an item or a system. MTTF is the expected time to failure, which implies that the item or system is a consumable (*i.e.*, not repairable). Our experience has been that the commercial marketplace prefers MTBF as a metric because it indicates that the system is repairable, thus more cost effective. As noted above, cost of operation is extremely important. Customers and operators of EVS systems demand high reliability components. Customers have contractual MTBF requirements that exceed 10,000 hours – well above the proposed 3,000 hour MTTF threshold. If MTTF is retained as a control parameter, then the reviewing agencies should consider also including MTBF at a level equivalent to the final MTTF figure.

Proposed Change(s): Paragraphs (c)(9)(i) and (e)(7)(i) should be modified as follows:

(c)(9)(i) Cryocoolers having a cooling source temperature below ~~218 K~~ **77 K** and a ~~mean-time-to-failure (MTTF)~~ **mean-time-between-failure** (**MTBF**) in excess of ~~3000 hours~~ **10,000 hours**

(e)(7)(i) Cryocoolers having a cooling source temperature below ~~218 K~~ **77 K** and a ~~mean-time-to-failure (MTTF)~~ **mean-time-between-failure** (**MTBF**) in excess of ~~3000 hours~~ **10,000 hours**

* * *

If you have any questions concerning these comments, please do not hesitate to contact Karen Wyman, ESA's Trade Compliance Manager responsible for assembly of these comments, at 603.886.2206 or via email at karen.wyman@elbitsystems-us.com.

Sincerely,

Ben Gaffield

Subject: ITAR Amendment—Category XII.
Date: Monday, July 06, 2015 5:18:48 PM

To: US Department of State
Subject: Proposed changes to bring ICCD, EMCCD and InGaAs camera technologies under ITAR regulations

Dear Sir/Madam:

I am an astronomer at Southwest Research Institute in Boulder, CO. My colleagues and I have funded NASA and NSF programs to observe occultations (events where a planet moves briefly in front of a star) to probe planetary atmospheres. This technique has a long and rich history of results, including the discovery of Pluto's atmosphere.

This research requires that we take cameras to areas on the Earth where the events will be observable -- for example, we just returned from Australia and New Zealand, where we observed Pluto moving in front of a bright star from seven ground-based locations. These observations require low readnoise, high frame rate cameras, like our EMCCDs.

I am concerned that our EMCCD cameras, which we purchased under a NASA grant explicitly for observing events at locations over the world, will become regulated. Specifically, I'm concerned that cameras which we have used on telescopes over the world for the past six years will no longer be allowed on foreign deployments.

This development is especially confusing because both EMCCD and InGaAs cameras are available from non-US vendors. We could, for example, buy Raptor's EMCCD and InGaAs cameras (from the UK) and have them shipped to Australia for observations. If EMCCD and InGaAs cameras cannot be taken out of the US for observations, then we cannot meet the proposed goals in our funded NASA programs.

Thank you for your attention.

Regards,
-Eliot

Washington, DC 20037

Subject: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

My company is called Exciting Technology LLC, but my comments are mostly my own. I also am part time Technical Director for LOCI, the Ladar and Optical Communications institute. I am advising two Phd students and one masters student. I spent 40 years working for the United States Air Force. When I retired I was chief scientist for the sensors directorate, Air Force Research Laboratory. My protocol equivalent was that of a 1 star general officer. Since retiring I was vice chair of the "Seeing Photons", the National Academy of Sciences, NAS, study on passive EOIR detectors and receivers, published in 2010. I was co-chair of the Optics and Photonics: Essential Technologies for our Nation" NAS study that resulted in a fast track White House study to respond to our recommendations. I was chair of the "Laser Radar" NAS study published in 2014. Laser Radar is equivalent to Lidar and Ladar. Many of my comments result for the fact that each of these NAS studies were asked to compare the state of the art in the United States against the SOA in of the rest of the world. Therefore in Passive EO/IR Sensors, any optical systems, and in active EO/IR sensors I have been responsible within the past 5 years for comparing US SOA vs. the rest of the world SOA.

I will make comments as I go through the proposed cat 12 regulations. Because the active EO sensing study was more recent, and many of my comments are similar for active and passive sensors, I will focus my comments on the active EO sensors. I think a substantial revision of this Cat 12 work is required. As currently structured it expands the wall around exports, in contrast to my understanding of the direction. In my opinion this will hurt both US industry and the US military. For the NAS studies I have chaired it is obvious our export restrictions have not keep technology expertise in the United States, but have caused the United Sates to lose its lead in many technical areas. With respect to passive EO systems I recommend those involved with this effort read "Seeing Photons: Progress and Limits of Visible and Infrared Sensor Arrays", published by the NAS in 2010. With respect to Active EO systems I recommend those involved read "Laser radar" Progress and opportunities in Active Electro-optical Sensing", published by the NAS in 2014. For active EO systems I also recommend my Field Guide to Lidar book.

a (2)
i: "An infrared focal plane array having a peak response at a wavelength exceeding 1,000 nm"

This rule obviously dramatically expands the area covered by ITAR in direct contradiction of the guidance that caused the Cat 12 revision. There are a wide variety of FPAs commercially available with a wavelength response above 1000nm. While I could quote probably 100 products commercially available with response over 1000 nm just look on the internet. We certainly have uncooled FPAs. We have the NIR FPAs, many of which are available from overseas companies. Most of the product line of SOFRADIR in France would be covered by this restriction.

a (4) "Laser spot trackers or laser spot detection, location or imaging systems or equipment, with an operational wavelength shorter than 400 nm or longer than 710 nm, and a detection range greater than 300 m"

b (2) "Aiming or target illumination systems or equipment having a laser output wavelength exceeding 710 nm;

For both of the above areas I do not see the rational for restricting these wavelengths.

b (3) Laser rangefinders having any of the following:

(i) Q -switched laser pulse; or

Q switched lasers are very common around the world. I think this restriction will hurt US industry compared to the rest of the world, and will indirectly hurt the US military because they will end up having to buy their systems overseas rather than from US suppliers.

(ii) Laser output wavelength exceeding 1,000 nm

Lasers with output exceeding 1000 nm are very common around the world. Same comment on hurting US industry and the US military.

(5) Systems or equipment that use laser energy with an output wavelength exceeding 710 nm to exploit differential target - background retroreflectance in order to detect personnel or optical / electro -optical equipment (e.g., optical augmentation systems);

I am not sure I can think of a commercial use for OA systems, so this might be okay even though the wavelength restriction does not make a lot of sense based on state of the art around the world.

(6) Light detection and ranging (LIDAR), laser detection and ranging (LADAR), or range-gated systems or equipment, incorporating or specially designed to incorporate an article controlled in this subchapter (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km Note to paragraph (b)(6) :This paragraph does not control LIDAR systems or equipment for civil automotive applications having a range limited to 200 m or less

Lidar is being used around the world. It is correct that auto lidar is one of the larger coming uses. Exempting any auto lidar is a good thing. There are also widespread 3D mapping lidars. OPTEC (Canada) and Riegl (Germany) are two of the largest manufacturers. Due to ITAR controls it is not surprising the US does not have a larger manufacturer of 3D lidar. The Microsoft connect is a short range gaming system that is widespread and is essentially a lidar. Wind sensing lidars are sold world wide.
The US military has a definite need for 3D mapping systems. Continuing to discourage 3D mapping commercial lidar technology in the United States, as this paragraph does because 3D mapping technology will be beyond 200 meters, will hurt the US military.

(7)
"Synthetic aperture LIDAR or LADAR systems or equipment, having a stand - off range of 100 m or greater "

This shows a lack of understanding of what is critical in a synthetic aperture lidar. The max range of the lidar is mostly controlled by the power of the laser. More powerful lasers are widely available. Germany probably has the lead. If this line item talked about how many times better the SAL's resolution is than the diffraction limit of its real receive aperture size, or than the r_0 of the atmosphere, then this could make sense. Something like 10 times better resolution then the diffraction limit of the receive aperture, and/or 10x the diffraction limit of an aperture with a diameter equal to r_0 might make sense.

(8)
LIDAR, LADAR, or other laser range -gated systems or equipment,
as follows (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km):
(i) Systems or equipment having a resolution (i.e., ground point spacing) of 0.2 m or less (better) from an altitude above ground level of greater than 16,500 ft , and incorporating or specially designed to incorporate a gimbal - mounted transmitter or beam director, and specially designed parts and components therefor

(ii) Aircraft systems or equipment having a laser output wavelength exceeding 1,000 nm and a detection range exceeding 500 m for an obstacle with a diameter or width less than or equal to 10 mm (e.g.,wire, power line);

(iii) Systems or equipment having an electrical bandwidth of 100 MHz or greater, and incorporating or specially designed to incorporate either a Geiger - mode detector array having at least 32 elements or a linear- mode detector array having at least 128 elements;

Could a Geiger mode auto-lidar have 32 or more elements, or could a linear mode auto lidar have more than 128 elements? I know from discussions with one large auto manufacturer that they will avoid any technology that has ITAR related entanglements.

It likely the full GMAPD arrays will be more expensive then auto companies want anyway, but if you could at least double these values it would increase the chances US companies could compete in the auto lidar area. For US companies to compete in 3D mapping I think you would have to allow them to use a 32 x 32 GMAPD or a 128 x 128 LMAPD, although they might be able to compete with smaller arrays. 3D mapping will want better than 5 foot range resolution, so the 100 Mhz limitation will catch 3D mappers. It would be very desirable if 3D mapping lidar develop could be encouraged in the United Sates, rather than being discouraged.

(14) Developmental lasers and laser systems or equipment funded by the Department of Defense

This is a huge expansion of the ITAR restrictions that will really hurt the US military, assuming I am right in interpreting this to say as soon as a laser company takes any DOD funding to work on a laser then that laser is caught by ITAR. This means a company cannot accept any DOD funding for lasers it is developing primarily for commercial application. It has to strictly divide its product line into military and non-military lasers. DOD will not be able to leverage commercial investment in lasers if this line stays. The Navy is currently putting laser weapons on ships as a trial, but the lasers were developed for commercial use. I wonder if the navy would be allowed to do this if this line holds. IPG might refuse to sell the lasers to DOD. Certainly their commercial business is much larger, and more profitable, than their military business.

To: DDTCPublicComments
Subject: Question concerning Cat XII (c) proposed rule
Date: Tuesday, June 02, 2015 8:35:54 PM

Hello,

I am preparing comments for submission to State in response to the Proposed Cate XII revisions.

Specifically, I have two questions on the coverage of XII (c)(7) and (c)(8) as proposed. The title of XII indicates that Infrared Focal Plane Arrays are controlled therin. In fact, most items in Category XII (c) specifically reference infrared focal plane arrays (IRFPAs); items (c)(7) and (c)(8) are notable in that they do not. Is this as intended, or should reference to IRFPAs be made in items (7) and (8)? If an FPA used available light (not infrared) would it be "enumerated" in (7) and (8)?

The second question concerns the definition of "avalanche detector elements" in (c)(8). Does the word ELEMENTS refer to pixels of an image sensor? Do you have a working definition of avalanche detector elements?

I am working on preparing comments, and it would be helpful to have some clarity on this soon.

Thank you in advance.

Subject: ITAR Amendment - Category XII, RIN 1400-AD32 (Public Notice 9110)

Dear Sir/Madam,

FLIR Systems, Inc. (FLIR) is providing this document in response to the proposed revision of Category XII of the ITAR. FLIR is a world leader in the design, manufacture, and marketing of sensor systems that enhance perception and awareness. FLIR's advanced thermal imaging and threat detection systems are used for a wide variety of imaging, thermography, and security applications, including airborne and ground-based surveillance, condition monitoring, research and development, manufacturing process control, search and rescue, drug interdiction, navigation, transportation safety, border and maritime patrol, and environmental monitoring. FLIR has annual revenues of approximately $1.5B with over half of that revenue generated by sales outside of the U.S. Category XII of the ITAR has the potential to have a significant impact on the sales of FLIR's products.

TOP LEVEL COMMENT

As part of the Administration's Export Control Reform (ECR) Initiative, the rewrite of USML category XII and the companion revisions to the EAR was to establish a "bright line" between items on the USML and the Commerce Control List (CCL) by describing more precisely the articles warranting control on the USML. The objective of ECR is to protect and enhance US national security interests which includes strengthening the US industrial base. Taken together however, the proposed revision of USML Category XII and the related EAR changes would place items in normal commercial use on the USML and impose greater restrictions on items on the CCL. Over-control, as proposed in the two rules, will provide incentive for foreign customers to seek foreign, rather than US products. In the short term this reduces US control and visibility over commercial products that have potential military applications. In the long term, over-control can diminish the US night vision/thermal imaging industrial base by effectively limiting foreign markets, thereby weakening, rather than strengthening the US industrial base.

The Export Control Reform (ECR) initiative was launched with the expressed purpose of building higher walls around fewer items. This was meant to focus resources toward the most significant technologies, while enhancing our industrial base by reducing incentives for foreign manufacturers to "design-out" US-origin components in order to avoid ITAR (i.e., incorporation of ITAR components change the nature of foreign manufactured end-items from dual-use to US ITAR controlled). The ECR also had the expressed purpose of setting straightforward guidelines that would not take a team of lawyers to understand. This proposed rule is considerably more complex than the current rule and even more expansive. In FLIR's experience, US Government export regulations have driven high-tech jobs abroad and have weakened US company's ability to compete in the global marketplace. In contrast to all the other revised categories, these proposed rules do not move lower-level items that are clearly military to the CCL. Instead, they explicitly propose to place items that are in normal commercial use on the USML and impose more restrictive controls on the items proposed to remain on the CCL.

FLIR is greatly concerned that the proposal for Category XII does not reflect the expressed purpose of the ECR. The proposed draft for Category XII fails for several reasons as listed below.

- Commercial markets dominate sales of many technologies described in the Category XII draft
- Foreign availability is not adequately considered
- Actual military items are not specified in the proposal.

Therefore, FLIR recommends that these proposed rules be fundamentally rewritten after thorough and sincere collaboration with stakeholders among industry, USG, and research institutes. Now that there is a definition of "specially designed," use of this as a control parameter would be a simple and effective way to implement the principle of ECR in USML Category XII and the corresponding revisions to the EAR. If the USG continues to seek to identify technical parameters for the revised USML and EAR, using "specially designed" as the principle would achieve the ECR objectives. The broad criteria proposed are based on limits of today's commercial performance for these items rather than defining parameters of military significance. The proposal for Category XII would regulate companies to performance parameters that are simply at the edge of today's commercial market, as opposed to defining parameters of military sensitive items. The proposed approach allows for no future growth in these rapidly advancing technology areas in commercial and consumer markets. Furthermore, it will disincentivize investment by U.S. companies in emerging technology and markets.

Moreover, the proposed revisions to the USML and the EAR are inconsistent with the controls in the Wassenaar Arrangement. The USML should also align with the internationally agreed upon Wassenaar Munitions List. Commodities and components not specially designed for military purposes or on the Wassenaar Dual-Use List should be controlled under the Commerce Control List (CCL). Though still controlled under the CCL, the list controlled by the Department of Commerce allows for more flexibility on how controls are applied, and can adjust to conditions more quickly than items under the USML. EAR controls that are more restrictive than the Wassenaar Dual-Use List and the license-free treatment of Wassenaar Dual-Use items within the European Union and other allied trading partners, will further disadvantage US companies for the smaller portion of the commercial market proposed for the CCL under these rules.

This proposed EAR companion rule is equally confusing and difficult to navigate. Certain articles have greater restrictions applied without apparent logic (6A002 items have more restrictions than 6A003 items). This proposed rule places excessive increased controls on exports of dual-use products to Canada, which is a radical departure from the vast majority of items subject to the EAR. Placing greater restrictions on license exceptions such as STA, APR, and TSR is in direct conflict with the ECR objectives and result in the need to obtain more export licenses. There are numerous changes that mostly increase controls and complicate the process.

These proposed rules are not simplifying the regulations and in fact, this will be a boon to the trade compliance legal community as it will be very difficult to gain an understanding of these changes and implement process changes without specialized legal consultation. It will be particularly burdensome for small businesses as they attempt to understand the rules and may not have the resources to hire the required specialized trade compliance legal experts. This will result in demotivating companies from entering global markets and has a spiraling effect to weaken US companies and strengthen foreign competitors.

SPECIFIC COMMENTS

This document will address most of the major sections of Category XII as FLIR designs, manufactures, and markets a wide variety of products that are based on technology that could be controlled by this category.

Request For Comments (note: the questions are shortened in the responses below)

The Public Notice document requested input on seven questions. Following are responses to those questions.

1) ***The Public is asked to identify any potential lack of coverage between the Wassenaar ML (W-ML) and Wassenaar Dual-Use List (W-DUL) as a result of the Category XII (Cat XII) proposal.***

RESPONSE: FLIR is not aware of any areas that lack coverage that need to be controlled.

2) ***The Public is asked to identify any items proposed for control on the USML that are not controlled on the Wassenaar ML or DUL.***

RESPONSE:

a. Readout Integrated Circuits (ROICs) as described in (e)(4) and (e)(5) are not controlled on the W-ML or the W-DUL. In fact the Wassenaar specifically rejected a 2007 U.S.G. WA proposal to add ROICs to the M-DUL. This will be discussed in more detail in this document in the (e) section responses.
b. 6A993 products are not controlled by the W-DUL or the W-ML. This rule proposes to place controls on 6A993 products that may be incorporated into military products, which is a low-probability scenario. Further, if 6A993 products are incorporated into "true" military items, the military utility is very limited due to the "slow video" related to 6A993 articles.

3) ***The Public is asked to provide examples of control criteria that do not establish a bright line between the USML and the CCL.***

RESPONSE: There are multiple examples with specific information in this document that identify the lack of a bright line between USML and CCL items.

4) ***The stated goal of Export Control Reform (ECR) is to only control items on the ITAR that are not in normal commercial use or to assure that only items that provide the U.S. government with a critical military or intelligence advantage. The Public is asked to provide specific examples of commercial use as well as data related to foreign availability of such items.***

RESPONSE: There are numerous examples of items listed in the proposed CAT XII that are in commercial use and available world-wide.

a. Lasers covered in paragraph (b)
b. Cooled and Uncooled focal plane arrays, cameras incorporating cooled and uncooled focal plane arrays, IRFPA integrated dewar cooler assemblies (IDCAs), Gimbals, camera cores (with no shock specification), Binoculars, imaging systems, cryo-coolers, optics, electronic assemblies, ROICs and many more items.

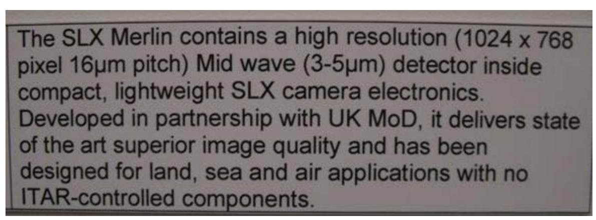
5) ***The Public is asked to identify parameters that are unique to military users.***

RESPONSE: Where applicable or possible, military performance parameters will be identified. However, there is a basic flaw with this proposed language in trying to identify military parameters on items that are inherently dual-use. For example, infrared focal plane arrays (IRFPA) are typically designed to a general performance standard and it isn't until the IRFPA is installed into a higher-level system that the militarization occurs. The same IRFPA may be installed in a commercial thermography camera that is also installed into a thermal weapon sight.

6) ***The Public is asked to comment on the consequences of controlling items on the USML when they are also controlled on the W-DUL.***

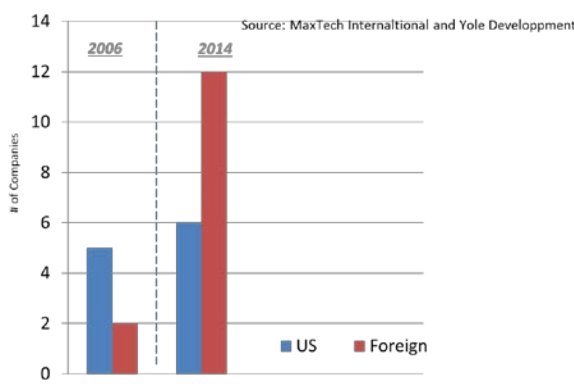
RESPONSE: This document will discuss the foreign availability of many of the items listed on the proposed CAT XII. Later in this document we will make clear that IRFPA technology is widely available world-wide including from credible manufacturing facilities located in the EU, Middle East, and Asia (including China). Further, third party market data will be shown that demonstrates that commercial applications for uncooled products outnumber military applications by 4 to 1 world-wide. Additionally, market research data identifies that over half of all cooled detectors and products are produced outside of the U.S.

It is no surprise that given a choice for equal performance, that non-US camera and system manufacturers will choose to integrate dual-use products manufactured outside of the U.S. over products that are ITAR controlled. Many non-US manufacturers of products that incorporate IRFPAs advertise their products as "ITAR-FREE" as shown by the example of a statement made by Selex ES below. This situation places U.S. manufacturers of thermal imaging components and systems at a distinct disadvantage in the ability to compete in the global market place. Figure 1 shows the significant number of non-U.S. manufacturers of uncooled detectors that have entered the market over the last decade. These Non-U.S. detector manufacturers have relatively quickly developed manufacturing capability and are producing advanced technology.



The SLX Merlin contains a high resolution (1024 x 768 pixel 16µm pitch) Mid wave (3-5µm) detector inside compact, lightweight SLX camera electronics. Developed in partnership with UK MoD, it delivers state of the art superior image quality and has been designed for land, sea and air applications with no ITAR-controlled components.

Figure 1 **The Number of Foreign UFPA Production Manufacturing Facilities Is Increasing Dramatically**



The Number and technical sophistication of foreign UFPA manufacturers has increased and will continue to do so as foreign firms take advantage of ITAR export restrictions on U.S. manufacturers. Figure 2 is a table showing by country, Microbolometer IRFPA technology currently being manufactured.

Figure 2 Companies Producing Microbolometer IRFPAs

	Number of Companies Producing Microbolometer IRFPAs								
					Source: MaxTech International				
	U.S	Japan	Israel	China	Canada	France	Germany	Korea	Turkey
Material Type									
Vanadium Oxide (VOx)	5	1	1	2	2				
Amorphous Silicon (a-Si)	1			2		1	1		
Silicon-on-Insulator (SOI)		2						1	
Titanium Oxide (TiOx)								1	
Various Uncooled Technologies				1				1	1
	6	3	1	5	2	1	1	3	1

7) ***The Public is asked to comment on several new concepts introduced in the CAT XII proposed draft***

RESPONSE:

a. Refer to (c)(2) for comments regarding using integration of an IRFPA into a package as a control parameter.
b. Refer to (c)(12) for comments regarding using integration of an IRFPA into a camera as a control parameter. And the definition of camera core proposed in the note to (c)12
c. Refer to (c)(12)(ii) for comments regarding the weapon shock load control criteria
d. Refer to (f) for comments on the proposed controls on technical data.

SPECIFIC COMMENTS TO CAT XII

(a) Fire control, weapons sights, aiming, and imaging systems and equipment, as follows:
(2) Weapon sights, weapon aiming systems or equipment, and weapon imaging systems or equipment (e.g., clip-on), with or without an integrated viewer, display, or reticle, and incorporating or specially designed to incorporate any of the following:
(i) An infrared focal plane array having a peak response at a wavelength exceeding 1,000 nm;

ISSUE: There is no distinction between “civil” weapon sights and “military” weapon sites. No military parameters are identified.

1) There are weapon sights that were specifically developed for hunters and non-military end-users.
    a. Amrasight, Zeus Pro, US http://www.armasight.com/thermal-imaging/thermal-weapon-sights/armasight-zeus-pro-336-8-32x100-60-hz
    b. FLIR, R-Series, US http://flir.com/thermoSightR-Series/
2) There are civil weapon sights available from non-US sources.
    a. General Starlight, Canada

http://www.nvoptics.com/gsci%20thermal%20imaging/thermal-imaging-systems.html

i. A note in their section regarding exports: GSCI is Canadian-owned and based company. This means that our Customers enjoy: 1. Low, "North American" prices and 2. ITAR free products, that are easily available for export. *Canada Customs export control applies, please ask us for a free consultation.

b. Pulsar, Lithuania. http://www.pulsar-nv.com/products/thermal-imaging-sights-apex/apex-xd75/

3) There are features unique to civil users as explained in this Buyers guide to help consumers purchase thermal weapon sights. http://www.nvoptics.com/documents/The%20Ultimate%20Guide%20Final_WEB.pdf
4) Weapon sights developed and used by military end-users have specific performance and environmental requirements. The US DOD is not likely to purchase these "civil" sights.

RECOMMENDATION: specify a military performance parameter or add the term "specially designed for military end-uses" to this section. Consider the export controls for civil devices applied by Wassenaar and implement similar controls for US origin products.

(b) Lasers, and laser systems and equipment, as follows:

(b)(3) Laser rangefinders having any of the following:
(b)(3)(i) Q-switched laser pulse; or
(b)(3)(ii) Laser output wavelength exceeding 1,000 nm;

ISSUE:

1) Rangefinders capable of 2^{+} km performance typically conflict with both of these requirements in (b)(3)(i) and (ii). Rangefinders for common sporting applications have performance < 2km and will be captured by the proposed controls.
2) The processes for creating a Q-switched laser pulse and for a device with a wavelength > 1000 nm are well known and widely documented.
   a. Q-Switched laser pulse: implies rangefinders operating under well-known principles of time of flight of single laser pulse
   b. Wavelength over 1000 nm: Rangefinder wavelengths are commonly between 1500 – 1600 nm due to eye-safety considerations as well as common laser technologies to generate these wavelengths
3) Rangefinder devices utilizing both of these principles are readily available for purchase off-the-shelf from foreign sources
4) The proposed language will prevent domestic companies from competing against these foreign companies for non-US markets
5) Rangefinders have non-military applications: Determination of flight altitudes / aircraft height, border monitoring systems, surveying, mapping, construction, non-military aviation and transportation, position determination of moving targets, law enforcement, etc.

Non-US Sources:

1) Cassidian (France) - formerly Zeiss (Germany) : LP16, LP17, LP18, LP19, 1540 nm; Er:glass Q-Switched laser20km capabilities; diode and lamp pumped; > 1Hz capabilities http://www.idssi.com/products/lrf/lp/default.aspx#.VYiQ2kbxTP0
2) Jenoptik (Germany): ELEM, ELEM-DP 1540 nm; Er:glass Q-Switched laser 20km capabilities; diode and lamp pumped; 10Hz capabilities

8) Noptel (Finland): LRF-200, LRF-240, LRF-500, LRF-750, 1550 nm; direct diode. 20km capabilities; 10Hz
http://www.noptel.fi/eng2/LongDistance/index.php?doc=6_downloads/3_brochures

RECOMMENDATION: specify a military performance parameter or add the term “specially designed for military end-uses” to this section.

(8) LIDAR, LADAR, or other laser range-gated systems or equipment, as follows (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km):

ISSUE: The articles described in this section are available from non-US sources. The parameters are very broad.

1) Riegl (Austria): LMS-Q780, LMS-Q1560, 1064 nm
Both appear to be capable of wire detection (12-b-8-ii)
http://www.riegl.com/nc/products/airborne-scanning/
2) Airborne Hydrography AB (Sweden): HawkEye III “Infrared”. May be capable of wire detection (12-b-8-ii)
http://www.airbornehydro.com/hawkeye-iii
3) Leica Geosystems (Switzerland): ALS80. May be capable of wire detection (12-b-8-ii)
http://www.leica-geosystems.us/en/Airborne-LIDAR_86814.htm
4) Teledyne Optech (Canada): Orion, Galaxy, Pegasus. 1541 nm, 1064 nm
“Coupled with exceptional small target detection capability, Orion C provides complete collection confidence of all overflown transmission and distribution lines, irrespective of cable size and coatings.” (12-b-8-ii, possibly 12-b-8-i)
http://www.teledyneoptech.com/index.php/products/airborne-survey/lidar-systems/
5) Elbit Systems (Israel): Sword. “Obstacle Warning System” for helicopters
Limited information on website, but may include wire detection (12-b-8-ii)
Likely adaptable to military ground vehicles (12-b-8-vi)

http://www.elbitsystems-us.com/airborne-solutions/products-sub-systems/obstacle-detection-and-avoidance

RECOMMENDATION: Coordinate the control of articles in this section with the Wassenaar Munitions List.

(c) Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:

ISSUE: The definitions for the various types of components are confusing and appear to be a "catch all." For example the following terms are used;
IRFPA, Photon Detector, microbolometer detector, multi-spectral infrared focal plane array (IRFPA), one-dimensional photon detector IRFPA, two-dimensional photon detector IRFPA, microbolometer IRFPA, charge multiplication focal plane arrays, charge multiplication IRFPA. What is Night Vision? What are accessories? What is the difference between a camera and a core?

RECOMMENDATION: Establish clear definitions and names and use the names consistently throughout the document.

(C)(2) Photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm and not integrated into a permanent encapsulated sensor assembly, and detector elements therefor;

ISSUE: The concept of a permanent encapsulated sensor assembly is 1) not well defined and 2) is not a bright line parameter to distinguish an ITAR item from a CCL item.

IRFPAs are packaged using various methods depending on the type of detector. Microbolometer IRFPAs/detectors are typically packaged in a sealed vacuum device. Photon detector IRFPAs may be packaged in different methods depending on many factors. A photon detector may eventually become packaged in a sealed vacuum assembly however; those steps have little to do with whether the device is military in nature. It's not clear why the "permanent encapsulated sensor assembly" is used as a military parameter. One can speculate that the USG is concerned about either reverse engineering of IRFPAs, diversion of IRFPAs, or both.

Permanent encapsulation will not eliminate reverse engineering by an entity that is knowledgeable, funded and motivated. However, reverse engineering is a concern for all technologies and companies such as FLIR institute extensive measures to protect intellectual property.

The motivation to purchase a camera assembly with the purpose to remove the IRFPA for diversion into a military system isn't practical. The availability of IRFPAs world-wide and the extra cost of purchasing a camera to harvest the IRFPA then dispose of the camera assembly isn't cost effective or practical on any type of a large scale basis. It is possible that there might be a one-off situation where an IRFPA is removed from a commercial camera, but it is unlikely to occur in volume.

In summary, FLIR is concerned that the encapsulation of an IRFPA is being used as a distinguishing parameter for a military item, which has no bearing on its military utility. Further, we are concerned that the definition of a permanent encapsulation sensor assembly is not sufficiently defined.

RECOMMENDATION: Remove this packaging concept as criteria for distinguishing a military item and add language that CAT XII will control FPAs specially designed for military applications.

> ***Note 1 to paragraph (c)(2): This paragraph does not control lead sulfide or lead selenide IRFPAs having a peak response within the wavelength range exceeding 1,000 nm but not exceeding 5,000 nm and not exceeding 16 detector elements, or pyrolectric IRFPAs with detectors composed of any of the following or their variants: triglycine sulphate, lead-lanthanum zirconium titanate, lithium tantalite, polyvinylidene fluoride, or strontium barium niobate.***

ISSUE: This exclusion seems designed to allow lower performance solutions. However, this note is lacking clear performance parameters but instead specifies detector materials deemed to not be relevant for military uses. FLIR's concern is that, as various detector materials mature, performance is likely to improve and yet the devices won't be controlled. This phenomenon may actually drive sensor material development efforts by organizations wishing to avoid ITAR controls. As an example, prior to 2005 amorphous silicon (a-Si) was not export controlled by the US or by Wassenaar. However, over time a-Si performance improved such that its performance became equal to other microbolometer materials such as vanadium oxide (VOX). In 2003 - 2005, the US DOD expended significant and successful effort to place controls on a-Si FPAs at the Wassenaar level as acknowledgment that a-Si performance improved[1]. We believe excluding certain detector materials as per this proposal will have a similar outcome and does not acknowledge that various detector materials mature over time.

RECOMMENDATION: It is not possible to establish performance parameters relevant to military requirements. Currently, only pixel count is established as a military parameter. However, the pixel count "bright line" for US controls has been exceeded by non-US sources and these foreign manufactured large FPAs are being incorporated into non-military systems. Focal plane arrays should be ITAR controlled ONLY when specially designed for military applications.

Note 2 to paragraph (c)(2): For controls on readout integrated circuits (ROICs), see paragraphs (e)(4) and (e)(5) of this category.

ISSUE: NOTE 2 to paragraph (c)(2) should not be in this section. ROICs are addressed in section (e). Referencing ROICs in section (c) is confusing as there are potentially many other components that could also be referenced in this section and it's not clear why ROICs are highlighted.

RECOMMENDATION: Remove Note 2 since it only adds to confusion related to navigating the CAT XII.

> ***(C)(3) One-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly, having greater than 640 detector elements;***

ISSUE: One-dimensional photon detector IRFPAs with greater than 640 detector elements are available from non-US sources. Placing ITAR controls on items that are in commercial use and available from

[1] FRN Vol. 70, 135 / July 15, 2005. Several key changes were made by this notice; a-Si Detectors were controlled, and the definition of a camera, the automotive exception, and the 9Hz exclusion were all implemented.

foreign sources is in conflict with the ECR guiding principles. Many one-dimensional photon IRFPAs are used for non-military telecommunication and spectroscopy applications.

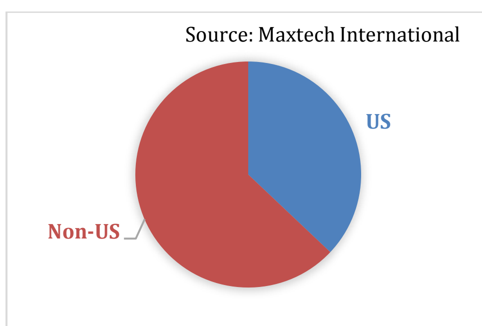
1) The number of detector elements is not a criterion that delineates dual-use and military one-dimensional photon detector IRFPAs
2) The detector is a dual-use device
3) The pixel count constraint has no specific military significance
4) Similar devices are listed on the Wassenaar DUL and not on the Wassenaar "Munitions List." Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
5) There are foreign available dual-use products, for example:
    a. Xenics Xlin-17-3000 http://www.xenics.com/en/xlin-17-3000
    b. Hamamatsu http://www.hamamatsu.com/jp/en/product/category/3100/4005/4208/4121/index.html

RECOMMENDATION: Remove one-dimensional photon IRFPAs from the list, specify a military performance parameter, or add the term "specially designed for military end-uses" to this section.

(C)(4) Two-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly, having greater than 256 detector elements;

ISSUE: Two-dimensional photon IRFPAs are widely available world-wide. According to the market analysis data from Maxtech International[2], nearly two-thirds of military IRFPAs consumed worldwide are made by non-US suppliers (mainly based in France, Israel, the UK and Germany, but also in Sweden, South Korea and China). See Figure 3.

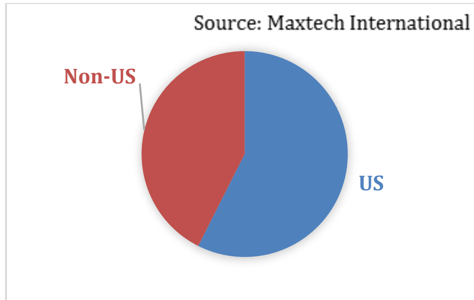
Figure 3 **Cooled IRFPA sources for military applications (US vs. Non-US)**



2 Maxtech International, has specialized in analyzing worldwide infrared markets for over the last 25 years. This company makes regular site visits to all suppliers of infrared detectors worldwide and publishes a series of market research reports on commercial, dual-use, and military infrared markets. These reports have been purchased by most major suppliers of infrared detectors and systems, as well as the U.S. Army. In addition, Maxtech has carried out a major capabilities analysis of infrared detector manufacturers for the U.S. Air Force.

Almost half of all commercial and dual-use applications for photon IRFPAs are being satisfied by non-US suppliers of cooled IRFPAs. See Figure 4.

Figure 4 **Cooled IRFPA sources for COMMERCIAL applications (US vs. Non-US)**



It should be noted that Wassenaar controls many "cooled camera cores" and integrated IRFPA dewar cooler assemblies (IDCA) as 6.A.3.b.4.a dual-use items unless specifically designed for military applications. This is relevant to item 4) in the Request for Comments which states that the US Government does not want to inadvertently control items on the ITAR that are in normal commercial use. The Request for Comments also states that only items that provide the US with critical military or intelligence advantage should be controlled by the ITAR. Since these items are in normal commercial use and due to the significant market share of the non-US manufacturers, these items are not unique to the US.

Non-US Sources

4) Selix, UK. 1280x720 MCT http://www.selex-es.com/product-portfolio/optronics-system/thermal-detectors
5) IR Nova, Sweden. 640x480 T2SL FPAs. http://www.ir-nova.se/products-mwir/

RECOMMENDATION: Remove two-dimensional photon IRFPAs from CAT XII, or specify a military performance parameter, or add the term "specially designed for military end-uses" to this section.

(c)(5) Microbolometer IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly, having greater than 328,000 detector elements;

ISSUE: Microbolometer IRFPAs in a permanent encapsulated assembly having greater than 328,000 elements are available from multiple non-US sources and are integrated into non-military products. Figure 1 highlights the significant number of Non-US UFPA manufacturers that have entered the market over the last decade.

Figure 5 Commercial vs. Military UFPA Market (Worldwide)

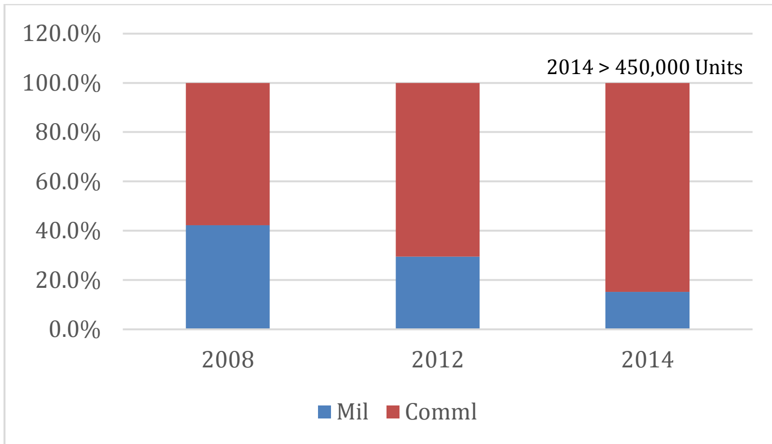

Figure 5 emphasizes the continued growth of the commercial market for Microbolometer IRFPAs and products and it also highlights that commercial sales far exceed military sales.[3] Further, it's relevant to note that the Maxtech 2014 data shows that the number of UFPA devices manufactured world-wide increased by over 40% between 2013 and 2014. This growth in units manufactured is driven by the increasing commercial demand for uncooled technology. Figure 6 provides a view of the markets that are expanding world-wide. Further, it is clear from this data that the requirements by the military for uncooled Microbolometer IRFPAs represents a fraction of the demand and promises little growth.

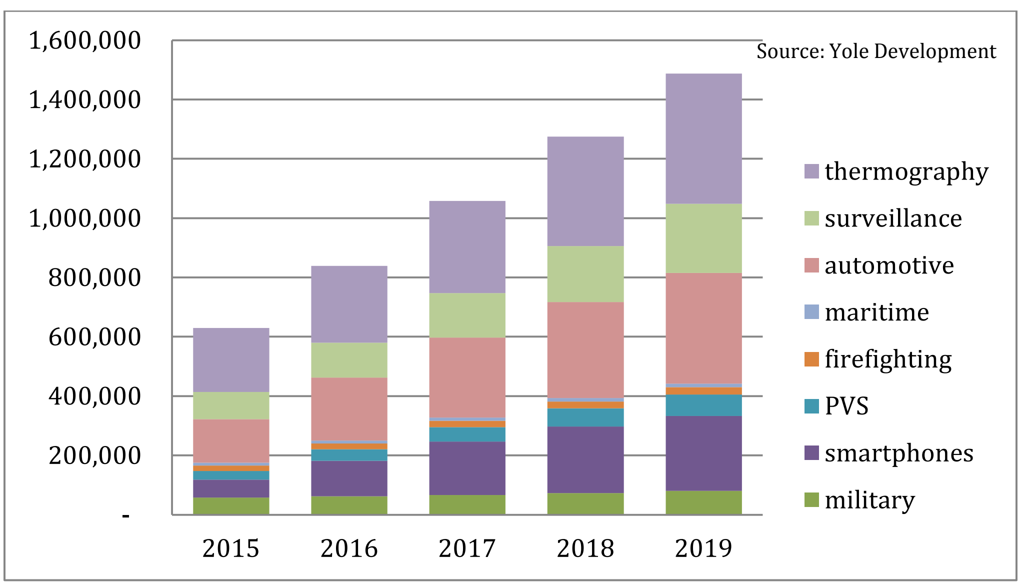
Figure 6 UFPA Camera Forecast by Market



[3] Data shown in Figures 2, 3, 4 and 5 is from Maxtech International 2015 Report "The World Market for Commercial and Dual-Use Infrared Imaging and Infrared Thermometry Equipment"

Placing ITAR controls on items that are in commercial use and available from non-US sources is contrary to the ECR guiding principles. The consequences of controlling this technology under the ITAR will be devastating to the US manufacturing base as OEMs will choose to source UFPAs from companies that are not encumbered by ITAR controls.

Performance is rapidly improving and commercial manufacturing techniques such as wafer-level-packaging and pixel-level-packaging, are greatly reducing manufacturing costs and reducing prices of IRFPAs. Much of this innovation is driven from commercial demand rather than military requirements. As shown above in Figures 1 and 2 a growing number of the commercial manufacturers are non-US companies. Placing ITAR controls on dual-use technology will have the unintended effect of strengthening non-US companies at the expense of US manufacturers. Overseas customers will avoid ITAR controls by turning to those offshore producers; US producers will lose economies of scale, and in the end America's military will become dependent on non-US sources for this vital technology. The US Satellite and LCD industries are examples of exactly this situation occurring which resulted in the product development and manufacturing efficiencies and expertise moving outside of the US.

Non-US Sources:

1) Semi-Conductor Devices (SCD), Israel, 1024 x 768 VOX http://www.scdusa-ir.com/bird-xga/
2) ULIS, France, Pico 1024 x 768 a-Si UFPA. http://www.ulis-ir.com/index.php?infrared-detector=gen2pico1024
3) North Guang Wei Technologies (GWIC), China, 640x480 VOX microbolometers. http://www.gwic.com.cn/en_productdetail.html?id=21
4) Dali, China 640x480 a:Si UFPA. http://www.dali-tech.us/products/dlc640-60.html
5) i3 Systems, Korea. http://www.i3system.com/eng/n_product/product101.html

RECOMMENDATION: Remove Microbolometer IRFPAs from the ITAR and place control of the products and technology under the Department of Commerce (DOC) Export Administration Regulations (EAR). This will match the controls implemented by the Wassenaar DUL. It really is not possible to identify performance parameters that are strictly military for Microbolometer IRFPAs. The militarization occurs once the device is integrated into a higher level assembly which has been specially designed for military applications.

(c)(6) Multispectral IRFPAs in a permanent encapsulated sensor assembly, having a peak response in any spectral band within the wavelength range exceeding 1,500 nm but not exceeding 30,000 nm;

ISSUE: There are DOD programs like iFLIR using the Dewar Cooler Bench (DCB) with the Variable Aperture Coldshield which are clearly ITAR. However, devices and systems for this program will be "specifically designed for mil use" and not used commercially.

RECOMMENDATION: specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(9) Integrated IRFPA dewar cooler assemblies (IDCAs), with or without an IRFPA, having any of the following:

ISSUE: This language doesn't acknowledge foreign availability from Semi-Conductor Devices (SCD) in Israel, Sofradir in France, AIM in Germany and other sources in Asia. Additionally there are no suggested or intended use restrictions or performance restrictions to allow for the growing number of commercial applications of this technology.

Foreign Availability:

1) Sofradir has a large family of IDCAs available on a commercial basis. http://www.sofradir.com/category_product/mwir-detectors/
2) Wuhan JoJo Technology, China. http://johotek01.en.made-in-china.com/product/HqanJQLcaCVd/China-Mwir-Cooled-Thermal-Imaging-Module.html
3) Selex ES cooled MWIR IDCA http://www.selex-es.com/-/erica_ff-1
4) AIM HiPIR 640 MWIR IDCA http://www.aim-ir.com/en/main/products/modules.html
5) I3 Systems, S. Korea, 640 InSb and MCT IDCAs. http://www.i3system.com/eng/n_product/product101.html
6) SCD, Israel, large family of InSb IDCAs. http://www.scd.co.il/

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(9)(i) Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours;

ISSUE: Cryocoolers are widely available from non-US sources and are in normal commercial use. Restriction on 218K temp and 3000 hours doesn't acknowledge foreign availability from AIM, Thales, Ricor (Israel), and companies in China and Korea. Reference section (e)(7)(i) for a list of cryocoolers available from non-US sources

RECOMMENDATION: Remove cryocoolers from the ITAR unless specially designed for military end-uses.

(c)(9)(ii) Active cold fingers;

ISSUE: All IDCAs have active cold fingers.

RECOMMENDATION: Remove from the ITAR unless specially designed for military end-uses.

(c)(9)(iv) Dewars specially designed for articles controlled in paragraphs (a), (b), or (c) of this category;

ISSUE: As stated above, many items proposed for control in (a), (b), and (c) are dual-use items. Controlling all dewars as ITAR items when they are not designed for military applications will be overly restrictive.

RECOMMENDATION: Remove from the ITAR unless specially designed for military end-uses.

(c)(10) Gimbals with two or more axes of active stabilization having a minimum root-mean-square (RMS) stabilization better (less) than 200 microradians, and specially designed for articles controlled in this

subchapter;

ISSUE: Stabilization is not a military parameter.

1) Critical military parameters are a combination of objectives for a given mission.
    a. The ability to detect, recognize, and identify certain objects at specified ranges
    b. Features such as laser designators used to direct weapons
    c. Type of platform e.g., UAV, fixed wing, rotary, high speed crafts
2) Gimbals are used for many non-military end-uses
    a. Agricultural
    b. Power line monitoring
    c. Search and rescue
    d. Law enforcement
3) There is extensive availability from non-US sources
    a. Wescam, extensive range of airborne stabilized platforms. http://www.wescam.com/index.php/products-services/airborne-surveillance-and-reconnaissance/
    b. PV Labs, extensive range of airborne stabilizied platforms, advertise "ITAR FREE", Canada http://www.pv-labs.com/
    c. Controp, extensive range of airborne stabilized platforms, Israel http://www.controp.com/category/long-range-payloads
    d. SWESystems, airborne stabilized platforms, Sweden http://www.swesystem.se/assets/300-triple---produktblad.pdf
    e. Airbus, France/South Africa http://www.defenceandsecurity-airbusds.com/en_US/web/guest/leo_iii_hd
    f. Safran, extensive range of airborne platforms, France http://www.sagem.com/aerospace/helicopters/airborne-optronics-helicopters/electro-optical-systems-eos

RECOMMENDTION: Specify military performance parameters, or military specific features such as laser designation for weapons, or add the term "specially designed for military end-uses" to this section.

(c)(11) Gimbals with two or more axes of active stabilization having a minimum root-mean-square (RMS) stabilization better (less) than 100 microradians;

ISSUE: Stabilization is not a military parameter.

1) Critical military parameters are a combination of objectives for a given mission.
    a. The ability to detect, recognize, and identify certain objects at specified ranges
    b. Features such as laser designators used to direct weapons
    c. Type of platform e.g., UAV, fixed wing, rotary, high speed crafts
2) Gimbals are used for many non-military end-uses
    a. Agricultural
    b. Power line monitoring
    c. Search and rescue
    d. Law enforcement
3) There is extensive availability from non-US sources

a. Wescam, extensive range of airborne stabilized platforms. http://www.wescam.com/index.php/products-services/airborne-surveillance-and-reconnaissance/
b. PV Labs, extensive range of airborne stabilizied platforms, advertise “ITAR FREE”, Canada http://www.pv-labs.com/
c. Controp, extensive range of airborne stabilized platforms, Israel http://www.controp.com/category/long-range-payloads
d. SWESystems, airborne stabilized platforms, Sweden http://www.swesystem.se/assets/300-triple---produktblad.pdf
e. Airbus, France/South Africa http://www.defenceandsecurity-airbusds.com/en_US/web/guest/leo_iii_hd
f. Safran, extensive range of airborne platforms, France http://www.sagem.com/aerospace/helicopters/airborne-optronics-helicopters/electro-optical-systems-eos
g. IAI, extensive range of airborne stabilized platforms, Israel http://www.iai.co.il/Sip_Storage//FILES/5/41025.pdf

RECOMMENDTION: Specify military performance parameters, or military specific features such as laser designation for weapons, or add the term “specially designed for military end-uses” to this section.

Note to paragraph (c)(11): This paragraph does not control gimbals containing only a non-removable camera payload operating exclusively in the visible spectrum (i.e., 400 nm to 760nm)

ISSUE: The intent is not clear. Rather than specify a technology, i.e., visible cameras, the intended end-use or performance parameter must be identified. It is possible that a visible camera could be used for a military end-use depending on other factors. This language will control television broadcast cameras installed in gimbals used for traffic monitoring or filming.
There are commercially available systems from non-US companies which have interchangeable cameras. Interchangeability of cameras is a common requirement and avoids the need for a filming company or local news channel from acquiring multiple gimbal systems rather than a system with interchangeability options.

1) Dynamic Perspective, Broadcast platforms Switzerland http://dynamicperspective.com/dynax5/overview/
2) SWESystems, Broadcast platforms Sweden. http://www.swesystem.se/broadcast.html
3) Shotover, 6-axis stabilized platforms, New Zealand. Advertise “NO ITAR or EAR Controls” http://www.shotover.com/k1

RECOMMENDATION: Remove this note and provide military parameters in (c)(10) and (c)(11).

(c)(12) Infrared imaging camera cores (e.g., modules, engines, kits), and specially designed electronics and optics therefor, having any of the following:

ISSUE: There are multiple concerns with this language; definitions are required and the reference to electronics and optics is confusing in this section. Optics and electronics are covered under section (e) Components and therefore it isn’t logical to list just a couple of components in this section.

The definition of "infrared imaging camera cores" is not clear. The Note to paragraph (c)12 states: *The articles controlled by this paragraph have sufficient electronics to enable as a minimum the output of an analog or digital signal once power is applied.* This definition is very similar to the definition of camera in the EAR. Note 1 to 6A003.b states: *Imaging cameras described in 6A003.b.4 include "focal plane arrays" combined with sufficient "signal processing" electronics, beyond the read out integrated circuit, to enable as a minimum the output of an analog or digital signal once power is supplied.*

The EAR definition of Imaging Camera has been in place and implemented as a term understood by industry and confirmed through the State Department Commodity Jurisdiction (CJ) process. The Wassenaar DUL has also adopted the EAR definition for Imaging Camera. The CAT XII term introduces new terms called "cores, modules, engines, and kits" however, the CAT XII definition for "infrared imaging camera cores" appears to be the same as the EAR definition for "Imaging Camera."

It is not clear why the ITAR is creating a new term called "cores, modules, engines, and kits" rather than use the existing definition of "imaging cameras" used in the EAR and Wassenaar.

RECOMMENDATION: The CAT XII should use definitions for "imaging camera" that are common with the EAR and the Wassenaar.

(c)(12)(ii) Output imagery when subject to more than 20 weapon shock load events of 325g for 0.4 ms and a microbolometer IRFPA having greater than 111,000 detector elements;

ISSUE: This language attempts to restrict the use of a camera with greater than 111,000 detector elements (pixels) from being used for a weapon sight. The concern is that insufficient technical parameters have been identified and that there has been no consideration of foreign availability.

1) The military weapon shock specification for a thermal weapon sight is much more involved than the few parameters listed. This link represents the type of requirements for a military thermal weapon sight as specified for the Squad Thermal Sight (STS) system. https://www.fbo.gov/index?s=opportunity&mode=form&id=d8a51751cb529883b80cb9203299fb1a&tab=core&tabmode=list&=

   Extensive design, testing, and validation must be accomplished in order for a camera to survive the harsh environment of a thermal weapon sight. The STS solicitation is a common example of requirements for cameras integrated into thermal weapon sights and highlights the need for items to be "specially designed" for military applications in order to be considered for purchase by the US Navy.

   a. There are commercial requirements for cameras to survive the shock load that results from normal use of a camera. It is common for consumer thermography and industrial cameras to have a requirement to survive a 2 meter drop test. Underwriter Laboratories (UL) has requirements for consumer and industrial products to survive shock as a result of drop tests. http://ulstandardsinfonet.ul.com/tocs/tocs.asp?fn=0294.toc
   b. Consumer point and shoot cameras and cell phones have shock specifications that exceed the 325g shock load specified in this draft. For example, the Panasonic FT2 consumer camera is tested to MIL-STD 810F Method 516.5- for Shock http://www.dpreview.com/articles/9043332764/panadmcft2#specs. There are many consumer

point and shoot cameras on the market that have been ruggedized to meet the needs of adventure seekers.

c. Thermal imaging cameras (TIC) used for civil firefighters must survive a 2 to 5 meter drop which generate a shock load between 600g's to 1,500g's. NFPA 1801 provides the rigorous testing required for TICs. http://www.nfpa.org/codes-and-standards/document-information pages?mode=code&code=1801. Manufacturers of these systems find that the environmental protections that allow survival of the product during drop tests or extreme heat experienced by firefighters, occurs at the system level. Significant design and testing is required for these cameras to meet the NFPA requirements.

2) There is significant foreign availability of Microbolometer IRFPA imaging cameras that exceed the shock specification as well as the 111,000 pixel limit. Figure 7 lists a sample of cameras available from non-US manufacturers. Numerous manufacturers in the EU produce cameras with 786,000 pixels. Further, there are camera manufacturers in Asia (including China), the EU, the Middle East that commercially provide cameras that exceed the 111,000 pixel count without regard to a shock load specification.

3) This requirement will be a significant deterrent for US companies competing in international markets. Camera customers will be concerned that the drop shock will result in fragile cameras that can't be used in normal commercial/industrial use.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards.

(c)(12)(iii) A microbolometer IRFPA described in paragraph (c)(2) of this category having greater than 328,000 detector elements, or a microbolometer IRFPA described in paragraph (c)(5) of this category;

ISSUE: There are no military parameters listed only number of pixels. As shown in Figure 7, there are cameras available from non-US manufacturers that incorporate Microbolometer IRFPAs with over twice the number of pixels as included in this language. Placing ITAR controls on items that are in commercial use and available from non-US sources is contrary to the ECR guiding principles. The consequences of controlling this technology under the ITAR will be devastating to the US manufacturing base as OEMs will choose to source cameras with Microbolometer IRFPAs from companies that are not encumbered by ITAR controls. Based on the data presented in Figures 5 and 6 there is significant demand forecasted for Microbolometer IRFPA products and US manufacturers must be encouraged, not restricted, from participating in this global market.

RECOMMENDATION: Move control of Microbolometer IRFPAs to the EAR. Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(12)(iv) An IDCA described in paragraph (c)(9) of this category, or IDCA parts or components described in paragraph (e)(7) of this category;

ISSUE: There are no military parameters listed. This proposed language captures dual-use cameras that use IDCAs.

1) IDCAs are widely available from non-US sources as discussed under the comments in (c)(9) above.
2) There are dual-use cooled cameras that are captured by this rule. End-uses for dual-use cooled cameras include: gas imaging, hyperspectral imaging, spectroscopy, and security and surveillance.
3) As with other dual-use items, many of these items are controlled on the Wassenaar DUL and not on the Wassenaar "Munitions List." Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products that incorporate IDCAs, for example:
    a. Opgal Eye-C-Gas http://www.opgal.com/portals/0/pdf/eyecgas_27.11.2012_small.pdf
    b. Telops Hyper-Cam Methane http://www.telops.com/en/hyperspectral-cameras/hyper-cam-methane
    c. Opgal Vumii Sii XR Long Range Thermal Camera http://www.opgal.com/SECURITY/SecurityProducts/ThermalCameras.aspx
    d. Cantronics Cooled Thermal Imaging Security Cameras http://www.cantronics.com/thermal-cameras/144
    e. Thales Suzie Long-Range Thermal Imager (advertises "ITAR Free"). https://www.thalesgroup.com/sites/default/files/asset/document/suzie_a4_en_032014_ref_041a.pdf

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(12)(v) A one-dimensional photon detector IRFPA described in paragraph (c)(2) of this category having a peak response within the wavelength range exceeding 900 nm but not exceeding 2,500 nm and greater than 640 detector elements;

ISSUE: The intended article is not well defined.

RECOMMENDATION: Delete this provision or provide a clear description of the intent.

(c)(12)(vi) A one-dimensional or two-dimensional photon detector IRFPA described in paragraph (c)(2) of this category having a peak response within the wavelength range exceeding 2,500 nm but not exceeding 30,000 nm and greater than 256 detector elements;

ISSUE: The intended article is not well defined.

RECOMMENDATION: Delete this provision or provide a clear description of the intent.

(c)(12) (vii) A one-dimensional photon detector IRFPA described in paragraph (c)(3) of this category;

ISSUE: This rule inadvertently captures dual-use cameras that use one-dimensional photon detector IRFPAs.

1) There are dual-use infrared linescan cameras that are captured by this rule. Applications for linescan cameras include: portable thermography, industrial and scientific R&D, predictive and preventive maintenance, building inspection. Following are examples of dual-use cameras that are captured by the rule:
   a. Sensors Unlimited http://www.sensorsinc.com/products/linescan-cameras/
2) Constraining products based on the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar DUL and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
   b. Xenics Lynx-1024-CL http://www.xenics.com/en/camera/lynx-1024-cl

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(12)(viii) A two-dimensional photon detector IRFPA described in paragraph (c)(2) or (4) of this category having a peak response within the wavelength range exceeding 900 nm but not exceeding 2,500 nm, and greater than 111,000 detector elements

ISSUE: This proposed rule inadvertently captures some dual-use SWIR cameras that use two-dimensional photon detector IRFPAs.

1) There are dual-use infrared InGaAs cameras that are captured by this proposed rule. Applications for dual-use InGaAs cameras include: spectroscopy, semiconductor inspection and

DWDM optical performance monitoring. Examples of dual-use cameras that are captured by the proposed rule include:

   a. Sensors Unlimited Mini SWIR http://www.sensorsinc.com/products/detail/mini-swir-jsx-snapshot-camera-60-fps
   b. FLIR Tau SWIR http://www.flir.com/cores/display/?id=51890

2) Constraining products based on the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar DUL and not on the Wassenaar "Munitions List." Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
   a. Xenics BobCat 640 http://www.xenics.com/en/bobcat-640-gige
   b. Raptor Owl 640 http://www.raptorphotonics.com/product/owl-640-analog-33
   c. SCD InGaAs 640 http://www.scdusa-ir.com/ingaas/

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(C)(12)(ix) A two-dimensional photon detector IRFPA described in paragraph (c)(4) of this category having a peak response within the wavelength range exceeding 2,500 nm but not exceeding 30,000 nm

ISSUE: This proposed rule captures dual-use cooled cameras that use two-dimensional cooled IDCAs.

1) There are dual-use infrared research cameras, gas-imaging and security that are captured by this proposed rule which have received dual-use determinations through the Commodity Jurisdiction process. Applications for infrared research cameras include: Non-destructive testing, manufacturing monitoring, gaseous cloud studies. Applications for gas-imaging cameras include: methane emissions monitoring, leak detection, pollution monitoring, flare measurement, and standoff emission characterization of smokestacks. Applications for security and surveillance include border security and facility monitoring. Following are examples of cameras determined to be dual-use by DDTC that are captured by the proposed rule:
   a. FLIR GF300/320 Infrared Cameras http://www.flir.com/ogi/display/?id=55671
   b. Sofradir EC IRE-320M Camera http://www.thermal-cameras.com/th-mwirs.html
   c. FLIR a6700sc Science Camera. This camera incorporates a 640x480 InSb IDCA. http://www.flir.com/science/display/?id=67022
2) Constraining products based on the pixel count and wave-length has no specific military significance.
3) These items are controlled on the Wassenaar DUL and as 6A003.b.4.a by the Commerce Department. Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices. Confusion will result and the number of CJs will likely increase.
4) There are foreign available dual-use products, for example:
   a. Xenics Onca-LWIR-MCT-384 http://www.xenics.com/en/onca-lwir-mct-384
   b. Telops TX-IR http://www.telops.com/en/infrared-cameras/ts-ir-thermal-scientific-ir-camera
   c. Opgal Vumii Sii XR Long Range Thermal Camera http://www.opgal.com/SECURITY/SecurityProducts/ThermalCameras.aspx

d. Cantronics Cooled Thermal Imaging Security Cameras http://www.cantronics.com/thermal-cameras/144
e. Thales Suzie Long-Range Thermal Imager (advertises "ITAR Free"). https://www.thalesgroup.com/sites/default/files/asset/document/suzie_a4_en_032014_ref_041a.pdf

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(c)(13)(ii) Binoculars, biocculars, monoculars, goggles, or head or helmet-mounted imaging systems or equipment (including video-based articles having a separate near-to-eye display) that incorporate or are specially designed to incorporate any of the following, and specially designed electronics, optics, and displays therefor: An infrared imaging camera core controlled in paragraph (c)(12)(i) through (xi) of this category;

ISSUE: The language in this proposal is very broad and appears to capture commercial thermography cameras, cameras for municipal fire firefighters, and personal vision systems (PVS) designed for outdoor enthusiasts. The Note to paragraph (c)(13) states that any of these devices specially designed to incorporate an IRFPA or IIT will be considered a Defense Article. This is in conflict with the language in (c)(13) where for example, a monocular incorporating a device controlled by (c)(12)(iii) [640x480 Microbolometer] would not be controlled under the ITAR. The following comments assume that the Note specifies the intent of this section.

1) Thermography cameras are specially designed for commercial and industrial applications. The language that states "including video-based articles having a separate near-to-eye display" could be interpreted to include any product with a near-to-eye display. It is common for commercial and industrial cameras to have near-to-eye displays for ease of use.
   a. FLUKE TiX1000 Thermography Camera. http://www.fluke.com/fluke/inen/thermal-cameras/fluke-tix1000.htm?pid=78909
   b. ICI IR640 P-Series http://www.infraredcamerasinc.com/ir-640-p.html
2) Firefighting Cameras. A few products currently exist for helmet mounted firefighting purposes. However, it is expected that in the near future that thermal cameras will be incorporated into firefighters breathing apparatuses and mounted or integrated into firefighter helmets.
   a. Sage Technologies Ltd helmet mounted camera for firefighters. http://gosage.com/HelmetVue.html
   b. Honeywell thermal camera mounting kit for firefighters. https://www.fishersci.com/shop/products/honeywell-fire-warrior-micro-thermal-imager/p-2661888
3) Commercial binoculars, biocculars, monoculars and helmet mounted articles incorporating IRFPAs will be captured by this language.
   a. Pulsar http://www.pulsarnv.com/pl77311.html
   b. FLIR Scout http://www.flir.com/hunting-outdoor/display/?id=44756
   c. FLIR BHS Handheld Thermal Camera (specially designed for consumer boaters and outdoor enthusiasts) http://www.flir.com/marine/display/?id=60445

4) Foreign availability. Products with near-to-eye displays are available from non-US sources and are controlled by the Wassenaar DUL. The proposed language will exclude US companies from selling abroad since non-US companies are selling dual-use items that would be captured by the

ITAR. Clearly, ITAR controlled products can't compete against similar performing dual-use products.

a. Jenoptik 1024 VarioCam http://www.jenoptik.com/en-variocam-hd-1024-research
b. NORIR – China. Cooled Dual-use binocular. http://www.norir.net/English/productsh.asp
c. Scout Guide (China) IR 517-35 640x480 UFPA monocular. http://www.flir-infrarotkameras.de/Scout-GUIDE-IR517-35640x480-4xZoom-Infraredcamera
d. Liemke M640 Wärmebildmonokular 640x480 monocular. http://www.lk-shop.com/neuheiten/106/liemke-m640-waermebildmonokular
e. Pyser-SGI Wärmebildmonokular PNP MTSD 640x480 monocular. http://www.lk-shop.com/neuheiten/109/pyser-sgi-waermebildmonokular-pnp-mtsd?c=80
f. Thermoteknix TiCam 750LR 640x480 UFPA biocular. http://www.scottcountry.co.uk/products_detail.asp?productID=5473

RECOMMENDATION: The language is broad and will capture dual-use products that are in normal commercial use and available from non-US sources. Additionally, the language is further confused by the Note to paragraph (c)(13) which is more restrictive than the language in this paragraph. It is recommended to specify military performance parameters or add the term "specially designed for military end-uses" to this section.

Note to paragraph (c)(13): The articles controlled in this paragraph include binoculars, bioculars, monoculars, goggles, or head- or helmet-mounted imaging systems or equipment (including video-based articles having a separate near-to-eye display) that incorporate or are specially designed to incorporate an IRFPA or IIT article (e.g., IDCA, IRFPA assembly) and electronics separately.

ISSUE: This note adds greater restriction than the language in (c)(13), therefore adding confusion about what is intended for control.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards.

(c)(15) Infrared search and track (IRST) systems or equipment that incorporate or are specially designed to incorporate an article controlled in this category, and maintain positional or angular state of a target through time, and specially designed parts and components therefor;

ISSUE: There are no military parameters listed. This broad description will capture commercial and dual-use systems. For example,

1) commercial automobiles have night vision systems with algorithms to track and identify pedestrians. http://www.bing.com/images/search?q=bmw+night+vision+with+pedestrian+detection&qpvt=bmw+night+vision+with+pedestrian+detection&qpvt=bmw+night+vision+with+pedestrian+detection&FORM=IGRE
2) Commercial and industrial security cameras use video analytics which track specified targets. https://www.youtube.com/watch?v=2yqPs8vbGSg&feature=youtu.be&list=PL446FFA4A396BCC2C

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

> ***(c)(16)(i) Infrared imaging systems or equipment (e.g., fully packaged cameras) incorporating or specially designed to incorporate an article controlled in this category, as follows, and specially designed electronics, optics, and displays therefor: (i) Having two or more axes of active stabilization and a minimum rootmean-square (RMS) stabilization better (less) than 200 microradians;***

ISSUE: There are no military parameters listed. Commercial and industrial products may be captured.

RECOMMENDATION: Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

> ***(c)(16)(iii) Infrared imaging systems or equipment (e.g., fully packaged cameras) incorporating or specially designed to incorporate an article controlled in this category, as follows, and specially designed electronics, optics, and displays therefor: (iii) Fixed-site reconnaissance, surveillance or perimeter security systems or equipment having greater than 640 detector elements in any dimension;***

ISSUE: This paragraph captures products in normal commercial use and products that are available from non-US manufacturers. A new term is introduced which is not defined, and a new metric for detector elements is used which doesn't match parameters used previously in this document. Items belonging in section (e) "components" are improperly included in this section which is focused on end-item equipment.

1) Products commercially available from non-US manufacturers which have greater than 640 detector elements in any dimension. The products shown below are controlled on the Wassenaar DUL and not on the Wassenaar Munitions List.
    a. Selex Horizon HD Camera 1280x720 cooled IRFPA (dual-use rated) http://www.selex-es.com/documents/737448/13781372/body_mm07756_Horizon_MWIR_LQ_.pdf
    b. Cassidian Nightowl M-ER 1280x1024 cooled IRFPA. http://www.defenceandsecurity-airbusds.com/en_US/web/guest/z_nightowl_m_er
2) The term "fully packaged camera" is introduced in this paragraph and the definition is not provided. There is a definition of camera in the EAR. Note 1 to 6A003.b states: ***Imaging cameras described in 6A003.b.4 include "focal plane arrays" combined with sufficient "signal processing" electronics, beyond the read out integrated circuit, to enable as a minimum the output of an analog or digital signal once power is supplied.*** The EAR definition of Imaging Camera has been in place and implemented as a term understood by industry and confirmed through the State Department Commodity Jurisdiction (CJ) process. The Wassenaar DUL has also adopted the EAR definition for Imaging Camera.
3) The term "640 detector elements in any dimension" is used in this section. Other paragraphs specify the total number of pixels, e.g., (c)(12)(iii) uses 328,000 detector elements, and (c)(12)(vi) uses "greater than 256 elements." It's not clear if the term "328,000 detector elements" has the same meaning as "640 detector elements in any dimension."
4) Language including "***and specially designed electronics, optics, and displays"*** should be in section (e) components. Confusion is unnecessarily created by randomly inserting a few components in this section.

RECOMMENDTION: Fixed site security and surveillance systems are primarily dual-use in nature and available from non-US manufacturers. Specify a military performance parameter or add the term "specially designed for military end-uses" to this section. Either remove "fully packaged camera" or provide a definition that matches the EAR and Wassenaar definitions for camera. Lastly, utilize definitions related to detector element resolution in a consistent manner.

(c)(16)(vi) Infrared imaging systems or equipment (e.g., fully packaged cameras) incorporating or specially designed to incorporate an article controlled in this category, as follows, and specially designed electronics, optics, and displays therefor: (vi) Hardened to withstand electromagnetic pulse (EMP) or chemical, biological, or radiological threats;

ISSUE: It is possible that due to technological advancements those items could become able to withstand harsh threats listed in this section without specific design intent.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards.

(c)(18) Near-to-eye display systems or equipment, specially designed for articles controlled in this subchapter;

ISSUE: This more appropriately addressed in paragraph (e)(12) where components are addressed.

RECOMMENDATION: Remove this language from section and address the item in (e)(12).

Note 1 to paragraph (c): A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) prevents direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA without destruction or damage to the IRFPA.

ISSUE: The concept of a permanent encapsulated sensor assembly is 1) not well defined and 2) is not a bright line parameter to distinguish an ITAR item from a CCL item.

IRFPAs are packaged using various methods depending on the type of detector. Microbolometer IRFPAs/detectors are typically packaged in a sealed vacuum device. Photon detector IRFPAs may be packaged in different methods depending on many factors. A photon detector may eventually become packaged in a sealed vacuum assembly however; those steps have little to do with whether the device is military in nature. It's not clear why the "permanent encapsulated sensor assembly" is used as a military parameter. One can speculate that the USG is concerned about either reverse engineering of IRFPAs, diversion of IRFPAs, or both.

Permanent encapsulation will not eliminate reverse engineering by an entity that is knowledgeable, funded and motivated. However, reverse engineering is a concern for all technologies and companies such as FLIR institute extensive measures to protect intellectual property.

The motivation to purchase a camera assembly with the purpose to remove the IRFPA for diversion into a military system isn't practical. The availability of IRFPAs world-wide and the extra cost of purchasing a camera to harvest the IRFPA then dispose of the camera assembly isn't cost effective or practical on any type of a large scale basis. It is possible that there might be a one-off situation where an IRFPA is removed from a commercial camera, but it is unlikely to occur in volume.

In summary, FLIR is concerned that the encapsulation of an IRFPA is being used as a distinguishing parameter for a military item, which has no bearing on its military utility. Further, we are concerned that the definition of a permanent encapsulation sensor assembly is not sufficiently defined.

RECOMMENDATION: Remove this packaging concept as criteria for distinguishing a military item and add language that CAT XII will control FPAs specially designed for military applications.

> ***Note 2 to paragraph (c): The articles described in paragraphs (c)(1) through (5), (c)(7), (c)(8), and (c)(12) other than (c)(12)(ix) having greater than 640 detector elements in any dimension, and (c)(12)(x) are subject to the EAR when, prior to export, reexport, retransfer, or temporary import, they are integrated into and included as an integral part of an item subject to the EAR, and cannot be removed without destruction or damage to the article or render the item inoperable. Articles are not subject to the EAR until integrated into the item subject to the EAR. Defense articles intended to be integrated, and technical data and defense services directly related thereto remain subject to the ITAR prior to integration. See paragraph (f) of this category for enumerated technical data and software, and specific information subject to the EAR.***

ISSUE: This note represents multiple problems; A) a tamper protection concept is introduced with very little detail, B) Commercial practicalities of selling, operational training, manufacturing, logistics, and servicing, are not considered. Also, as explained throughout this document the CAT XII proposed language is attempting to place ITAR controls on dual-use items that are commercially available from non-US sources. This section would not be required if the CAT XII placed controls at the system level rather than the dual-use component level.

1) Tamper protection is a term that has been used as a concept by the USG related to dual-use products however, there has never been a clear definition. Based on discussions with the USG, the purpose of the proposed language is to make it impossible to remove a component from a commercial product so that it can't be diverted for military purposes.
    1. Most of the components of concern are available from non-US sources. It would not make sense to purchase an entire system to only harvest a component which is available commercially from sources outside of the US. It will be much more cost effective for an entity to purchase the components from a non-US manufacturer.
    2. Tamper protection introduces complications for sales to commercial customers. Customers are concerned that tamper measures may impact the reliability of the product. Additionally, it adds a level of complication to a product and potential "invasive" perception of a US product.
2) There are multiple commercial impracticalities associated with this proposed language for a non-US manufacturer integrating a US ITAR controlled item.
    1. State Department authorization will be required to provide the component to a non-US manufacturer of a dual-use item. This will most likely include a temporary export license (DSP-73), a hardware license (DSP-5), a temporary import license (DSP-61) and possibly a technical assistance agreement (TAA) to help the customer with integration.
        i. The ITAR does not allow a product to change jurisdiction outside of the US, so once the ITAR component is integrated into the dual-use product, the final

assembly must be returned to the US to gain dual-use jurisdiction. Upon this return to the US, an EAR authorization may be used for export of the product from the US to the intended destination. Clearly, this is a costly process that requires significant coordination and extensive knowledge of both the ITAR and the EAR. Due to these complications, this is not a path that most non-US manufacturers will be willing to take.

ii. Assuming the plan described in i. above, it will also be required that the non-US manufacturer incorporating this ITAR component be compliant with the ITAR. This involves control of access of ITAR data and hardware, communication of citizenship of non-US employees and many other ITAR requirements. Again, it is unlikely that a non-US manufacturer of a dual-use item will choose to take this ITAR intensive path.

2. It is cost-prohibitive to design a product where the critical components in the system will be permanently damaged when removed. Commercial markets are driving the growth of the thermal imaging requirements world-wide as shown in Figure 6. Commercial growth is contingent on lower costs and it isn't practical to have key components destroyed during routine maintenance, servicing or repair.
3. Many US manufacturers have service centers world-wide in order to perform maintenance, service and repair of its products. The proposed language will complicate the ability of US companies to service its products and thus negatively impact its ability to compete globally.
4. Many existing products would need to be redesigned in order to implement this proposed language. This would be an extreme hardship on US manufacturers who have already invested significant funds in product development. The result will be a loss of market share while redesigning products, and it will be a boon to non-US manufacturers who would not be under the same constraint to have components become inoperable when removed.

RECOMMENDATION: Remove this note in its entirety. It is so completely impractical in a commercial market place and would only result in greatly impeding US company's ability to compete in the global market.

(e) Parts, components, accessories, attachments, and associated equipment as follows:

ISSUE: This section is controlling items that are commercially available from non-US sources.

RECOMMENDATION**:** Specify a military performance parameter or add the term "specially designed for military end-uses" to this section.

(e)(3) Wafers incorporating structures for either a ROIC controlled in paragraph (e)(4) or (5) of this category, or an IRFPA or detector elements therefor controlled in paragraph (c)(2) of this category;

(e)(4) Read-Out Integrated Circuits (ROICs) specially designed for an IRFPA controlled in paragraph (c)(2) of this category or detector elements therefor, as follows:

Note to paragraph (e)(4): ROICs are specially designed for an infrared focal plane array detector even if the detector is incorporated into an item that is not enumerated on the U.S. Munitions List.

(e)(5) ROICs specially designed for a camera/core/packaged IRFPA subject to the controls of this subchapter;

ISSUE: (e)(3), (e)(4), Note to (e)(4) and (e)(5) will be addressed together. The details for the design and manufacturing of ROICs for IRFPAs are widely available in the public domain. There are hundreds of patents issued and annual papers published and presented at international technical symposiums. ROIC design techniques are taught in universities and at conferences. Entities located outside of the US and Wassenaar, such as China, Taiwan, and Israel design and manufacture ROICs for infrared focal plane arrays. The ROIC devices are manufactured at silicon foundries world-wide. Existence of this technical capability outside of the US and Wassenaar is evident by the significant number of patents and published papers available on this technology.

1) Patents. A search of the United States Patent Technology Office database produced over five hundred (500) patents issued worldwide directly related to ROICs for IRFPAs and are listed in Exhibit A. Additionally, of the five hundred patents there are over fifty (50) patents issued to entities in China, listed in Exhibit B. The patent searches performed for these reports were not exhaustive and it is highly likely that many more patents related to this technology would be found after a more thorough search.
2) Published Papers. Papers have been published for decades on the details of the design and testing of ROICs. Following are a few examples of papers that have been published by entities outside of Wassenaar on this topic.
    a. The Institution of Electronics and Telecommunications Engineers (IETE) Journal of Research has published many relevant papers including: "320x256 Readout Integrated Circuit for Infrared Focal Plane Arrays with Low-Temperature MOSFET Model." Authored by a team from the National ASIC System Engineering Research Center, Southeast University, Nanjing, Jiangsu, China.
    b. SPIE – "Optimization of Readout Circuit with Background Suppression for Dual-Band Quantum Well Infrared Focal Plane Array Photodetector." Authored by a team from the National Chi Nan University in Taiwan.
    c. SPIE Photonics Asia – "Design low-noise readout circuit for near-infrared InGaAs focal plane array", Paper 8562-4 Author(s): Zhangcheng Huang, Huang Songlei, Jiaxiong Fang, Shanghai Institute of Technical Physics (China)
3) Conferences / Symposiums. The International Society of Optical Engineering (SPIE) hosts symposiums where papers on details related to ROICs, focal plane arrays, lasers, and many other electro-optical devices are presented. Additionally, SPIE offers classes related to ROIC design at conferences, such as the Defense, Security and Sensing (DSS) Symposium, in Baltimore. The following examples represent just a small sampling of the over one hundred courses offered either on-line or during a given DSS Symposium as well as courses that have been offered for over twenty years.
    a. Analog-to-Digital Converters for Digital ROICs (SC1076). This course surveys structure and operation of analog-to-digital converters (ADCs) implemented on digital readout integrated circuits (ROICs) and digital image sensors.
    b. The SPIE database contains charts and notes from ROIC and FPA design courses taught annually going back to 1994.

   c. The presentations and courses presented at SPIE are typically approved by the US DOD, and are attended by international and domestic audiences.

4) University Degrees. Many US and non-US universities have practical courses in IC design. Some of the best universities in this area of study are MIT, Stanford, UC Berkeley, Cal Tech, and the University of Utah. It is common for non-US citizens, including Chinese nationals, who have been educated and received advanced degrees from one of the universities listed above, to apply for and in some cases be hired for IC design positions to US companies that design ROICs.
5) Consequences. In addition to the basic issue that the technology is widely available, the proposed control will only serve to hamstring US manufacturers of ROICs and IRFPAs. There are consumer level products such as CCD video cameras, automotive sensors, and gaming sensors (X-Box) that will be burdened with new export controls. Currently, the automotive and gaming industries use NIR monolithic FPAs with non-eye-safe lasers. Measuring ranges is required for these industries and the need for longer ranges and increased pixel counts is growing. Because of FDA safety requirements this need is driving laser wavelengths into the eye-safe SWIR band and consequently these industries will be profoundly impacted by this proposed control on ROICs. The proposed language casts an overly broad net that will capture not only existing consumer products but also those that are under development or not yet envisioned.
6) Non-US sources provide ROICs on a commercial basis.
   a. Mikro Tasarim, in Turkey is a merchant supplier of ROICs for IRFPAs offer a variety of ROICs including a 1280x1024 for SWIR IRFPAs. http://www.mikro-tasarim.com.tr/products
   b. Xenics, in Belgium offers a wide variety of IRFPA devices and ROIC design services. http://www.xenics.com/en/application/custom-infrared-roic-design
   c. New Imaging Techologies (NIT), in France offers standard components and ROIC design services. http://www.new-imaging-technologies.com/ingaas-products.html
   d. Tumsis, in Turkey designs ROICs for IRFPAs. http://www.tumsis.com/capabilities.html
   e. Imec, in Belgium offers components and design services. http://www2.imec.be/be_en/research/image-sensors-and-vision-systems/hyperspectral-imaging.html
7) Major non-US IRFPA manufacturers have in-house ROIC design capability. Companies such as Semi-Conductor Devices (SCD) in Israel, Sagem and Sofradir in France, Selex in the UK all have in-house ROIC design capability.
8) As shown in Figure 2 there are many Chinese IRFPA manufacturers and they claim to design their own ROICs for the IRFPAs they manufacture. The ROICs are manufactured at silicon foundries in China.
9) As noted by BIS in the CAT XII Website Guidance dated 15 June 2015, many ROICs for IRFPAs not designed for military applications have been controlled as EAR 99 dual-use items.

RECOMMENDATION: ROIC design capability and commercially available devices are available world-wide, and ROICs are manufactured world-wide. Placing broad controls on these devices will have a negative impact on US companies who design these devices, to commercial silicon foundries which manufacture ROICs, and also to customers for ROICs. Non-US ROIC designers will flourish and their intellectual property portfolios will continue to expand. It is not possible to identify specific parameters that are unique to a military end-use for ROICs. As a result the only solution is to incorporate the term "specially designed for military end-uses" to this section.

(e(6) Vacuum packages or other sealed enclosures for an IRFPA or IIT controlled in paragraph (c) of this category specially designed for

incorporation or integration into an article controlled in paragraphs (a), (b), or (c) of this category;

ISSUE: As detailed in section (c) there are a large number of non-US companies which design, manufacture and sell IRFPAs and products incorporating IRFPAs. IRFPAs typically are installed in vacuum packages and other sealed enclosures. IRFPA manufacturers typically have this packaging capability in-house. Given the wide spread availability of IRFPAs and packaging capability it is not logical to place ITAR controls on US companies for this technology.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards. During the CAT XV review it was agreed that designing and building to military standards must be intentional and it was acknowledged that these requirements are significant cost drivers.

(e)(7) Integrated IRFPA dewar cooler assembly (IDCA) parts and components, as follows:
(i) Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours;

ISSUE: Cryocooler technology is not unique to the US. The technology is available world-wide and there are technical groups, such as the Cryogenic Society of America http://www.cryogenicsociety.org/ which welcome an international roster of members. The CSA website has significant technical data and resources related to cryocoolers. The parameters listed in this section are outdated and don't represent military specifications. Typical commercially available cryocoolers have a MTTF of 10,000 to 30,000 hours.

Non-US availability
1) Ricor in Israel has a vast array of cryocoolers commercially available. http://www.ricor.com/products/comparison-table/
2) Aim in Germany has a vast array of cryocoolers commercially available. http://www.aim-ir.com/en/main/products/cryocoolers.html
3) Thales in France has a vast array of cryocoolers commercially available. http://www.thales-cryogenics.com/

RECOMMENDATION: Cryocoolers are not unique to the US and the standard performance is well beyond the requirement listed in this section. This CAT XII document must specify a military performance parameter or add the term "specially designed for military end-uses" to this section. Additionally, the approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards. During the CAT XV review it was agreed that designing and building to military standards must be intentional and it was acknowledged that these requirements are significant cost drivers.

(e)(7) (ii) Active cold fingers;

ISSUE: All IDCAs have active cold fingers.

RECOMMENDATION: Remove from the ITAR unless specially designed for military end-uses.

(e)(7)(iv) Dewars specially designed for articles controlled in paragraphs (a), (b) or (c) of this category;

ISSUE: There are no military parameters or use restrictions listed. As demonstrated in this document, not all of the articles currently listed in the draft proposal are military items. Additionally, there should be a definition that distinguishes the items covered in this section and the vacuum packages covered in (e)(6).

RECOMMENDATION: Remove from the ITAR unless specially designed for military end-uses. Additionally, the approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards. During the CAT XV review it was agreed that designing and building to military standards must be intentional and it was acknowledged that these requirements are significant cost drivers.

(e)(9) Infrared lenses, mirrors, beam splitters or combiners, filters, and treatments and coatings, specially designed for any article controlled in this category;

ISSUE: There are no military parameters or use restrictions listed. As detailed in section (c) there are a large number of non-US companies which design, manufacture and sell products which are proposed for control in CAT XII. Given the world-wide availability of products covered in CAT XII it is not logical to place ITAR controls on US companies for this technology.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards.

(e)(10) Drive, control, signal or image processing electronics, specially designed for articles controlled in this category;

ISSUE: There are no military parameters or use restrictions listed. As detailed in section (c) there are a large number of non-US companies which design, manufacture and sell products which are proposed for control in CAT XII. Given the world-wide availability of products covered in CAT XII it is not logical to place ITAR controls on US companies for this technology.

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards. During the CAT XV review it was agreed that designing and building to military standards must be intentional and it was acknowledged that these requirements are significant cost drivers.

(e)(12) Near-to-eye displays specially designed for articles controlled in this category;

ISSUE: There are no military parameters or use restrictions listed. As detailed in section (c) there are a large number of non-US companies which design, manufacture and sell products which are proposed for control in CAT XII. Given the world-wide availability of products covered in CAT XII it is not logical to place ITAR controls on US companies for this technology.

Commercially Available. The companies below manufacture near to eye displays that are used in consumer level products, such as Google Glasses, and also for military thermal weapon sights.

1) Kopin Corporation. http://www.kopin.com/capabilities/display
2) eMagin. http://www.emagin.com/oled-microdisplays/

Non-US Sources

1) ECVV, China. http://www.ecvv.com/product/3230547.html
2) Holoeyes Photonics, Germany. http://holoeye.com/lcos-microdisplays/
3) The Micro Display page. This is a European maintained reference to research and manufacturers of micro displays http://tfcg.elis.ugent.be/microdis/

RECOMMENDATION: The approach taken in Category XV is a logical approach. Products must be designed, rated, tested or advertised to be considered military. The military does not purchase products without validation and certification of environmental design and implementation standards.

Note to paragraph (e): The articles described in this paragraph are subject to the EAR when, prior to export, reexport, retransfer, or temporary import, they are integrated into and included as an integral part of an item subject to the EAR, and cannot be removed without destruction or damage to the article or render the item inoperable. Articles are not subject to the EAR until integrated into the item subject to the EAR. Defense articles intended to be integrated, and technical data and defense services directly related thereto, remain subject to the ITAR prior to integration. See paragraph (f) of this category for enumerated technical data and software, and specific information subject to the EAR.

ISSUE: There are multiple commercial impracticalities associated with this proposed language for a non-US manufacturer integrating a US ITAR controlled item.

1. State Department authorization will be required to provide the component to a non-US manufacturer of a dual-use item. This will most likely include a temporary export license (DSP-73), a hardware license (DSP-5), a temporary import license (DSP-61) and possibly a technical assistance agreement (TAA) to help the customer with integration.
   i. The ITAR does not allow a product to change jurisdiction outside of the US, so once the ITAR component is integrated into the dual-use product, the final assembly must be returned to the US to gain dual-use jurisdiction. Upon return to the US, an EAR authorization may be used for export of the product from the US to the intended destination. Clearly, this is a costly process that requires significant coordination and extensive knowledge of both the ITAR and the EAR. This is not a path that a non-US manufacturer is likely to take.
   ii. Assuming the plan described in i. above, it will also be required that the non-US manufacturer incorporating this ITAR component be compliant with the ITAR. This involves control of access of ITAR data and hardware, communication of

citizenship of non-US employees and many other ITAR requirements. It is unlikely that a non-US manufacturer of a dual-use item will choose to take this ITAR intensive path.

2. It is cost-prohibitive to design a product where the critical components in the system will be permanently damaged when removed. Commercial markets are driving the growth of the thermal imaging requirements world-wide as shown in Figure 6. Commercial growth is contingent on lower costs and it isn't practical to have key components destroyed during routine maintenance, servicing or repair.
3. Many US manufacturers have service centers world-wide in order to perform maintenance, service and repair of its products. The proposed language will complicate the ability of US companies to service its products and thus negatively impact its ability to compete globally.
4. Many existing products would need to be re-designed in order to implement this proposed language. This would be an extreme hardship on US manufacturers who have already invested significant funds in product development. The result will be a loss of market share while re-designing products, and it will be a boon to non-US manufacturers who would not be under the same constraint to have components become inoperable when removed.

RECOMMENDATION: Remove this note in its entirety. It is so completely impractical in a commercial market place and would only result in greatly impeding US company's ability to compete in the global market.

(f) Technical data (as defined in §120.10 of this subchapter) and defense services (as defined in §120.9 of this subchapter) directly related to the defense articles enumerated in paragraphs (a) through (e) of this category. (See §125.4 of this subchapter for exemptions.) (MT for technical data and defense services related to articles designated as such.)

ISSUE: It is difficult to comment on this section since the articles proposed for control in CAT XII are primarily dual-use items as detailed in this paper. Additionally, this section needs further review considering that DDTC and BIS have just released for public comment proposed definitions related to technical data.

RECOMMENDATION: This section (f) requires revision once CAT XII is drafted to properly address only military items, and also requires close coordination with the BIS and DDTC proposed definitions for technical data and software.

CONCLUSION

FLIR is greatly concerned that the proposal for Category XII does not reflect the expressed purpose of ECR. The proposed draft for CAT XII fails for several reasons as listed below.

- Commercial markets dominate sales of many technologies described in the Category XII draft
- Foreign availability is not adequately considered
- Actual military items are not specified in the proposal

It is incredibly disappointing that the result of multiple years of review of Category XII by the USG Interagency group resulted in a proposal that has serious negative consequences to US industry.

- US companies will be restricted from competing globally
- Non-US sales for commercial and dual-use applications for thermal imaging represent half of the world-wide demand for this technology[4]. US companies will not be able to access these critical revenue sources.
- Advanced technology development will be impeded by reduced financial resources that would be available from non-US sales. Non-US sales have been essential to fund R&D especially since US DOD funding for IRFPA technology development has been greatly reduced over the past decade.
- US companies will not be incentivized to continue to invest in US based technology or factories
- Non-US companies will be motivated to continue to invest in developing this technology and will ultimately dominate the market

Placing ITAR controls on dual-use technology will have the unintended effect of strengthening non-US companies at the expense of US manufacturers. Overseas customers will avoid ITAR controls by turning to those offshore producers; US producers will lose economies of scale, and in the end America's military will become dependent on non-US sources for this vital technology.

Therefore, FLIR recommends that this proposal be fundamentally rewritten after thorough and sincere collaboration with stakeholders among industry, USG, and research institutes. FLIR has been an active participant in this CAT XII discussion by participation and assuming leadership roles in Industry / Government organizations such as the Department of Commerce's Sensors and Instrumentation Technical Advisory Committee (SITAC), and the State Department's Defense Trade Advisory Group (DTAG). FLIR is committed to continue to partner with the USG and work towards the creation of a meaningful and logical path forward to assure protection of US national security as well as create an environment that will allow US companies to thrive, innovate, create jobs, compete globally, and support maintaining US leadership in a critical technology.

287	US7332720	US	US Grants	Cold shield for cryogenic camera	US10/683073	Northrop Grumman Systems Corporation
288	CN101103308	CN	CN Patents	Method and apparatus for controlling a lens, and camera module incorporating same	CN200580033219	Panavision Imaging Llc
289	EP0721224	EP	EP Applications	Focal plane array for hybrid thermal imaging system and method	EP953095	Raytheon Company
290	EP0678756	EP	EP Applications	Staring focal plane array architecture for multiple applications.	EP951058	Raytheon Ti Systems, Inc.
291	US7235773	US	US Grants	Method and apparatus for image signal compensation of dark current, focal plane temperature, and electron	US11/104206	Exelis, Inc.
292	JP3998599	JP	JP Grants	Thermal infrared solid-state imaging apparatus	JP2003124794	Mitsubishi Electric Corp
293	EP0680101	EP	EP Grants	Thermal detector and method of making the same	EP953029	Raytheon Company
294	US20100038520	US	US Applications	Method and apparatus for detecting presence and range of a target object using a multimode detector	US12/581640	Lockheed Martin Corporation
295	CN201229510	CN	CN Patents	High precision temperature control device for infrared focus plane	CN200820068474	Hubei Grinds Plentiful Photoelectricity Science And Technology Co., Ltd.
296	US5485010	US	US Grants	Thermal isolation structure for hybrid thermal imaging system	US08/182868	L-3 Communications Corporation
297	CN101894848	CN	CN Patents	Tellurium-cadmium-mercury infrared focal plane integrated with anti-reflection film and method for preparin	CN201010198869	Shanghai Institute Of Technical Physics, Chinese Academy Of Sciences
298	US5426304	US	US Grants	Infrared detector thermal isolation structure and method	US08/182865	Raytheon Company, A Corporation Of Delaware
299	US5436450	US	US Grants	Infrared detector local biasing structure and method	US08/182268	Raytheon Company, A Corporation Of Delaware
300	US20080208514	US	US Applications	Threat launch detection system and method	US11/588247	Bae Systems Information And Electronic Systems Integration Inc.
301	CN100444381	CN	CN Patents	Backward integrated micro-lens infrared focal plane detector and micro-lens producing method	CN200610117106	Shanghai Inst. Of Technical Physics
302	US7224009	US	US Grants	Method for forming a low leakage contact in a cmos imager	US11/128176	Micron Technology, Inc.
303	CN100433328	CN	CN Patents	Infrared focal plane detector with antireflective convergence microlens and microlens preparing method	CN200610118053	Shanghai Inst. Of Technical Physics, Cas
304	CN101201271	CN	CN Patents	Internal modulation type ferro-electricity non-refrigeration infrared focal plane prober	CN200710066481	Yunnan Nationalities University
305	CN1949508	CN	CN Patents	Infrared focal plane detector with antireflective convergence microlens and microlens preparing method	CN200610118053	Shanghai Inst. Of Technical Physics, Cas
306	CN101871817	CN	CN Patents	Hybrid-type pyroelectric uncooled focal plane detector and manufacturing process thereof	CN200910094401	Kunming Institute Of Physics
307	US7385199	US	US Grants	Microbolometer ir focal plane array (fpa) with in-situ mirco vacuum sensor and method of fabrication	US11/162849	Teledyne Scientific & Imaging, Llc
308	US5179283	US	US Grants	Infrared detector focal plane	US07/390058	Raytheon Company A Corporation Of Delaware
309	CN102509728	CN	CN Patents	Design and preparation method of non-refrigeration infrared detector	CN201110338955	Peking University
310	US20070075888	US	US Applications	Digital readout method and apparatus	US11/415007	Massachusetts Institute Of Technology, The
311	US20120193608	US	US Applications	Frontside-illuminated inverted quantum well infrared photodetector devices and methods of fabricating the	US13/019658	L-3 Communications Cincinnati Electronics Corporation
312	US5572059	US	US Grants	Thermal isolation of hybrid thermal detectors through an anisotropic etch	US08/477718	L-3 Communications Corporation
313	US5602392	US	US Grants	Thermal crosstalk reduction for infrared detectors with common electrodes	US08/476409	L-3 Communications Corporation
314	US5304791	US	US Grants	Apparatus for detecting high speed events	US07/919136	Ail Systems, Inc.
315	CN101201271	CN	CN Patents	Internal modulation type ferro-electricity non-refrigeration infrared focal plane prober	CN200710066481	Yunnan Nationalities University
316	US20090268069	US	US Applications	Photopumped semiconductor image amplifier with optical preamplification	US12/148970	Northrop Grumman Systems Corporation
317	CN1214480	CN	CN Patents	Apparatus which includes virtually imaged phased array (vipa) in combination with wavelength splitter to der	CN98119460	Fujitsu, Ltd.
318	EP0999599	EP	EP Applications	Optical cavity enhancement infrared photodetector	EP99250287	Lockheed Martin Corporation
319	CN101894848	CN	CN Patents	Tellurium-cadmium-mercury infrared focal plane integrated with anti-reflection film and method for preparin	CN201010198869	Shanghai Institute Of Technical Physics, Chinese Academy Of Sciences
320	JP11223745	JP	JP Applications	Device equipped with virtual image phase array combined with wavelength demultiplexer for demultiplexing	JP285015	Fujitsu Ltd
321	US5309223	US	US Grants	Laser-based semiconductor lead measurement system	US07/719727	Cyberoptics Corporation
322	US5457318	US	US Grants	Thermal detector apparatus and method using reduced thermal capacity	US08/235413	L-3 Communications Corporation

323	US7245133	US	US Grants	Integration of photon emission microscope and focused ion beam	US10/985808	Dcg Systems, Inc.
324	WO2007085942	WO	WO Applications	Photodiode readout circuit	IB2007000165	Melexis Nv
325	US20070012870	US	US Applications	Analog bus driver and multiplexer	US11/454342	California Institute Of Technology
326	WO2006138564	WO	WO Applications	Analog bus driver and multiplexer	US20060234	California Institute Of Technology
327	US7579594	US	US Grants	Infrared radiation imager having sub-pixelization and detector interdigitation	US12/033648	Drs Sensors & Targeting Systems, Inc.
328	US20120001073	US	US Applications	Ir detector system and method	US13/203220	Selex Galileo Limited
329	CN1696658	CN	CN Patents	Multichannel detector module on focal plane of infrared ray and installation method	CN200510025915	Shanghai Inst Of Tech Physics, C.a.s
330	US7145124	US	US Grants	Multispectral imaging chip using photonic crystals	US10/941204	Raytheon Company
331	EP0644443	EP	EP Applications	Three-dimensional opto-electric integrated circuit using optical wiring.	EP941143	Hitachi, Ltd.
332	CN101872804	CN	CN Patents	Plasma backflow forming method for photoresist micro-convex lens array for mask	CN201010182280	Shanghai Institute Of Technical Physics, Chinese Academy Of Sciences
333	CN201927607	CN	CN Patents	Photovoltaic mercury-cadmium-tellurium infrared focal plane integrated with antireflection coating	CN201020224891	Shanghai Institute Of Technical Physics Chinese Academy Of
334	US7339216	US	US Grants	Vertical color filter sensor group array with full-resolution top layer and lower-resolution lower layer	US11/285470	Foveon, Inc.
335	US4618763	US	US Grants	Infrared focal plane module with stacked ic module body	US06/722776	Grumman Aerospace Corporation
336	US5332899	US	US Grants	System for converting an infrared image into a visible or near infrared image	US08/063333	Commissariat A L'energie Atomique
337	US20050012033	US	US Applications	Digital photon-counting geiger-mode avalanche photodiode solid-state monolithic intensity imaging focal-pla	US10/836896	Massachusetts Institute Of Technology
338	US20120230602	US	US Applications	Multi-bank tdi approach for high-sensitivity scanners	US12/230100	Lockheed Martin Missiles And Fire Control
339	US20060054780	US	US Applications	Multispectral imaging chip using photonic crystals	US10/941204	Raytheon Company
340	US20030230722	US	US Applications	Ambient-to-cold focus and alignment of cryogenic space sensors using uncooled auxillary detectors	US10/171956	Raytheon Company
341	US20100046853	US	US Applications	Multi-bank tdi approach for high-sensitivity scanners	US12/230100	Lockheed Martin Missiles And Fire Control
342	US6021172	US	US Grants	Active pixel sensor having intra-pixel charge transfer with analog-to-digital converter	US08/567469	California Institute Of Technology
343	US8153978	US	US Grants	Dual color/dual function focal plane	US11/715617	Oceanit Laboratories, Inc.
344	US7791026	US	US Grants	Microbolometer infrared security sensor	US11/817165	
345	CN101871817	CN	CN Patents	Hybrid-type pyroelectric uncooled focal plane detector and manufacturing process thereof	CN200910094401	Kunming Institute Of Physics
346	CN1900740	CN	CN Patents	High spectrum full polarization imaging remote sensing system	CN200510086926	Beijing Univ. Of Aeronautics And Astronatucis
347	US6833547	US	US Grants	Ambient-to-cold focus and alignment of cryogenic space sensors using uncooled auxillary detectors	US10/171956	Raytheon Company
348	CN1067176	CN	CN Patents	Device for detecting deviation of pin of integrated circuit, and its data processing method	CN95102426	Daheng New Epoch Technology, Inc.
349	US5084704	US	US Grants	Focal plane analog-to-digital converter	US07/473742	Grumman Aerospace Corporation
350	US8076629	US	US Grants	Photopumped semiconductor image amplifier comprising a waveguide with embedded quantum wells and a	US12/148970	Northrop Grumman Systems Corporation
351	CN101833347	CN	CN Patents	Temperature drift reducing device and control method thereof	CN201010161729	University Of Electronic Science And Technology Of China
352	US20080135757	US	US Applications	Infrared radiation imager having sub-pixelization and detector interdigitation	US12/033648	Drs Sensors & Targeting Systems, Inc.
353	KR20070083593	KR	KR Patents	Method and apparatus for controlling a lens, and camera module incorporating same	KR20077006885	Panavision Imaging, Llc
354	US6157042	US	US Grants	Optical cavity enhancement infrared photodetector	US09/185249	Xylon Llc
355	JP3112105	JP	JP Grants	Semiconductor optical element	JP26640091	Nippon Telegr & Teleph Corp Lt;nttgt;
356	JP7087406	JP	JP Applications	Signal read circuit and its drive system	JP22994693	Nec Corp

Subjects: RIN 0694-AF75 - Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, Optical, and Guidance and Control Equipment the President Determines No Longer Warrant Control Under the United States Munitions List (USML)

and RIN 1400-AD32 Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

Dear Sir or Madam:

Fluke Corporation is pleased to have the opportunity to provide feedback on the Administration's proposed rule, Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII ("Proposed Rule") and complementary revisions to the Export Administration Regulations ("EAR Revisions"). This comment focuses on proposed changes to controls related to commercial thermal imaging cameras and addresses certain apparent shortcomings with respect to several of the stated goals of the Administration's rulemaking.

Fluke is concerned that the Proposed Rule identifies items for control on the United States Munitions List ("USML") that are not controlled on the Wassenaar Arrangement's Munitions List ("WAML"), does not establish a bright line between the USML and Commerce Control List ("CCL"), and controls items on the International Traffic in Arms ("ITAR") that are in normal commercial use and have foreign availability. Additionally, the EAR Revisions creates new controls on items that were not previously controlled, increases licensing requirements, removes availability of license exceptions and even imposes a presumption of denial for certain items, all of which appear to be contrary to Export Control Reform ("ECR").

The rewrite of USML Category XII and complementary EAR Revisions was initiated to protect the commodities and components most important to our military, while providing relief to companies struggling with outdated and overly burdensome regulations by placing less sensitive items on the more flexible CCL. This Proposed Rule falls significantly short of both of these goals.

Rather than providing a bright jurisdictional line between the CCL and the USML, the proposed revisions will lead to increased confusion, and enforce expansive restrictions that place heavier burdens on U.S. originated products. Many of these restrictions will place greater constraints on items that have non-military commercial applications and are readily available in foreign markets.

Under the current export control model, the U.S. thermal imaging industry is already at a competitive disadvantage against our foreign competitors. To be more competitive with foreign competitors, U.S. companies must find ways to reduce the impact of export control licensing hurdles. Therefore, many U.S. multi-national companies have chosen to move research, development and manufacturing to off-shore subsidiaries outside the U.S., and in some cases U.S. companies are fully outsourcing these functions to non-U.S. companies.

While the stated goal of maintaining strict export controls around thermal imaging technology is to preserve U.S. technological and tactical advantages, we are concerned that these changes will ultimately backfire, and lead to U.S. dependence on foreign technology. The impact of these decisions will be felt by the U.S. commercial base and the U.S. Government. Advanced thermal imaging technology and products will soon be dominated by foreign industries. U.S. consumers – including the U.S. Government - will have to pay more for products produced outside the U.S. and the U.S. Government may lose access to domestic sources of the newest technologies, may become reliant on foreign sources for a critical tactical capability, and our war-fighters ultimately may be put at a disadvantage. Additionally, the proposed licensing requirements for EAR items will dramatically limit U.S. companies ability to compete with European competitors.

Fluke Corporation supports the U.S. Government's desire to protect U.S. technology and national security. Export controls play an important part in this endeavor. However, if the regulations are not carefully drafted to limit the strictest controls to products and technology that are critical to our national security, are equally protected by our allies, are not already in commercial use, and are not readily available in foreign markets, export controls begin to have the opposite effect.

The Sensors and Instrumentation Technical Advisory Committee ("SITAC"), amongst other advisory and industry groups, have been working with the Departments of State, Defense and Commerce for several years to develop U.S. export controls for thermal imaging products and technology that meet U.S. national security needs , are aligned with the Wassenaar Arrangement controls, and are practical for the U.S. industry. The SITAC is comprised of representatives from the world's best thermal imaging companies, currently based in the United States. These representatives, mostly highly skilled engineers, have proposed regulations that meet the goals of U.S. export control reform, but very few, if any of these recommendations are reflected in the proposed rules. Fluke Corporation supports technical recommendations by the SITAC and other technical advisory committees and respectfully asks that DDTC and BIS accord the recommendations of these committees greater weight when developing alternatives to the current proposed changes to Category XII and complementary provisions of the EAR.

A. HARDWARE - INFRARED FOCAL PLAY ARRAYS, CORES AND CAMERAS

I. The Proposed Rule Identifies Items for USML Control that are not controlled on the Wassenaar Arrangement's Munitions List

Category XV of the WAML controls, inter alia, Infrared or thermal imaging equipment, specially designed for military use, and specially designed components and accessories therefor. A number of the items described in the Proposed Rule are in normal commercial use throughout the world and are not currently controlled on the USML nor are they described on the WAML. Specific examples of these items are described below in section III.

II. The Proposed Rule Does Not Establish a Bright Line Between the USML and CCL

a. Integration of an IRFPA into a permanent encapsulated sensor assembly as a control parameter in Category XII (c) is not technically sound and will increase the need for CJs

Instead of providing a "bright line" for Infrared Focal Play Arrays ("IRFPAs"), the attempt in subparagraph (c)(2)-(6) to draw a jurisdictional line for IRFPAs by distinguishing those in a "permanent encapsulated sensor assembly" from those that are not creates a vast gray zone and an increased need for Commodity Jurisdiction Requests ("CJs"). This approach is flawed on several levels:

1. It has nothing to do with utility of IRFPAs for military versus civil applications. Packaging/encapsulating an IRFPA does nothing to make it more useful or appropriate for civil applications or any less useful or appropriate for military applications. Indeed, IRFPAs have well-established utility in both civil and military applications; they are inherently dual use and do not warrant control on the USML Attempting to draw a line between the "raw" IRFPA and a packaged IRFPA does nothing to change the fact that IRFPA's are inherently dual use items.

2. There's no clear reason why the controls or jurisdictions should be different for the packaging versus the IRFPA die. The IRFPA package/encapsulation and the technology to make it is generally equally important in achieving the overall function and performance of an IRFPA as the technology to make the FPA die that goes into the package. In the case of uncooled microbolometers, without the vacuum package there is no meaningful IR responsivity whatsoever. Said another way, without the vacuum package, the FPA die is really not an IRFPA at all. In the case of cooled, photon-detection IRFPAs, without the package the device could not be cooled to the necessary operating temperature without moisture or frost that would render it inoperable. (As a side note, it could be argued that, for at least these reasons, the pre-packaged/encapsulated arrays would be more properly classified and treated as components, not finished IRFPAs.)

3. The gray zone created by the proposed regulations would be especially difficult for wafer-level or pixel-level packaged microbolometer IRFPAs. With wafer-level and pixel-level integral vacuum packaging technologies, the FPA die itself forms a portion of the vacuum package. With wafer-level packaging, the FPA wafer is mated and sealed to a corresponding "top-cap" wafer that is manufactured using similar IC and MEMS processing technologies as are used for the underlying ROIC/FPA wafer—often all of the steps being accomplished in the same IC/MEMS foundry.[1] There are packaging features and technology intermixed into the underlying FPA/ROIC wafer (e.g., the die itself forms the lower portion of the package, metal seal rings and getter layers are deposited on it, etc.) and, vice versa, there are pixel/FPA features in the top-cap window that are integral to the underlying FPA (e.g., features that complete the shielding for "blind" reference pixels that are needed for ambient temperature compensation.) With pixel-level packaging, MEMS processing techniques are used to create a tiny, individual micro-package around each pixel. Incidentally, the most advance work on pixel-level packaging for IRFPAs appears to be occurring outside the U.S.[2] Further, because of the precise spatial registration and correspondence needed amongst all the features, the entire set of mask designs, from the first ROIC layer all the way through to the last top-cap layer, are generally contained in a single CAD file. The proposed regulations would create an immediate need for numerous CJs to resolve this ambiguity for wafer-level and pixel-level uncooled microbolometer IRFPAs and the associated technologies to make them.

4. It is not clear that technology to create the high-integrity vacuum packaging that's needed for IRFPAs is any more or less widely available than the technology to make the pre-packaged FPA die. Indeed, there are many outside-the-U.S. ("O.U.S.") sources of IRFPAs, including several in non-WA countries (more on this below).

Note 1 to paragraph (c) doesn't help resolve any of the above and adds its own problems by not being clear (no bright line) in the following ways:

1. Regarding what constitutes "direct access to the IRFPA" and/or how to prevent it. Certainly "direct access" cannot mean optical or electrical access or there would be no way to use the encapsulated IRFPA.

2. Regarding what level of effort, due diligence and engineering is required to render an IRFPA sufficiently tamper proof to meet the requirements of Note 1.

---

[1] Early (1993) Honeywell patent on wafer level packaging for IRFPAs provides good overview of the concept. Of note, this is referenced by 110+ other patents, including numerous from outside the US; a good understanding of WLP can be obtained by following these 110+ links, available at https://www.google.com/patents/US5895233?dq=US5895233&hl=en&sa=X&ei=VyeTVb3VHJHaoASVkZnAAQ&ved=0CB0Q6AEwAA

[2] An example of LETI/ULIS pixel level packaging is available at http://proceedings.spiedigitallibrary.org/proceeding.aspx?articleid=1387339&resultClick=1

3. Regarding who has the burden of proof, what level of testing and analysis would be sufficient, and what the criteria would be required to meet Note 1.

All of the above would lead to multiple CJ requests to verify whether there is direct access to the IRFPA.

The definition of "multispectral" and associated controls proposed in (c)(6) are vague and thus do not provide a "bright line." The term "discrete output" in the definition of "multispectral" should be clarified. It is unclear if the following examples of IRFPAs would fall within this definition: (1) a broadband IRFPA integrally fitted with a filter or lenslet array with different band-pass characteristics for each of the lens/filter elements; i.e., analogous to a Bayer filter; (2) a microbolometer IRFPA where pixels have varying resonant absorption cavities that create varying spectral response.

III. The Proposed Rule Controls Items on the ITAR that are in Normal Commercial Use

a. Incorporation of an IRFPA into an infrared imaging camera core as a control parameter is not technically sound and will increase controls on cores in normal commercial use

The proposed inclusion of infrared camera cores in sub-category (c)(12) adds items on the USML that are in normal commercial use and creates ambiguity. Like IRFPAs, "cores" have well-established utility in both civil/commercial and military applications; they are inherently dual use and do not warrant control on the USML. Most importantly, IRFPAs are widely available, including in non-WA countries.[3]

---

[3] China (GWIC, etc) – Excerpts: ***Currently more than five Chinese companies*** and institutions design and fabricate uncooled infrared focal plane array. Some devices have sensitivity as high as 30 mK; the largest array ***for commercial products*** is 640×512 and the smallest pixel size is 17 µm. See Uncooled infrared focal plane array imaging in China.

China – (DALI) Excerpt: Since 2006, Dali…has brought several uncooled detectors into mass production, including 35um 384x288, 25um 160x120, 384x288, 640x480, and 17um 384x288, 640x480. See Uncooled infrared detector and imager development at DALI Technology.

Turkey (Mikrosens) – See A miniature low-cost LWIR camera with a 160×120 microbolometer FPA.

Israel (SCD) – Very wide range of IRFPAs commercially available, SWIR, MWIR and LWIR, **up to 1024x768**. (Note, website is for "SCD-USA LLC" but this is just a US sales/support office, these IRFPAs are all developed and manufactured in Israel). See http://www.scdusa-ir.com/ir-sensors/

France (ULIS) – In volume production with a wide range of a-Si uncooled microbolometer IRFPAs, **up to 1024x768**. See http://www.ulis-ir.com/index.php?infrared-detector=products.

France (Sofradir) – Very wide range of photon-detector IRFPAs for MWIR and LWIR – MCT, InSb, InGaAs and QWIP. See http://www.sofradir.com/.

Further (c)(12) has the following additional problems:

1. It appears as though a "core" ("e.g., module, engine, kit") is intended to represent some key subset of a camera but, defined as is proposed, **there is no meaningful difference between a "core" and a general-purpose camera**—certainly no "bright line." This flaw ultimately makes (c)(12) both potentially overly broad (capturing civil/commercial cameras) and ineffective (failing to capture possible defense items). Consider the following example: A "core" consisting of a 1024x768 pixel microbolometer IRFPA along with a specially designed lens and PCA/electronics. Suppose the electronics include an input connector for power and an output connector that provides imagery via a standard interface and format (e.g. HDMI). This "core" would appear to be captured under subparagraph (iii) of (c)(12). Consider now a general-purpose IR camera made from this core by adding a housing that is back-filled with epoxy potting compound so the IRFPA, lens and PCA cannot be removed without destruction or damage to the "core." Following Note 2 to paragraph (c)(12), this general-purpose camera would now be EAR controlled; however, there is no meaningful functional difference whatsoever between it and its ITAR-controlled "core." Ironically, the added ruggedness provided by the housing and potting might in fact make this "camera" even more suitable for military uses than its "core."

2. Indeed, *any* infrared camera, system or product will inevitably include at least enough electronics "to enable as a minimum the output of an analog or digital signal once power is applied;" i.e., to comprise a "core." Therefore *any* such camera, system or product that has an IRFPA or other characteristic that meets the criteria identified in the eleven sub-items to paragraph (c)(12) will ultimately be ITAR controlled unless modified in some way (i.e., made tamper proof) to meet Note 2 to paragraph (c). There are numerous existing civil/commercial IR camera systems that are not presently tamper proof per Note 2 that will become ITAR controlled under the proposed paragraph (c)(12). One example is the Fluke TiX1000 (1024x768 civil/commercial camera).[4]

3. Modifying civil/commercial IR camera designs to make them tamper proof per Note 2 to paragraph (c) would be a tremendous burden on U.S. industry that would make U.S. IR camera products more difficult and expensive to manufacture and difficult or impossible

to service—ultimately making U.S. products less competitive globally. Further, it is not at all clear (no bright line) on what level of effort, due diligence and engineering is required to render an item sufficiently tamper proof to meet the requirements of Note 2.

4. The weapon shock load event control parameter described in subparagraph (ii) is problematic on many levels. Many civil/commercial IR camera systems have rigorous ruggedness requirements. Firefighting cameras must work in very harsh environments and are designed to survive very rough handling. Many portable thermography cameras for industrial applications are specified to survive a two-meter drop.[5] Because of the aforementioned problems with the ambiguity between cameras and cores, it is not necessarily clear these civil/commercial products are not "cores" captured by (c)(12). These civil/commercial cameras have generally not been tested against the proposed weapon shock parameters so it is not known if they would pass or fail. Numerous questions will be raised if the proposed control went into effect:

    a. Would the manufacturers of these cameras need to test their existing and/or new designs to prove they cannot survive this weapon shock specification?

    b. Who has the burden of proof and what level of testing and analysis is sufficient? What equipment is needed to do the testing?

    c. What if some units of a particular model survive and some units fail due to normal manufacturing variation?

    d. Would assuring a model doesn't pass the weapon shock test make it less rugged and potentially less competitive than competing O.U.S. models that don't face this requirement?

Additionally, this parameter would be especially troublesome in applications where ruggedness is a perceived advantage. Further, it is not necessarily clear how to ensure an IR camera reliably fails the weapon shock test but meets the ruggedness requirements of the aforementioned civil/commercial applications. Achieving this would certainly add

http://www.isgfire.co.uk/

https://www.scottsafety.com/en/us/Pages/ProductDetail.aspx?productdetail=Eagle+Attack+Thermal+Imaging+Camera cost and complexity to U.S. products versus O.U.S. products that don't face this requirement. Finally, at least one U.S. manufacturer has filed for patents[6] in this area, so this proposed control could even end up favoring one U.S. manufacturer versus other U.S. manufacturers.

5. In subparagraph (iii), referencing both (c)(2) and (c)(5) adds uncertainty to exactly what the "permanent encapsulation" aspect is intended to distinguish. Given that microbolometer IRFPAs must be encapsulated simply to function, any microbolometer-based "core" would always be encapsulated, so the introduction of a control parameter based on encapsulation introduces confusion. It is not clear what is being addressed with the reference to (c)(2) versus (c)(5). There are analogous issues with the other sensor types (photon detector, etc.) in subparagraphs (iv) – (xi). At minimum, it's unclear and unnecessarily complex.

6. Paragraph (c)(13) uses terms that are not clearly defined and that potentially capture civil/commercial products:

    a. Numerous handheld/portable industrial thermography cameras have a camcorder style eyepiece that, without further clarification, probably would be considered a near-to-eye display.[7] This is needed for adequate viewing while outdoors in bright sunlight conditions. It is not clear whether these systems would be considered "monoculars" or "video-based articles having a separate near-to-eye display?" There is no definition of a "video-based article?" The "near-to-eye display" term is also used in (c)(18), introducing the same uncertainties to that sub-category.

    b. Many IR cameras (and visible cameras) have connectivity options that enable them to work with commercial, off-the-shelf head-mounted display glasses (e.g. such as google glass, gaming systems, etc.), either directly or indirectly via connections with smartphones or other devices that can easily be coupled with the above commercial displays. This control needs further work to distinguish widely available commercial/consumer head-mounted display options such as the above from those used for military purposes.

7. In subparagraph (c)(16)(iii), any general-purpose IR camera could potentially be considered appropriate equipment for a "fixed-site reconnaissance, surveillance or

[7] Some examples of Civil/Commercial IR cameras with near-to-eye display are available at:

http://en-us.fluke.com/products/infrared-cameras/tix1000-infrared-camera.html

http://www.flir.com/science/display/?id=46792

http://www.flir.com/ogi/display/?id=55671 perimeter security system." It is generally the peripheral equipment (e.g. housings, interfaces, back-end software/analytics, etc.) that distinguish such systems from commercial or industrial systems for process control, R&D, etc. Because of this, as presently written, the proposed control potentially captures any IR camera that meets the pixel/format specification—perhaps even hand-held, portable thermography cameras (e.g. if fixed-mounted on a tripod, enclosed in a housing and/or connected to line power). Further work is needed here to clarify this. As is discussed in more detail below, this subparagraph is an example of using detector format as a control parameter that, to be balanced and effective, needs a clear, objective process for periodically reviewing and adjusting the parameter as the O.U.S. availability of larger format IRFPAs inevitably advances.

8. Paragraph (c)(19) appears to be intending to control scene projector equipment that is used for hardware-in-the-loop testing of military systems; however it is overly broad as written. It should be clarified to make it clear it does not include equipment such as calibrated blackbodies that are routinely used to project radiometrically calibrated *uniform* scenes in the manufacturing and calibration processes for virtually all IR imagers and radiometric thermography cameras.

b. ***The attempt to distinguish and divide jurisdiction of packaged IRFPAs in Category XII(c) based on number of detector elements is flawed and will likely capture items that are not controlled on the Wassenaar Arrangement or are in normal commercial use***

While it is generally reasonable and accepted that systems using larger-format IRFPAs can convey some advantages for warfighters versus systems with smaller-format IRFPAs, for this to be effective as a unilateral U.S. control, it is crucial that it be set at the right level -- a level that accurately reflects what is available in the U.S. versus outside the U.S. ("O.U.S."). Further, for this to be appropriately balanced there would need to be a clear, objective process for periodically reviewing and adjusting the parameter as the O.U.S. availability of larger format IRFPAs inevitably advances. As it is, the proposed regulation offers no such review/adjustment process.

The proposed limits in (c)(3) and (c)(4) appear arbitrary and inconsistent. With appropriate scanning, a 640-1 linear array can easily be used to create a 640xN two-dimensional image. With no consideration of other factors such as frame rate, it is illogical to suggest a 129x2 pixel IRFPA conveys a significant military advantage versus a 640x1 array.

The proposed limit of 328,000 detector elements in (c)(5) is not appropriate given the significant O.U.S. availability of larger IRFPAs (e.g. 1024x768).[8] These items are in normal commercial use outside the U.S. and are not controlled on the Wassenaar Munitions lists.

---

[8] See, for example, above references for ULIS and SCD.

c. ***The proposed controls for IRFPA wafers and Readout Integrated Circuits are overly broad and capture items in normal commercial use and readily available O.U.S.***

The proposed controls for IRFPA wafers and Readout Integrated Circuits ("ROICs") in subparagraphs (e)(3), (4) and (5) are overly broad and flawed for similar reasons as identified above. In particular:

1. Their wide availability from sources outside the U.S. All of the O.U.S. IRFPAs previously noted have ROICs that originate from outside the U.S. Further, there is widespread literature in the public domain about the details of ROIC design.[9]

2. Here, yet again, is another example of using detector format as a control parameter, which to be balanced and effective needs a clear, objective process for periodically reviewing and adjusting the parameter as the O.U.S. availability of larger format IRFPAs inevitably advances. Further, there is no clear reason why the control limit should be different for ROICs than for the IRFPAs associated with them (19,200 pixels versus 328,000 pixels).

3. It appears (e)(4)(iii) is intended to leave 160x120 and smaller format microbolometer ROICs to be controlled by the EAR. If that is the case, the parameter should be increased somewhat, to at least 21,000 pixels, to accommodate the extra reference and boundary rows and columns that are typically included on IRFPAs. Alternately, 32,768 might be more appropriate given the widespread use with consumer smartphones of 208x156 format IRFPAs.

4. Further, it is not clear what ROICs are captured in (e)(5) that are not already captured by (e)(4). Having multiple subparagraphs that potentially capture the same ROIC

---

[9] For example, a quick search of SPIE's digital library with the terms "infrared" and "ROIC" yields 456 hits.

http://proceedings.spiedigitallibrary.org/solr/searchresults.aspx#q=infrared%20ROIC&SearchSourceType=1

A few specific examples

Turkey –

A 1280×1024-15µm CTIA ROIC for SWIR FPAs

A 640×480-17µm ROIC for uncooled microbolometer FPAs

MT3825BA: a 384×288-25µm ROIC for uncooled microbolometer FPAs

MT3250BA: a 320×256-50µm snapshot microbolometer ROIC for high-resistance detector arrays

MT6415CA: a 640×512-15µm CTIA ROIC for SWIR InGaAs detector arrays

MT6425CA: a 640 x 512-25µm CTIA ROIC for SWIR InGaAs detector arrays

(component) only serves to makes these already complex regulations even more complex and confusing.

5. Subparagraph (e)(6) is problematic on several levels. The multiple references to paragraph (c) make it confusing and unclear.

    a. A typical "vacuum package" for a microbolometer IRFPA consists of some kind of package body (typically metal or ceramic) and an IR-transparent window. Neither of these components is, by itself, a "vacuum package or sealed enclosure," so apparently neither would be controlled in this subparagraph. These components do become a "vacuum package" when sealed together and evacuated—ostensibly with an IRFPA die inside. However, once that is done, the combination of package body, window and IRFPA die is actually an encapsulated IRFPA which is already addressed in paragraph (c). So, as written, subparagraph (e)(6) either misses its mark and is a null set, or is redundant to paragraph (c).

    b. On the other hand, if one assumes that (e)(6) was intended to refer to the package body (or window), that still does not fully resolve the ambiguities. Consider, for example, a package body designed for a 320x240 microbolometer IRFPA die that is controlled in (c)(2). Whether or not the package is controlled in this subparagraph then hinges on whether it is "specially designed" for incorporation or integration *into any* article controlled in paragraphs (a), (b) or (c).

       The IRFPA die itself is controlled in (c), so following one confusing and circular—but possible—path, the classification then hinges on whether the package was "specially designed" for this IRFPA and, assuming it was, whether the package is being incorporated "into" a controlled item. If "into" is interpreted narrowly, it could be argued that the package does not get incorporated or integrated "into" the die, so therefore, the package is not controlled by this subparagraph. On the other hand, taking a slightly broader view of "into," the package is certainly integrated with the die, in which case the package would be controlled. At a minimum, the intent behind this paragraph should be clarified, or possibly it should be removed.

    c. Assuming the previous two items are addressed, another example illustrates yet another problem with this subparagraph. Consider a package body and/or window used with a 1024x768 microbolometer IRFPA. Since this IRFPA die is controlled in (c)(2) and, when packaged, it is controlled in (c)(5), it appears this package and window would be controlled by this subparagraph. However, there is a strong argument that the package for a microbolomer would not meet the "specially designed" test, because the only difference between a package for a smaller and a larger format microbolometer consists of adjustments for "fit" only.

       A package and window for a 1024x768 IRFPA are simply slightly larger versions of what would be used for smaller microbolometer IRFPAs (e.g. with fewer than 328,000 pixels). The technology and know-how needed to make them are identical, except for adjustments for "fit", as defined in connection with the

> "specially designed" release paragraph (b)(3). Indeed, a package and window developed for a 640x480 IRFPA with 25-micron pitch could potentially be used very effectively for a 1024x768 or larger IRFPA with 12-micron pitch, with adjustments only to accommodate the different size. In this case, assuming the 640x480 package was not "specially designed" for some other article in (a), (b) or (c), it would be EAR controlled while there appears to be an intent to control its 1024x768 counterpart under the ITAR. However, the "catch-and-release" provisions of the "specially designed" provisions would appear to make this category, and subparagraph (e)(6) a null set, at least with respect to microbolometers.

Paragraph (e)(10) is unclear and overly broad. Virtually any IR camera that uses an IRFPA will have some portion of its electronics that "drive," "control" and/or "image process" data from the IRFPA. Since the electrical interface of an IRFPA varies at least in details from manufacturer to manufacturer and model to model, at least some portion of the IR camera electronics is always unique for interfacing to a particular IRFPA, so there is a good chance that these items would be considered "specially designed," but it is likely that CJs would be required to clarify what is and is not controlled. Thus, as written, subparagraph (e)(10) could control at least some portion of the electronics of any IR camera that uses an IRFPA controlled in this category – even an EAR-controlled camera that has been decontrolled. It is not clear the extent to which the traditional "see-through" concept would serve to pull back an otherwise EAR camera that contains such drive, control, or image processing electronics, or whether Category XII should be interpreted more along the lines of the EAR – i.e., that classification of an end-item is done based on its characteristics, not based on incorporated controlled components.

If the see-through concept applies, in order for a civil/commercial IR camera to be EAR controlled, a manufacturer would need to identify exactly which portion of the camera electronics is "specially designed" for the IRFPA (which is not at all clear), and then make that portion tamper proof according to the Note to paragraph (e). As discussed above, how to make something sufficiently tamper proof is not at all clear. Worse still, a manufacturer would also need to determine whether the electronics that "drive," "control" and/or "image process" data from the IRFPA are "specially designed" for the IRFPA die controlled in (c)(2) or the packaged/encapsulated IRFPA controlled elsewhere in (c); e.g., in (c)(5). If anything, the electronics really has little to do with the packaging and is more logically associated with the IRFPA die controlled in (c)(2). Since (c)(2) controls practically every IRFPA the end result of the analysis could be that every IR camera would be caught up in this conundrum. In light of the apparent intent to decontrol certain types of cores and cameras, we doubt that this is what DDTC and the interagency partners intended, but greater clarification of the proper approach to classification, and the applicability of the "see-through" concept is required to avoid uncertainty and unintended consequences.

Subparagraph (e)(11)(ii) is unclear and overly broad. There is no definition of what constitutes a "target" in the explanatory note. It is not clear whether this refers to tactical "targets" associated with weapons control or aiming systems, or if it could mean "targets" such as deer, children, or other vehicles, in the context of collision avoidance systems for civilian automobiles. The use of "multi-sensor fusion" as a control criteria seems to ignore numerous examples of civil/commercial IR cameras that already include what industry would consider "multi-sensor fusion," and which have a wide range of image processing approaches for combining the imagery, not just "image blending."[10] Some examples include picture-in-picture, alpha-blending (averaging) and threshold-based algorithms applied on a pixel-by-pixel basis. In some cases a high spatial frequency filter is applied to the image data from one or more sensor (e.g. to extract edges) and then the filtered (edge) data is combined with data from the other sensor(s). It is not at all clear if all of these approaches would be considered "image blending." If not, to achieve or retain EAR control for these IR cameras, it appears a manufacturer would be left to identify and tamper proof the portions of the camera electronics that provide these functions—which has its own set of problems, as already discussed above.

Paragraph (e)(12) is also unclear and overly broad. Existing civil/commercial cameras include camcorder style eyepieces that may or may not be "near-to-eye" displays. This was already discussed in detail with respect to Paragraph (c)(13).

B. TECHNOLOGY AND DEFENSE SERVICES

Control of thermal imaging technology is a challenge under the current ITAR and EAR. Given that the CCL controlled cameras contain USML controlled IRFPAs there is already a jurisdictional split for hardware and related technology. The EAR Revisions only compound the confusion by further splitting jurisdiction. Additionally, the proposed revisions are so complicated that exporters will be forced to submit CJs in order to find the bright line.

I. The Proposed Rule Adds Complexity to Paragraph (f) and Does Not Establish a Bright Line Between the USML and CCL

The complex and interwoven notes to paragraph (f) appear to be an attempt at clarifying and distinguishing technology to *make* IRFPAs from technology needed to *use* them. This added complexity is only necessary because of the proposed structure in (c) and (e) that would keep unpackaged IRFPAs and wafers controlled under the ITAR while some packaged/encapsulated IRFPAs would be controlled under the EAR. Unfortunately, the proposed language misses its mark and only adds to lack of clarity and issues identified in (c) and (e). U.S. IRFPA manufacturers will not gain any benefit from certain IRFPAs and cores being EAR-controlled if

---

[10] Some examples of civil/commercial systems with multi-sensor fusion that may go beyond mere "blending" are available at:

http://en-us.fluke.com/products/infrared-cameras/fluke-ir-fusion-technology.html

http://www.flir.com/instruments/display/?id=61194#videobox the information and software needed to use them efficiently and effectively remains ITAR controlled. It needs to be made clear that the IRFPA maker can provide a complete set of operating information for the IRFPA. Some examples of essential operating information include:

- Definition of and spec limits for all electrical I/O connections, biasing, integration, etc.
- Format and timing of input and output data/interfaces
- Definition and operation of any on-chip control or status registers
- Operating and calibration info for any on-chip non-uniformity correction and/or ambient temperature compensation functionality
- Application notes that describe how to adjust the inputs (bias and integration settings, etc.) to optimize performance (e.g. for best NETD and/or scene dynamic range) over the specified operating ambient temperature range
- Mechanical drawings and/or CAD models showing FPA location and optical center referenced to mounting datum
- Circuit simulation models (e.g. SPICE models)
- Assembly and handling requirements/limits for mounting and connection to PCA
- Performance specifications (e.g., NETD, responsivity, uniformity, scene dynamic range, pixel operability, vacuum lifetime, pixel time constant)
- FPA test and/or calibration data – e.g. output data obtained by operating FPA over range of ambient temps and scene temps

Part A of note 2 to paragraph (f) and the accompanying *"note to paragraph A of note 2 to paragraph (f)*" defines the information and data that would and would not be subject to ITAR technical data controls. In a nutshell, it is too vague regarding what is ITAR controlled and still leaves a significant gray zone (no bright line). In particular:

1. The exclusion in "Note to paragraph A of note 2 to paragraph (f)" limiting to "basic" operating instructions is vague and too narrow. Distinguishing between a "basic" operating instruction from, say, an intermediate or advanced one is completely subjective and there is no "bright line." The IRFPA user (e.g. camera developer) needs access to sufficient information to effectively use the part or it is totally useless. Instead, all operations technical data should be excluded.

2. Requiring that the information *not* include "design methodology," "engineering analysis" or "manufacturing know-how" is also too vague and limiting. While these terms are, in fact, defined in part 125.4, the definitions mostly just provide examples of information that *would* be encompassed by these terms (and thus could not be provided via EAR controls) without providing a very clear picture of what is not encompassed and *can* be provided. Worse still, "engineering analysis" specifically includes simulation and computer models—both of which are important elements for efficient and effective *use* of an IRFPA. An IRFPA user (e.g. IR camera designer) needs to understand the overall

architecture of the device and have access to, at least, a circuit simulation (e.g. SPICE) model of the IRFPA to enable efficient and effective design of an IR camera system.

3. The note addresses *technical data* but is completely silent on *defense services*. The definition of defense services includes "furnishing of assistance (including training) … in the … *testing, operation, or use* of defense articles." A U.S. IRFPA manufacturer cannot compete effectively if it cannot provide customer support and assistance on how to use or operate its IRFPAs. We recognize that DDTC has also proposed revised definitions of "defense services", but those changes are not yet implemented; additional guidance in Category XII about the exclusion of the provision of assistance with the operation of an IRFPA from the scope of Category XII(f) would provide needed clarification.

Part B of note 2 to paragraph (f) appears to be inconsistent with proposed definition changes that would remove software from the scope of "technical data" under the ITAR. See RIN 1400-AD70, revised definition of "technical data." We assume that the final Category XII controls would be adjusted in light of the proposed change to have a separate sub-category controlling software. This paragraph indicates that software that "converts" an article controlled in category XII to one subject to the EAR is still controlled under the ITAR. This is also vague and unclear. The concept of software that "*converts*" an ITAR item to an EAR item needs to be more clearly distinguished from software that is simply *used* with an ITAR item that has been incorporated into an EAR item. To hazard a guess, it seems this note may have been intended to control software that plays a role in preventing a core with an IRFPA from meeting the gunfire shock spec discussed in (c)(12)(ii), or perhaps software that otherwise downgrades an ITAR-controlled item by limiting other aspects of its performance.

However, as written it, either misses the mark for this or is so broad as to potentially capture every commercial IR camera that uses an IRFPA controlled in (c)(2). Any core that is designed to meet the gunfire shock spec will likely have software *and* hardware (e.g. accelerometer sensors and associated circuitry) involved, so it could easily be argued that the software, *by itself*, does not "convert" what would have been an ITAR-controlled core into an EAR-controlled one. On the other hand, if the software merely needs to play a role in converting the ITAR item to an EAR-controlled item, then every commercial IR camera that uses an IRFPA controlled in (c)(2) will potentially have ITAR-controlled software. (Even if the IRFPA is encapsulated and subject to EAR control, Note 1to paragraph (f) clearly indicates that tech data that directly relates to an ITAR item remains ITAR controlled, even if it could also apply to an EAR item.)

As discussed above, the technical data (and software) used to operate an IRFPA needs to have the same jurisdiction and controls as the IRFPA itself. To be competitive, U.S. IRFPA manufacturers need to be able to provide the information needed to operate the IRFPA. Often, this includes software modules and/or drivers so the IRFPA user does not need to reinvent these. Further, manufacturers of civil/commercial IR cameras cannot efficiently develop and support their products if there is ambiguity whether the camera software (including the portion that operates the IRFPA) is ITAR controlled. For larger companies with globally dispersed development teams, this creates ambiguity about what controls need to be in place among the various teams. Worse still, it potentially creates a situation where an ITAR license would be required to provide something as simple as a bug-fix software update for a civil/commercial EAR-controlled IR camera.

Part C of note 2 to paragraph (f) is also vague and overly broad. In particular:

1. As discussed above, models and tools to simulate the output of an IRFPA are basic and fundamental to designing an IR camera that uses the IRFPA. It needs to be clear that these are included in the information to operate the IRFPA.
2. Simulation of radiometrically calibrated spectral signatures and volumetric effects of plumes has numerous civil/commercial applications and would be fundamental to developing industrial and environmental gas imaging systems.

Note 3 to paragraph (f) is an additional part of the illogical attempt to draw the EAR/ITAR line for IRFPAs by distinguishing those in a "permanent encapsulated sensor assembly" from those that are not. As discussed above, this is fraught with problems and instead would create a vast gray zone and a need for countless CJs—especially for wafer-level and pixel-level packaging technologies in use with microbolometer IRFPAs.

C. EAR REVISIONS

I. Creation of new ECCNs to control items that are currently EAR99 and rollback of License Exception availability for EAR-controlled items is contrary to ECR goals

The title of the EAR Revisions states that this rule shall remove from the USML those items that the President determines no longer warrant control on the USML. To the contrary, it appears that this revision of the EAR creates new controls on items that were not previously controlled, increases licensing requirements, removes availability of license exceptions and even imposes a presumption of denial for certain items. The proposed revisions are contrary to Export Control Reform, will create an administrative burden on the civil/commercial industry, and will place U.S. companies at a competitive disadvantage.

a. Proposed Revisions to Part 740 and 742 Increase Controls and Restrict Licensing

The imposition of worldwide licensing requirements and removal of STA eligibility for 6A002, 6E001, and 6E002 items undermines the flexibility of EAR controls on commercial thermal imaging devices, and would negatively impact the competitiveness of U.S. industry by burdening its ability to work cooperatively, even internally within corporate affiliates located in the European Union and other Wassenaar Arrangement countries.

The EAR rule creates several new unilaterally controlled ECCNs, or revises unilateral ECCNs to control items that are not currently controlled, such as 0E987, 6A990, 6A994, 6E990, 6D994 and 6E994 and where the U.S. Government has provided no reasoned basis to justify why proposed worldwide Regional Stability controls are appropriate. If the U.S. Government truly believes that the need for worldwide control of such items and technologies is self-evident, then our multilateral partners must surely agree. If these items are truly highly sensitive, then it would seem to be more appropriate to propose controls for them through the Wassenaar Arrangement. If there are compelling arguments favoring worldwide control, then certainly these efforts would be successful. This makes more sense than imposing unilateral controls, and would place U.S. industry on a more level playing field, at least with respect to foreign competition in Wassenaar Arrangment countries. If our multilateral partners do not agree that controls are appropriate such items should be subject to no greater than EAR99 or AT-level control. Additionally, placing such controls on items, software and technology that are already widely available throughout the world, is illogical and will create an administrative

As with the ITAR proposed changes, key definitions are lacking, such as what criteria make an item a "weapon sight" or establishing clear criteria as to what items are "military" items to be controlled by the 600 series versus those in normal commercial use.

These changes are also inconsistent with the goals of ECR, which include facilitation of cooperation with multilateral regime partners, and not imposing new export controls on items without clear national security justification and a push for multilateral controls.

Practically speaking, these changes will dramatically increase the administrative burden of U.S. industry and BIS. Multinationals that are now employing STA to support foreign subsidiaries in R&D, manufacture and service will now have to apply for licenses that may now be denied based on the proposed presumption of denial in 742. 6(b)(iv).

b. Proposed Revisions to Section 744.9 will Impede Industry's Ability to Compete

Managing sales that are subject to Section 744.9 is already a challenge. The proposed revisions will significantly increase the complexity and burden on the U.S. thermal imaging industry. Many infrared cameras controlled by 6A993 are low-cost, consumer goods that are distributed internationally, often through multiple distributors and sometimes sold in storefronts and on-line. At the time the U.S. company sells these goods to the distributor they typically do not know the end-user or end-use. With the addition of the "is unable to determine whether" language, Fluke is uncertain if we can even continue selling these cameras via the distribution model given this proposed language.

Notwithstanding the new language, adding 6A993 to the list of items subject to 744.9 will be an overwhelming administrative/resource burden to implement proper controls. New processes, forms, training, and audits internally and with all global subs to control for this rule will be required. The increased administrative burden on distributors will hinder sales of these items, especially for 6A993.a cameras, and cause a competitive disadvantage

D. CONCLUSIONS

Overall, we conclude there are fundamental flaws in the proposed rules, which undermine the policy objectives of Export Control Reform, and the objectives of the U.S. export control regime in general.

- The proposed rules impose controls on items that are currently controlled as EAR99 and/or are in normal commercial use, expanding the extent of controls with respect to commercially available thermal imaging devices, software, and technology.

- The proposed rules are unnecessarily complex and do not establish clear lines between USML and EAR controls, lack clear definitions, or differentiate controls based on parameters that do not make sense from an industry or technical perspective. This makes the rules more difficult for companies to understand and administer internally, and does little to simplify U.S. Government enforcement efforts. The proposed changes will likely increase, rather than decrease, the need for industry and enforcement agencies to request CJ and CCATS determinations to determine what controls actually apply to night vision devices. Provisions so complicated that explanatory notes need to be explained by additional explanatory notes almost guarantee misinterpretation.

- Unjustified reductions in License Exception eligibility and the establishment of more unilateral U.S. export controls on night vision items will further reduce the ability of U.S.-based companies to work effectively with affiliates located in Wassenaar Arrangement countries, undercutting the goals of ECR to facilitate interoperability and co-development of products with regime partners. If ECR can facilitate cooperative development of major weapons systems with our allies, such as military aircraft, missiles, and warships, it should also be able to do so with respect to military thermal imaging systems, let alone with respect to EAR-controlled thermal imaging systems. Given the worldwide availability of such technology, there is no apparent justification for treating thermal imaging devices any differently in the context of ECR.

- The overall effect of these controls will likely be to reduce the competitiveness of U.S. industry, sheltering foreign competitors and enabling them to gain a greater share of the commercial and military markets. This may lead to increased costs for the U.S. government, potential loss of U.S. technological edge, and ultimately to greater U.S. government reliance on foreign-sourced thermal imaging commodities. Fastening the export control tethers too tightly, without regard to existing foreign availability and the intertwined relationship between a healthy U.S. commercial thermal imaging industry and a healthy U.S. military industry, may unintentionally transform those tethers into a noose, choking off a key source of important tactical technology for the U.S. government, while simultaneously pushing good U.S. jobs offshore to foreign competition.

Thank you once again for the opportunity to provide comments on this proposed rule. We would be pleased to discuss any of this with DDTC.

Submitted on Behalf of Fluke Corporation by,

Matthew Schmidt, Director, Business & Technology Development

Washington, DC 20230

Department of State
2201 C St NW
Washington, DC 20520

Dear Sirs/Madams:

We would like to thank the Department of State and the Department of Commerce for the opportunity to comment on the proposed changes to the US export controls relating to USML Category XII.

In reviewing the proposed rules, we strongly believe that fundamental changes are required in order to best serve the U.S., protecting national security by controlling sensitive technologies while supporting US participation in fast growing commercial markets for dual-use products.

We find that the proposed Category XII rules lack adequate control criteria and that such criteria do not exist and cannot be positively established. As detailed in Sections 1 and 2 below, we strongly urge that many rules be rewritten with “specially designed for military use” as the fundamental criteria to replace the proposed control criteria.

In addition, we suggest that the BIS companion rule is not necessary given that there is already a national security control for all items. The 600 series created in the companion rule should be eliminated or reintegrated into the USML as this creates an additional layer of regulation which serves no purpose other than to implement munition type controls at commerce.

Again, we thank the Department of State and the Department of Commerce for the opportunity to comment on these important changes and would welcome the chance to discuss these comments in greater detail should further clarification be required.

Respectfully submitted,

Frank Vallese, Sc.D.

Comments on the Proposed Changes to Export Controls for Category XII and related BIS Bookends

Contents

Overview:

We appreciate the Administration's hard work to improve US export controls. These changes are needed to increase interoperability with our NATO allies, increase transparency and fairness amongst exporters, reduce incentives to avoid US content by non-US manufacturers and to focus export control resources on articles of significant concern. For Category XII articles, it is particularly challenging because the laser and sensor technologies have critical military importance as well as significant commercial application. Extra-tight U.S. export controls have had unforeseen consequences that have disadvantaged many U.S. manufacturers in the global marketplace while strengthening foreign competitors. Export Control Reform provides the opportunity to correct these errors and right-size the rules so that they not only protect our technology but also protect the health of the industry.

In reviewing the rewritten Category XII draft, we see several fundamental flaws:

1) The proposed rules do not establish a "bright line" between USML and CCL products. The proposed rules show a line that is not only improperly position but also lacking clarity concerning the jurisdiction of the articles. Control criteria (FOMs) are given that are not well-defined and have no bearing on distinguishing military use products from dual-use products.
2) In identifying certain items as the "crown jewels" of US technology to be better protected by ITAR controls, it appears that many dual-use products have inadvertently been captured as well. While the articles may have technological importance (e.g. night vision subsystems), their dual-use nature (thermal imaging systems with commercial applications) cannot be ignored. Even if those technologies are seen as critical to US defense, the availability of the technology outside the US and the significant foreign availability of related products needs to be considered before classifying them as "crown jewels" and controlling them with restrictive munitions policies, ignoring their dual-use disposition. Otherwise, by capturing dual-use items on the USML, the US government undermines the ability of US industry to adequately participate in fast-growing international commercial markets, whereby they may leverage increased production to decrease costs and fuel further technological development. This is unilateral control and has adverse consequences.
3) In the proposed rules, the US has labeled certain articles as USML or CCL 600 Series (with ITAR-like control) even though they are controlled as dual-use items by our Wassenaar partners and classified on the Wassenaar Dual-Use List. This is inconsistent with the intended ECR goal to increase interoperability with NATO and other close allies. Without a level playing field amongst the US and its allies, US products will be avoided because of their inconsistent level of control when compared to other countries.

In the following two sections, specific comments, suggestions and requests for clarification on the proposed rules are provided. The detailed comments refer to those proposed rules that are felt to require updating. Each includes a short statement of the issue with the proposed rule's language, a discussion or reasons supporting the issue and recommendations.

Recommendations:

We strongly support export control reform relating to USML Category XII. Yet, we believe that the proposed rules require fundamental change in order best serve the U.S., protecting national security and controlling sensitive technologies while supporting US participation in fast growing commercial markets for dual-use products.

We find that the proposed Category XII rules lack adequate control criteria and that such criteria do not exist and cannot be positively enumerated. As detailed in Sections 1 and 2 below, we strongly urge that many rules be rewritten with "specially designed for military use" as the fundamental criteria to replace the proposed control criteria.

In addition, we suggest that the BIS companion rule is not necessary given that there is already a national security control for all items. The 600 series created in the companion rule should be eliminated or reintegrated into the USML as this creates an additional layer of regulation which serves no purpose other than to implement munition type controls at commerce.

Section 1: Detailed Comments to Amendment to the ITAR, Revision of USML Category XII
http://www.regulations.gov/#!documentDetail;D=DOS_FRDOC_0001-3226

Comment 1 Section: XII(a)(9)

Issue: This text could capture hands-free thermal imaging cameras which are actively being developed for firefighting applications. These hands-free thermal imaging cameras have been available in the past. For example, FireFLIR, a product introduced by FLIR, and a helmet-mounted device by Cairns. Newer models are expected to have infrared cameras mounted to the helmet with the HMD attached to the breathing apparatus.

Recommendation: Revise the proposed rule to: "Helmet mounted display (HMD) systems or equipment *specially designed for military use*, incorporating optical sights or slewing devices, which include the ability to aim, launch, track, or manage munitions, or control infrared imaging systems or equipment, other than such items controlled in Category VIII, (e.g., Combat Vehicle Crew HMD, Mounted Warrior HMD, Integrated Helmet Assembly Subsystem, Drivers Head Tracked Vision System)."

Comment 2 Section: XII(c)

Issue: The section (c) title is confusing. "Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:". It includes physical items (e.g. "image intensifier tubes"), applications (e.g. "night vision") and generic classifications (e.g. "electro-optic"?).

Recommendation: Choose a more generic category title that is clear and balanced.

Comment 3 Section: XII(c)(2)

Issue: Should the rules separately consider packaged and unpackaged IRFPAs?

Discussion: Regarding the separate consideration of packaged and unpackaged IRFPAs, there does not appear to be a large market today for unpackaged IRFPAs. So, the point seems rather moot. In addition, I believe a clarification is required for devices that incorporate the package in the detector manufacturing process, such as wafer-level-packaging and pixel-level-packaging. With the motivation to build smaller devices with lower cost, innovative technologies will likely be introduced and so the distinction needs to be clarified.

Recommendation: Modify the text to clarify how devices are controlled when the packaging is incorporated into the IRFPA.

Comment 4 Section: XII(c)(3)

Issue: The number of detector elements is not a criteria that delineates dual-use and military use encapsulated one-dimensional photon detector IRFPAs.

Reasons:

1) The detector is a dual-use device. Common commercial applications include: dense wavelength division multiplexing (DWDM), remote sensing (vegetation, clouds, humidity, atmospheric conditions), wild fires, radiometry.
2) The pixel count constraint has no specific military significance.
3) These are listed on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Xenics Xlin-17-3000 (http://www.xenics.com/en/xlin-17-3000)

   b. Hamamatsu (http://www.hamamatsu.com/jp/en/product/category/3100/4005/4208/4121/index.html)

Recommendation: Revise the proposed rule to: "One-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly~~, having greater than 640 detector elements~~ *and specially designed for military use;*"

Comment 5 Section: XII(c)(4)

Issue: The number of detector elements is not a criteria that delineates dual-use and military use encapsulated two-dimensional photon detector IRFPAs.

Reasons:

1) The detector is a dual-use device.
2) The pixel count constraint has no specific military significance.
3) These are listed on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
   a. Xenics XFPA-1.7-640-LN2 (http://www.xenics.com/en/xfpa-17-640-ln2)
   b. Hamamatsu (http://www.hamamatsu.com/jp/en/product/category/3100/4005/4208/4121/index.html)
   c. Chunghwa Telecom (http://www.leadinglight.com.tw/images/Large%20format%20FPA%20spec.pdf)
   d. SCD (http://www.scd.co.il/SCD/Templates/showpage.asp?DBID=1&LNGID=1&TMID=108&FID=1287&IID=1682)

Recommendation: Revise the proposed rule to: "Two-dimensional photon detector IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly~~, having greater than 256 detector elements~~ *and specially designed for military use*;"

Comment 6 Section: XII(c)(5)

Issue: The use of array size to identify those encapsulated microbolometer IRFPAs that are for military use is not appropriate. Encapsulated microbolometer IRFPAs having more than 328,000 detector elements are dual-use and commonly used in commercial applications.

Reasons:

1) The detectors are dual-use devices. Commercial applications include: commercial automotive vision, UAVs, security, thermography, scientific research.
2) Constraining the array size has no specific military significance.
3) These are listed on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
   a. ULIS PICO-1024 (http://www.ulis-ir.com/index.php?infrared-detector=gen2pico1024)
   b. SCD Bird-XGA (http://www.scd.co.il/Bird-XGA-17)

Recommendation: Revise the proposed rule to: "Microbolometer IRFPAs described in paragraph (c)(2) of this category in a permanent encapsulated sensor assembly~~, having greater than 328,000 detector elements~~ *and specially designed for military use*;".

Comment 7 Section: XII(c)(7)

Issue: The use of an array dimension to identify those charge multiplication FPAs that are for military use is not appropriate or consistent with their use. Charge multiplication FPAs having greater than 1,600 elements are commonly used in commercial applications and must be treated as dual-use.

Reasons:

1) The detectors are dual-use devices. Commercial applications include: enhanced underwater imaging, life science imaging applications (such as single molecule detection, live cell fluorescence microscopy, ion signaling and weak luminescence detection), photon counting, adaptive optics, single molecule detection, neutron tomography, Raman detection.
2) Constraining the array dimension has no specific military significance.

Recommendation: Revise the proposed rule to: "(7) Charge multiplication focal plane arrays ~~having greater than 1,600 elements in any dimension and having a maximum radiant sensitivity exceeding 50 mA/W for any wavelength exceeding 760 nm but not exceeding 900 nm, and avalanche detector elements therefor;~~ *specially designed for military use*;".

Comment 8 Section: XII(c)(8)

Issue: Encapsulated charge multiplication FPAs are dual-use devices commonly used in commercial applications.

Reasons:

1) The detectors are dual-use devices. Commercial applications include: enhanced underwater imaging, life science imaging applications (such as single molecule detection, live cell fluorescence microscopy, ion signaling and weak luminescence detection), photon counting, adaptive optics, single molecule detection, neutron tomography, Raman detection.
2) These are listed on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

Recommendation: Revise the proposed rule to: "(8) Charge multiplication focal plane arrays described in paragraph (c)(7) of this category in a permanent encapsulated sensor assembly, ~~and avalanche detector elements therefor;~~ *and specially designed for military use*;".

Comment 9 Section: XII(c)(9)

Issues: This section does not adequately capture only the IDCA-based IRFPA detectors that are designed for military use.

Reasons:

1) Some cooled IDCA-based IRFPA detectors that are specially designed for dual-use products would be captured by this rule. For example, those detectors that are designed for use in the following gas imaging cameras are designed exclusively for dual-use products and are inadvertently captured by this rule:
    a. IR Cameras Niatros (http://www.ircameras.com/camera/niatros-optical-gas-imager/)
    b. FLIR Gas FindIR (http://www.flir.com/ogi/display/?id=55671)
    c. Opgal Eye-C-Gas (http://www.opgal.com/portals/0/pdf/eyecgas_27.11.2012_small.pdf)
2) The following criteria are not related to the military use of this technology:
    a. cooling source temperatures below 218K
    b. mean-time-to-failure (MTTF) in excess of 3000 hours
    c. "active cold fingers" (Note: The term "active cold finger" is not common terminology and seems to be used only in export control papers. I believe that the meaning here is to

identify those cold fingers that are not passively cooled with liquid nitrogen or compressed gases. It may be better in the future to specific "non-passively cooled".)

3) Some cooled IDCA-based IRFPA detectors are listed on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

Recommendation: Revise the proposed rule to:

"(9) Integrated IRFPA dewar cooler assemblies (IDCAs), with or without an IRFPA, having any of the following:

(i) Variable or dual aperture mechanisms; or

(ii) Dewars specially designed for military use;"

<u>Comment 10</u> <u>Section: XII(c)(12)</u>

Issue: The listing of "Infrared imaging camera cores" in the title is confusing, is too broad in scope and includes terms that can be interpreted in different ways.

Reason:

1) This section includes more than just cores with infrared detectors. For example, the first option lists an image intensifier tube as a possible component, yet image intensifier tubes are not components of "Infrared imaging camera cores".
2) In order to prevent capturing many dual-use products, the title needs to be limited to constraint products specially designed for military use.
3) The title lists "electronics and optics" without being very specific about the nature of those items. For example, were they designed for military use only?

Recommendation: Revise the header for section (12) to: "(12) ~~Infrared i~~Imaging camera cores (*e.g.,* modules, engines, kits)~~, and specially designed~~ ~~electronics and optics~~ *specially designed for military use and* ~~,~~having any of the following:". Move optics, electronics and accessories to Xii(e).

<u>Comment 11</u> <u>Section: XII(c)(12)(i)</u>

Issue: This rule inadvertently captures dual-use intensified cameras that are designed for commercial applications such as scientific imaging.

Reasons:

1) The cameras are dual-use devices. The commercial applications for this intensified cameras include: fluorescence lifetime imaging microscopy, time-resolved imaging & spectroscopy, plasma diagnostics, combustion, planar laser induced fluorescence and particle imaging velocimetry.
2) Imposing military-level export controls on a dual-use camera is not justified simply because it contains an image intensifier tube.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Andor iStar 512T (http://www.andor.com/scientific-cameras/intensified-camera-series)
    b. Photonic Science (http://www.photonic-science.co.uk/products/intensified-ccd-cameras.html)
    c. LaVision Nanostar (http://www.lavision.de/en/products/cameras/iccd_cameras.php)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(i) An image intensifier tube ~~described in paragraph (c)(1) of this~~;".

Comment 12 Section: XII(c)(12)(ii)

Issue: The shock criteria listed are poorly defined and are not exclusive to military products. This rule inadvertently captures dual-use microbolometer cameras.

Reasons:

1) The definition for maximum shock is not sufficient to fully define the constraint. For example, what is meant by "Output imagery"? Can the image flicker? How much? How can the 325 g of force be applied? What is the permissible shock profile?
2) Many commercial applications require dual-use microbolometer cameras to sustain shock. For example, some are used in an industrial setting and must withstand a 6' drop from a ladder. In a firefighting application, the thermal imager is used by the firefighter in very harsh conditions.
3) Constraining a camera based on the fact that it withstands a briefly defined shock rating is not sufficient to justify military significance.
4) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

Recommendation: Remove the proposed rule XII(c)(12)(ii).

Comment 13 Section: XII(c)(12)(iii)

Issue: The number of detector elements is not a criteria that delineates dual-use and military use microbolometer IRFPAs.

Reasons:

1) There are dual-use cameras that are captured by this rule. Applications for dual-use cameras include: portable thermography, industrial and scientific R&D, predictive and preventive maintenance, building inspection.
2) Constraining the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Jenoptik IR-TCM-HD-1024 Thermography Camera Module (http://www.jenoptik.com/en-ir-tcm-hd-1024)
    b. Jenoptik VarioCAM HD Thermography Camera (http://www.jenoptik.com/en-variocam-high-definition-thermography-camera)
    c. Thermoteknix MicroCAM 1024 Thermal Imager (http://www.thermoteknix.com/products/oem-thermal-imaging/microcam-1024hd-thermal-imager/)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(iii) A microbolometer IRFPA;". If the products are limited to military use items only, no criteria limiting performance of the microbolometers used need to be stated.

Comment 14 Section: XII(c)(12)(iv)

Issue: This rule inadvertently captures some dual-use camera cores that use IDCAs.

Reasons:

1) There are dual-use cooled cameras that are captured by this rule. Applications for dual-use cooled cameras include: gas imaging, hyperspectral imaging, spectroscopy.
2) Constraining the camera simply because it uses a cryocooled IDCA has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Opgal Eye-C-Gas (http://www.opgal.com/portals/0/pdf/eyecgas_27.11.2012_small.pdf)
    b. Telops Hyper-Cam Methane (http://www.telops.com/en/hyperspectral-cameras/hyper-cam-methane)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(iv) An IDCA or IDCA parts or components described in paragraph (e)(7);". If the products are limited to military use items only, no criteria limiting performance of the IDCAs used need to be stated.

Comment 15 Section: XII(c)(12)(v)

Issue: This rule lists unencapsulated one-dimensional photon detector IRFPAs.

Reasons:

1) I'm not familiar with any product that uses an unencapsulated detector without first encapsulating it.

Recommendation: Seems like an unnecessary addition.

Comment 16 Section: XII(c)(12)(vi)

Issue: This rule lists unencapsulated two-dimensional photon detector IRFPAs.

Reasons:

1) I'm not familiar with any product that uses an unencapsulated detector without first encapsulating it.

Recommendation: Seems like an unnecessary addition.

Comment 17 Section: XII(c)(12)(vii)

Issue: This rule inadvertently captures some dual-use camera cores that use one-dimensional photon detector IRFPAs.

Reasons:

1) There are dual-use infrared linescan cameras that are captured by this rule. Applications for linescan cameras include: portable thermography, industrial and scientific R&D, predictive and preventive maintenance, building inspection. Here are some examples of dual-use cameras that are captured by the rule:
    a. Sensors Unlimited (http://www.sensorsinc.com/products/linescan-cameras/)
2) Constraining products based on the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Xenics Lynx-1024-CL (http://www.xenics.com/en/camera/lynx-1024-cl)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(vii) A one-dimensional photon detector IRFPA;". If the products are limited to military use items only, no criteria limiting performance need to be stated.

<u>Comment 18</u> <u>Section: XII(c)(12)(viii)</u>

Issue: This rule inadvertently captures some dual-use camera InGaAs cores that use two-dimensional photon detector IRFPAs.

Reasons:

1) There are dual-use infrared InGaAs cameras that are captured by this rule. Applications for dual-use InGaAs cameras include: spectroscopy, semiconductor inspection and DWDM optical performance monitoring. Here are some examples of dual-use cameras that are captured by the rule:
    a. Sensors Unlimited Mini SWIR (http://www.sensorsinc.com/products/detail/mini-swir-jsx-snapshot-camera-60-fps)
    b. FLIR Tau SWIR (http://www.flir.com/cores/display/?id=51890)
2) Constraining products based on the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.
4) There are foreign available dual-use products, for example:
    a. Xenics BobCat 640 (http://www.xenics.com/en/bobcat-640-gige)
    b. Raptor Owl 640 (http://www.raptorphotonics.com/product/owl-640-analog-33)
    c. SCD InGaAs 640 (http://www.scdusa-ir.com/ingaas/)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(viii) A two-dimensional photon detector IRFPA ~~described in paragraph (c)(2) or (4) of this category~~ having a peak response within the wavelength range exceeding 900 nm but not exceeding 2,500 nm~~, and greater than 111,000 detector elements~~;". If the products are limited to military use items only, no criteria limiting performance need to be stated.

<u>Comment 19</u> <u>Section: XII(c)(12)(ix)</u>

Issue: This rule inadvertently captures some dual-use camera cooled cores that use two-dimensional cooled IDCAs.

Reasons:

1) There are dual-use infrared research cameras and certain gas-imaging that are captured by this rule. Applications for infrared research cameras include: Non-destructive testing, high-speed imaging of dynamic events, gaseous cloud studies. Applications for gas-imaging cameras include: methane emissions monitoring, leak detection, pollution monitoring, flare measurement, standoff emission characterization of smokestacks. Here are some examples of dual-use cameras that are captured by the rule:
    a. FLIR GF300/320 Infrared Cameras (http://www.flir.com/ogi/display/?id=55671)
    b. Sofradir EC IRE-320M Camera (http://www.thermal-cameras.com/th-mwirs.html)
2) Constraining products based on the pixel count has no specific military significance.
3) As with other dual-use items, these items are controlled on the Wassenaar "Sensitive List of Dual-Use Goods and Technologies" and not on the Wassenaar "Munitions List". Listing dual-use items on the USML will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

4) There are foreign available dual-use products, for example:
   a. Xenics Onca-LWIR-MCT-384 (http://www.xenics.com/en/onca-lwir-mct-384)
   b. Telops TX-IR (http://www.telops.com/en/infrared-cameras/ts-ir-thermal-scientific-ir-camera)

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(ix) A two-dimensional photon detector IRFPA ~~described in paragraph (c)(4) of this category~~ having a peak response within the wavelength range exceeding 2,500 nm but not exceeding 30,000 nm;". If the products are limited to military use items only, no criteria limiting performance need to be stated.

Comment 20 Section: XII(c)(12)(xi)
Issue: The term "IRFPA" should be excluded from this description.
Reasons: The FPAs mentioned in XII(c)(7) and XII(c)(8) are not IRFPAs.
Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "A charge multiplication FPA controlled in paragraph (c)(7) or (c)(8) of this category".

Comment 21 Section: XII(c)(13)(ii)
Issue: This rule inadvertently controls firefighting cameras and thermography cameras.
Reasons:
Recommendation:

Comment 22 Section: XII(c)(14)(iii)
Issue: This rule captures large format perimeter security cameras and their optics which are dual-use articles.
Reasons:
   a. Large format cameras are often used to monitor wide areas and so controlling them here is ineffective.
   b. In addition, multiple cameras would accomplish the same function as one high definition camera.

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(iii) Fixed-site reconnaissance, surveillance or perimeter security systems or equipment *specially designed for military use* ~~having greater than 640 detector elements in any dimension~~;".

Comment 23 Section: XII(c)(14)(iv)
Issue: This rule captures large format perimeter security cameras with zoom optics which are dual-use articles.
Reasons:
   a. Large format cameras are often used to monitor wide areas and so controlling them here is ineffective.
   b. In addition, multiple cameras would accomplish the same function as one high definition camera.

Recommendation: Revise the header of section (12) to consider only products "specially designed for military use" and revise the proposed rule to: "(iv) Combat vehicle, tactical wheeled vehicle, naval vessel, or aircraft pilotage systems or equipment *specially designed for military use and* having a variable field of view or field of regard (*e.g.,* electronic pan or tilt), and either an IRFPA article controlled in this subchapter with greater than 640 detector elements in any dimension, or an IIT controlled in this category (*e.g.,* DAS, DVE, SeaFLIR, PNVS);".

Comment 24 Section: XII(c)(16)

Issue: Seeks to control as ITAR any optics that are designed for high definition infrared cameras [section XII(c)(16)(iii)] and high definition infrared cameras with zoom lenses [section XII(c)(16)(iv)].

Reasons: Infrared optics are normally designed for diverse commercial applications. Optics designed for military use normally have additional requirements. It is inadvisable to control all these infrared optics on the USML if they are designed for less stringent commercial applications.

Recommendation: Control only those infrared optics that were designed for military use.

Comment 25 Section: XII(c)(18)

Issue: Seems that these near-to-eye display are accessory items adequately covered in XII(e)(12).

Reasons:

Recommendation: Remove this rule.

Comment 26 Section: XII(c) Note 1 to paragraph (c)

Issue: Though unrealistic, the requirement “A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) prevents … without destruction or damage to the IRFPA” is one that, with enough expense and motivation, may be able to be overcome. As such, the distinction between an unencapsulated and encapsulated sensor assembly may be irrelevant even though impractical. If the motivation to control unencapsulated IRFPAs is to more easily control the technology behind the IRFPA, it seems unnecessary to have such a demanding constraint. In addition, this constraint does not exist for dual-use non-US IRFPAs, so why should US manufacturers be encumbered with the cost and development of tamper resistant methods when we have agreed that our Wassenaar partners do not have the same requirement?

Recommendation: Remove Note 1 to paragraph (c).

Comment 27 Section: XII(c) Note 2 to paragraph (c)

Issue:

1) This note does not create a “bright line” between circumstances that meet the requirement and those that do not.
2) The parameter “having greater than 640 detector elements in any dimension” is not exclusive to military use.
3) Image intensifiers do not necessarily have “pixels”, so including (c)(1) is incorrect.
4) The requirement that the items “… cannot be removed without destruction or damage to the article or render the item inoperable” does not define “damage” or “inoperable”. For example, if the article’s paint is scratched, is it damaged? If so, then it’s a trivial requirement.
5) Why is there a constraint on removal of the item when most of these IRFPAs are available from foreign sources?
6) It is not practical to have such a requirement for products sold commercially as service and repair will be very costly. Implementing in accordance with this rule will make US companies uncompetitive and will encourage using non-US devices by foreign end-customers.
7) It may be possible but impractical to remove the item without destruction or damage.
8) These constraints are not placed on items listed on the Wassenaar Dual-Use List and consequently result in unilateral control of US-made devices which is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

Recommendation: Dual-use end products need to be controlled as dual-use. However, distribution of articles that contain munitions items need to be export controlled and acceptance should demand certain evaluation of the end-customer and security of the article. Remove Note 2 to paragraph (c).

Comment 28 Section: XII(e)(7)

Issue: "Cryocoolers having a cooling source temperature below 218K and a mean-time-to-failure (MTTF) in excess of 3000 hours" pertains to dual-use items and should not be controlled in this section unless they are specially designed for military use.

Reasons: Foreign availability for cryocoolers used in various civil applications. For example:

1) Ricor K508 (MTTF 10,000 hours): http://www.ricor.com/products/integral-rotary/k508/

Recommendation: Use specially designed for military use to capture any uniquely military cryocoolers.

Comment 29 Section: XII(e)(9)

Issue: "Infrared lenses, mirrors, …" are normally dual-use items and should not be controlled in this section unless they are specially designed for military use.

Reasons: Foreign availability of IR optics within and outside of Wassenaar

1) Z&Z Optic, China: http://www.zzoptic.com/
2) Ophir Optics, Israel: http://www.ophiropt.com/
3) Wavelength Tech, Singapore: http://www.wavelength-tech.com/

Recommendation: Use specially designed for military use to capture any uniquely military optics and remove from the companion rule references to 6A615 which impose unilateral controls on US suppliers.

Comment 30 Section: XII(e)(11)(ii)

Issue: Fusion is useful in dual-use articles. Check that items are not controlled in this section unless they are specially designed for military use. Also, be more specific about which sensors are being fused (e.g. visible and IR)?

Reasons: Foreign availability of fusion algorithms and systems. For example:

1) Xenics, http://www.xenics.com/en/meerkat-fusion

Recommendation: Use specially designed for military use to capture any uniquely military algorithm or electronics fusion approaches. The statement "to improve classification, identification, or tracking of targets relative to any of the individual sensors is too broad.

Section 2: Detailed Comments to Amendment to the EAR, Revisions resulting from Category XII changes

http://www.regulations.gov/#!documentDetail;D=BIS-2015-0016-0001

Comment 1 Section: 740.16 Availability of License Exemption APR

Issue: Cameras described in ECCN 6A003 may only be exported or re-exported under License Exception APR if they have no more than 111,000 elements (among other factors). It makes no sense to inflict the limitation on the number of elements when the articles are embedded in civil products.

Reasons:

1) Such a constraint could adversely impact civil applications that require additional array size.
2) Multiple lower resolution cameras positioned together could achieve the same performance. Consequently, the limitation has no real performance impact.
3) These items are controlled freely on the Wassenaar Dual-Use List. Encumbering US products will result in unilateral control of US-made devices and is not consistent with the intent of the Wassenaar Agreement for export controlled devices.

Recommendation: Remove the pixel count constraint entirely.

Comment 2 Section: 744.0 Revision to require a license for 9 Hz cameras

Issue: Apparently 744.9 is to be revised to require a license for 9 Hz cameras if exported to a "military end user" or if incorporated into a "military commodity".

Reasons: If the article wasn't designed specifically for military use, then this seems to establish a control requirement that is inappropriate. While the article may have military applicability, because of significant commercial use, the item is essentially commoditized. Encumbering US manufacturers would impose restrictions that are neither fair nor are easily managed.

Recommendation: Maintain the sanctity of <9Hz camera cores.

Comment 3 Section: ECCN 6A615c

Issue: The section ECCN 6A615c seeks to control "certain zinc selenide, zinc sulfide, germanium, or chalcogenide optics blanks." Though it's not clear, it seems likely (and should be clarified) that this rule also controls the lenses that are made from the blanks. This is absurd as many of the infrared lenses are designed for non-military applications.

Reasons: Encumbering US lens manufacturers with these export controls will undermine their participation in US markets. Significant foreign availability exists for infrared lenses outside the US (including Israel, Germany, China, The Netherlands and Japan) and would certainly fulfil the market need.

Recommendation: Control only those lenses that were designed for military use or use materials (such as AMTIR4) that may only be used in military applications.

Comment 4 Section: ECCN 6A615g

Issue: The section ECCN 6A615g section g captures IR zoom lenses used on cooled cameras ("…equipment incorporating a variable field of view or field of regard, and incorporating a photon detector-based infrared focal plane array having less than 640 elements"). Many infrared lenses are designed for non-military applications.

Reasons: Encumbering US lens manufacturers with the same export controls for both military and commercial products when significant foreign availability exists is not appropriate.

Recommendation: Control only those lenses that were designed for military use or use materials (such as AMTIR4) that may only be used in military applications.

FRASER OPTICS®
The Clear Advantage

Subject: Fraser Optics Response to Category XII Proposed Changes

1. Switching from Figure of Merit (FOM) to "luminous sensitivity" as *the* discriminating factor is seen as an arbitrary and confusing value versus the current method (signal-to-noise ratio x resolution).What is the comparison of luminous sensitivity to established FOM levels so we can assess the impacts. Fraser is intimately involved with providing IITs thru export licensing and this change could rewrite all the licensing precedents established up to now for years of exporting internationally.
    a. Why the change at all. IITs are 30 year old technology and are available all over the world. This will make it harder to sell our systems outfitted with IITs internationally by changing from FOM to this unknown value and give openings to cut into our sales with tubes more easily available with less hassles and controls. We open the door for European companies and others like Photonis, 4 Russian manufacturers and a German company. We already see sales internationally turning from US manufactured IITs to European due to export controls and fluidity of approvals by the US.
    b. Microamps per lumen
        i. How does this transfer to FOM levels as currently used
        ii. Why the change?
        iii. What is the purpose - harden the controls on old technology
    c. Is auto-gating a part of the licensing process still, or are there levels of auto-gating?

2. Why should 9 Hz Thermal imaging cameras already cleared for commercial use by Commodity Jurisdictions be subject to export-control regardless of their integration into foreign equipment? This is counter-productive to the stated goal of US products being included in foreign design and ultimately detrimental to U.S exports.
    a. 9 Hz thermal imaging cameras are available globally and can replace US manufactured devices tied up in added controls and licensing not there previously. Any effect on acquisition by foreign countries will be minimal at best and ensure that U.S companies are written out of foreign military designs
        i. EU Annex I List of Dual Use Items and Technology (6A003.b.4.b)
    b. At our company, one that employs less than 35 people, this could seriously hamper our ability to close millions of dollars worth of sales with this attempt to keep 20 year old technology out of the hands of the wrong people but instead negatively impact the sales and growth of US companies thru export and Commodity Jurisdiction sales currently underway or in business plans for 2016 and out.
3. What capabilities of a thermal sensor array are changed when it is taken out of its "encapsulated sensor assembly?" Whether it is a permanent assembly or not has no affect on the capabilities of the imager.
4. What does the category encapsulated sensor Assembly for a thermal imager mean, what is the purpose of this description???
    a. Applying software to change the capabilities is completely different and already covered.
    b. The logic of this proposal is: (non-ITAR product)+(non-ITAR product) = ITAR product
    c. This is exactly the kind of change that will stifle exports while offering nothing in the way of protecting US technologies, forces, or security interests.
5. If a product is already designated non-ITAR, then why is it assumed:
    a. That restricting its sale is making any measurable impact on foreign forces ability to acquire it?
    b. That restricting its sale is good for the US and for US companies
    c. How are US companies expected to operate in this severely limited environment???

FRASER OPTICS®
The Clear Advantage

d. That other countries aren't taking advantage of this and pushing their technology and products into areas where US companies dominate?
e. That we aren't *already* being excluded from foreign innovation, design, and exports?
f. That we won't miss out on incorporating new technologies to improve our own?
g. That billions of dollars won't be lost in exports every year?
h. That this won't cost thousands of jobs?

Mr. C. Edward Peartree
Director
Office of Defense Trade Controls Policy
Department of State
2401 E Street NW, SA-1, Room H1200
Washington, D.C. 20037

RE: Request for Comments Regarding Review of Categories VIII and XIX (80 FR 11314, dated March 2, 2015)

Dear Mr. Peartree:

On behalf of Garmin International, Inc. ("Garmin"), we are pleased to provide these comments responding to the Request for Comments Regarding Review of U.S. Munitions List ("USML") Categories VIII and XIX, administered by the Directorate of Defense Trade Controls ("DDTC").

Garmin believes that Category VIII(e) has operated well. We believe that Category XII should not be amended to provide an enumerated clause that describes gyros, AHRS, or INS that operate at defined performance parameters. The catch and release provisions for gyroscopes, AHRS, and INS better achieve the goals of Export Controls Reform to exclude from the USML items in normal commercial use over time.

Catch and Release Provisions of VIII(e)

We appreciate the strategy of DDTC periodically to review Category VIII, and Garmin understands the general preference of DDTC and the Administration to use enumerated performance criteria where possible. However, there are reasons this policy-making strategy is not the better alternative when compared to the catch and release provisions of Category VIII(e). In anticipation of publication of a revised Category XII, Garmin is gathering information regarding common commercial use of gyroscopes, AHRS, and INS equipment and will comment further on Category XII when it is published.

Recommendation

Garmin believes AHRS, INS, and gyros should remain subject only to a catch-all clause under the USML. Category XII should not be amended to provide an enumerated clause that describes gyroscopes, AHRS, or INS that operate at defined performance parameters. The catch and release provisions better achieve the goals of Export Controls Reform to exclude from the USML items in normal commercial use over time. Commercial avionics has and will continue to evolve quickly to improve safety and efficiency of commercial flight.

Sincerely,

John Preis
Manager, International Trade Compliance

General Comment

I am Gary Strahan CEO of "ICI Infrared Cameras Inc. I am an Honorably Discharged Navy Veteran, Father, Grandfather and small business owner.This 125 Page Confusing Dissertation will honestly likely be the End of my company which has been in business for 20 years. This ITAR change proposal will hinder my companies growth and Export capability. We are growing and currently hiring people here in the U.S.A and creating Jobs here in the U.S.A and I will likely have to hire a $500 per hour attorney if this proposal becomes law just to make sure I stay out of jail before I ship a system outside the U.S.. " For Example" Things are bad enough now as a company in Mexico or South America can buy an excellent 640 x 480 camera from China that operates at 30 Hz or 60 Hz and sell it a few hundred miles form my home with NO ISSUE while I am relegated to selling a 9 Hz camera. This is ridiculous!This 125 pages will discourage us from growing and exporting. Why is this necessary given the foreign availability and how US companies purchase and rebrand/label products using foreign (i.e. PRC, French) fpas. If these foreign cameras/fpas are that bad, why does the US military use French cameras/fpas in the US KC-46 refueling tanker, clip-ons, IRST programs. No ITAR issues for the PRC, EU, etc. So should anything uncooled be on the ITAR unless it meets specific military parameters which are not found in the rewrite. Why doesn't our Government just make all Uncooled sensors Commerce? I will be speaking to whoever will listen in Congress and including the Governors in all of the states I currently do business in Including Texas, Michigan, and Minnesota and Lord knows Michigan needs all the help it can get . The U.S. Needs all the jobs it can get and this proposal does nothing but hinder it.This USML rule is Poor and should be thrown out. Start over Please!!! The foreign availability of these systems is

everywhere I have uploaded brochures that meet the "performance" metrics in Cat 12. Does PRC make cores that withstand 325g at .43 mS shock ? Is that even a good metric or can it result in a unlevel playing field for US exporters (some say they meet it, some say they don't) ? The definition of a Core or hermetically sealed FPA is Not even defined in this document. Do we even know what a core is ? You may think you do but does industry agree with you or is this just another situation where you will call me and ask how Company X is selling their "camera" while you can't ? What is permanently encapsulated mean ? Will this result in more CJ submissions ? Is this a bright line or worse ? It is absolutely more WORSE and will likely put ICI out of business so even more US jobs gone to Foreign Competition! Should the entire effort be ditched in favor of something more simple and enforceable - YES!!! perhaps the Wassenaar Munitions List or simply just changing the word in the existing Cat 12 from "specifically" designed to "specially" designed ? Help Please my company. Many who see this document will not even comment as it is 125 pages and more than any reasonable working man has time to read. Please make it Simple and Help small U.S. Businesses like mine grow and create jobs. I love this country and when bad guys try and get systems I report them. I report them. I guess the Government just wants me to denounce my U.S. Citizenship move out of MY Country and start selling Chinese cameras. Please stop this madness and help small companies like mine grow and prosper. We use these sensors to make Medical Devices to help save lives. Inspect Electrical and Mechanical systems to help prevent explosions. help Firefighters see through h smoke.
Please cut the red tape and really consider what you are doing to small companies like mine. Thank you Gary E. Strahan CEO Infrared Cameras Inc. "ICI"

Please visit Dali Infrared, Wuhan Guide, SAT Infrared and really find out what is available. Please help ease these export regulations so we at least have a chance to compete

USML Export Control Form Category VII

If the new is passed it will crush my company, again. Is our Government and DOD really trying to help my company?

I have been watching Foreign Infrared Sensor and Camera manufacturers that did not exist 5-20 years ago grow and triple and quadruple in size. Companies around the world grow and expand and yet we still have our hands tied. Companies like Flir who I used to work for just buy foreign companies and circumvent our government tying their hands. Flir is in fact the largest purchaser of Ulis(French) Sensors in the world. Ulis business has Exploded over the last 10 years because our governments export restrictions. Flir has deep pockets and was able to buy Cedip in France in order to circumvent U.S. Export Law. We do not that capability. Here are a few of these companies who now manufacture sensors and cameras that are growing and some did not even exist 10 years ago.

http://redirect.state.sbu/?url=http://www.gwic.com.cn/en_corpIntro.html
http://redirect.state.sbu/?url=http://www.dali-tech.us/
http://redirect.state.sbu/?url=http://www.ulis-ir.com/
http://redirect.state.sbu/?url=http://www.satir-uk.com/
http://redirect.state.sbu/?url=http://www.wuhan-guide.com/en/

20 years ago most of these companies were not even around. If we had not restricted sensor and camera sales I will bet my company would be at least 5 times the size that it is now

What does that mean. **It means JOBS for U. S. Citizens**. It means we have even more leadership in the world market. **It means health for our country and a better Tax Base.**

Do our Senators, Congressman, Governors, or Representatives really care. The reality is they do not really understand the technology or the potential of the technology. It is like they have the Inventors of the Computer or Smart Phone or Digital camera in front of them and they do not even realize it. I am an Honorably Discharged Veteran and I do not believe the U.S.DOD cares if my business survives or fails. We will likely watch what happened to the Satellite Industry happen to the Infrared Industry. We used to own the night and 95% of the market and now we are at 50% if things do not open up and change in the next 5 years I will bet we go to 20%

Subject:	ITAR Amendment Category VII
Date:	Thursday, May 28, 2015 5:40:15 PM
Attachments:	image002.png

To whom it may concern,

I care and this amendment impacts ICI and all of its employees. This Proposal was supposed to make things easier and it really is headed in the wrong direction. It needs to be simple and fundamentally rewritten. We believe "Specially Designed" should be fully applied to this Category as opposed to Performance Parameters. We all believe the USML should align with the Wassenaar Arrangement Munitions list.

We all know the DOD does not want to discuss "Foreign Availability" but it is a Reality. A reality that is allowing Foreign Suppliers to Expand and grow while many U.S. Commercial companies have shrunk, gone bankrupt, or out of business. We are trying to grow and create jobs here in the U.S. but frankly we are being regulated and taxed to death. Please take a look at the links below. These guys are making some excellent sensors. We need to be creating U.S. jobs and helping U.S. companies. The fact is I cannot ship a 30 Hz 640 x 480 camera to Mexico Ford Motor Company 300 miles from my home but Dali in China can overnight them one. I sincerely believe if we do not do something about this ICI will be out of business. Help!

GAS IMAGING TECHNOLOGY, LLC
Wholly owned subsidiary of **Pacific Advanced Technology**

June 17, 2015

U.S. Department of State
Directorate of Defense Trade Controls
Compliance & Registration Division
2401 E Street NW, SA-1, Room H1200
Washington, DC 20522-0112

To Whom It May Concern
This letter is in response to the request for public comments to the modifications to Category XII as directed by Executive Order 13563.

Background

Pacific Advanced Technology is a small business, women owned, located in the county of Santa Barbara in the state of California. We develop, manufacture and sell worldwide infrared cameras for specialty application that services the oil, gas, petrochemical, chemical, manufacturing and power industries.

Reading the intent of Executive Order 13563 which was to emphasize the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility we feel that there are some serious issues that need to be addressed that do not accomplish this.

Executive Order 13563 as we understand it had an objective to move some items that the President has determined no longer merit control under the ITAR to control under the CCL. We believe that the language as written to revised category XII will in many cases control technology that doesn't have specific military or intelligence applications or in some cases is definitely covered by the Wassenaar Arrangement on Export Control for Dual-Use Goods and Technologies or is currently covered by the CCL and move it to ITAR. It has increased complexity, caused redundancy in the ITAR and CCL, and has increased confusion with broad and sweeping regulation without definition and specificity. It catches many commercial technologies and foreign availability into ITAR control which severely reduces the ability of American companies to compete in the worldwide market.

Specific examples of our concerns and where category XII as written will severely affect our business are given below. Because of this we believe that category XII as written should not and cannot be let to stand and needs significant rewriting.

Specific Areas of Concern

Photon Detectors (not encapsulated)

*c) (2). Photon detector, microbolometer detector, or **multispectral detector** infrared focal plane arrays (IRFPAs) having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm and not integrated into a permanent encapsulated sensor assembly, and detector elements*

Our Concern - What is the definition of multispectral detector infrared focal plane arrays. *(Multispectral refers to producing discrete outputs associated with more than one spectral band of response.)*

This is too broad and should be defined to avoid confusion. Example, in the open literature multispectral sometimes refers to detection in different spectral regions such as mid-wave infrared between 3 to 5 microns and longwave infrared between 8 to 12 microns. In other open literature multispectral refers to the detection of sub spectral regions with in the broad mid-wave or long wave region. Example multispectral are bands that are 0.1 micron wide within the spectral region of 3 to 5 microns.

Also it is not clear what discrete outputs associated with more than one spectral band of response mean? Not clear and can be interpreted in many different ways.

This section needs to be rewritten to more clearly define what multispectral means.

Cooled Encapsulated

(4). Two-dimensional photon detector IRFPAs described in paragraph (c)(2) in a permanent encapsulated sensor assembly, having greater than 256 detector elements;

Our Concern - This description is unclear and inconsistent. First it states Two-dimensional photon detectors ……… having greater than 256 detector elements. Does this refer to cooled encapsulated IRFPA's that are greater than 32 x 32 pixel arrays? If this is the case this is way too restrictive and capturing IRFPAs in our current cameras that are exported under CCL 6A003 and certainly does not harmonize with the Wassenaar Arrangement as well as foreign availability of cooled encapsulated IRFPA as large as 640 x 512 detector arrays or (327,680 detector elements).

Example of foreign availability:
http://www.xenics.com/en/onca-mwir-insb A Belgium company that has a 640 x 512 (327,680) cooled InSb Photon detector camera that is a commercial product. InSb photon detector have a peak response between 2,500 nm and 5,000 nm.

1607 Mission Dr., Suite 301
Solvang, CA 93463
USA
1 (805) 688-2088, (805) 693-4012
micheleh@gitint.com
www.gitint.com

http://www.electrophysics.com/DbImages/SofEC-ScorpioMW-v11.pdf A French company that has a 640 x 512 (327,680) cooled Photon Detetor core and cameras that are commercial product using HgCdTe photon detector having a peck response between 2,500 nm and 11,000 nm.

http://johotek01.en.made-in-china.com/product/cbMnfdpVnwRk/China-Long-Range-Surveillance-Mwir-Cooled-Infrared-Thermal-Camera-with-600-137-22mm.html A Chinese company that has cooled HgCdTe photon detector cameras with 320 x 256 and 640 x 512 pixel elements as commercial products.

This section needs to be rewritten to more clearly define detector element size in a two-dimensional IRFPA to be harmonized with the Wassenaar Arrangement Dual-Use List and described in Category 6 of the CCL, and to take into foreign availability when determining the number of detector elements in a two-dimensional IRFPA.

Multispectral

c) (6) Multispectral IRFPAs in a permanent encapsulated sensor assembly, having a peak response in any spectral band within the wavelength range exceeding 1,500 nm but not exceeding 30,000 nm;

Our Concern - Again this has the same concern as addressed above in c) 2 for the same reasons. There needs to be a more detailed definition of multispectral.

This is too broad and should be defined to avoid confusion. Example, in the open literature multispectral sometimes refers to detection in different spectral regions such as mid-wave infrared between 3 to 5 microns and longwave infrared between 8 to 12 microns. In other open literature multispectral refers to the detection of sub spectral regions with in the broad mid-wave or long wave region. Example multispectral are bands that are 0.1 micron wide within the spectral region of 3 to 5 microns.

Also it is not clear what discrete outputs associated with more than one spectral band of response mean? Not clear and can be interpreted in many different ways.

We recommend a rewrite of c) 6 with a better description of what is meant by multispectral.

DDCA's

c) (9) Integrated IRFPA dewar cooler assemblies (IDCAs), with or without an IRFPA, having any of the following:
Cryocoolers having a cooling source temperature below 218 K and a mean-time-to-failure (MTTF) in excess of 3000 hours;

Our Concern -This is way too restrictive and puts US manufactures at a competitive disadvantage. There are cryocoolers that are sold on the open market in countries other than the US. It also affects OEM's that need to use Cryocoolers in their commercial products with the added cost and restrictions of the ITAR regulation.

Example of foreign availability can be found at http://www.ricor.com/about-us/directions-page/ Ricor is a company in Israel who makes cryocoolers, of their basic model is the K508 and it cools to 77K with a MTTF of 10,000 hours. This is a commercial product.

This specification on cryocoolers needs to be rewritten with the understanding that commercial products are available in the foreign market with much more capability than Cat XII is try to control.

(i) Active cold fingers;

Our Concern - This is way too broad and needs to be defined as what an active cold finger is. All cold fingers in cryocoolers are active in the sense that they change operation to maintain a temperature in the range needed by whatever they are cooling.

This section needs to be rewritten to more clearly define what an active cold finger is.

(ii) Dewars specially designed for articles controlled in paragraphs (a), (b), or (c) of this category;

Our Concern - This is way too broad and should take into account that there are many commercial applications that have Dewars specially designed for articles controlled in paragraph (a), (b), or (c) that currently are controlled with export licenses from the Commerce Department.
This regulation should say "specially designed for Military applications".

The paragraph needs to be rewritten so that it doesn't conflict with articles covered on the CCL.

Camera Cores

c) (12) Infrared imaging camera cores (e.g., modules, engines, kits), and specially designed electronics and optics therefor, having any of the following:

- A two-dimensional photon detector IRFPA described in paragraph (c)(4) having a peak response within the wavelength range exceeding 2,500 nm but not exceeding 30,000 nm;

Our Concern - As stated in comments to section c) (4) this regulation does not take into account the foreign availability of products that meet or exceed these specification. Restricting American manufactures will significantly hinder their ability to compete in the worldwide commercial market for applications using camera cores with this restriction.

It particularly hinders our ability to manufacture gas imaging cameras where a key element is the Camera Core as described in this section. Restrictions like this will force companies like ours to form foreign corporations to manufacture products in order to compete in an ever growing international market.

Example of foreign availability:
http://www.xenics.com/en/onca-mwir-insb A Belgium company that has a 640 x 512 (327,680) cooled InSb Photon detector camera that is a commercial product. InSb photon detector have a peak response between 2,500 nm and 5,000 nm.
http://www.electrophysics.com/DbImages/SofEC-ScorpioMW-v11.pdf A French company that has a 640 x 512 (327,680) cooled Photon Detector core and cameras that are commercial product using HgCdTe photon detector having a peck response between 2,500 nm and 11,000 nm.

http://johotek01.en.made-in-china.com/product/cbMnfdpVnwRk/China-Long-Range-Surveillance-Mwir-Cooled-Infrared-Thermal-Camera-with-600-137-22mm.html A Chinese company that has cooled HgCdTe photon detector cameras with 320 x 256 and 640 x 512 pixel elements as commercial products.

This section needs to be rewritten to more clearly define detector element size in a two-dimensional IRFPA to be harmonized with the Wassenaar Arrangement Dual-Use List and described in Category 6 of the CCL, and to take into foreign availability when determining the number of detector elements in a two-dimensional IRFPA.

- A multispectral infrared focal plane array described in paragraph (c)(2) or (c)(6);

Again the definition of multispectral

Our Concern - Again this has the same concern as addressed above in c) 2 for the same reasons. There needs to be a more detailed definition of multispectral.

This paragraph needs to be rewritten with a more defined definition of multispectral that is strictly needed for defense products and does not try to control those technologies and products that fall under "Dual Use" or are already covered by products currently sold with a commerce jurisdiction and controlled under 6A003.

Note to paragraph (c)(12): The articles controlled by this paragraph have sufficient electronics to enable as a minimum the output of an analog or digital signal once power is applied.

Our Concern - Again this language is controlling items that are on the Wassennar Dual Use list and/or controlled by the CCL. This needs to be rewritten to more clearly define sufficient electronics to enable as a minimum the output of an analog or digital signal once power is applied is way to broad and

1607 Mission Dr., Suite 301
Solvang, CA 93463
USA

1 (805) 688-2088, (805) 693-4012
micheleh@gitint.com
www.gitint.com

captures many commercial products and applications. It should be written with language that says is specifically design for military applications.

c) (16) Infrared imaging systems or equipment (e.g., fully packaged cameras) incorporating or specially designed to incorporate an article controlled in this category, as follows, and specially designed electronics, optics, and displays therefor:
- Having two or more axes of active stabilization and a minimum root-mean-square (RMS) stabilization better (less) than 200 microradians;

Our Concern - The way that this is broadly written will capture our CJ products that are currently being controlled by the CCL 6A003 when they are used with commercial stabilization platforms. We use our product for airborne gas leak imaging when flying pipelines not only in the US but worldwide.

With a specification of 200 microradians stabilization and no mention of how this is necessary for defense applications that need ITAR control when commercial stabilization platforms that can meet this specification are readily available.

This clause needs to be rewritten to add the language “that is specifically designed for military applications”. If this is not done the ITAR control of stabilization image platforms which are currently commercially available will severely limit US companies to compete in the international market and add cost and restriction to the US commercial market.

- Fixed-site reconnaissance, surveillance or perimeter security systems or equipment having greater than 640 detector elements in any dimension;

Our Concern - This language captures systems that are covered under the Wassenare Dual Use and are have foreign availability. We have products that are used for fixed-site surveillance in oil, gas, chemical and manufacturing facilities looking for gas leaks. These cameras were specifically design for commercial applications. In some instances they need to have more than 640 elements in any direction to be able to cover the necessary field of regard that our customers need.

This paragraph needs to be rewritten calling out “design for military applications” to insure that it doesn’t conflict with products that are already in the commercial market.

- Combat vehicle, tactical wheeled vehicle, naval vessel, or aircraft pilotage systems or equipment having a variable field of view or field of regard (e.g., electronic pan or tilt), and either an IRFPA article controlled in this subchapter with greater than 640 detector elements in any dimension.

1607 Mission Dr., Suite 301
Solvang, CA 93463
USA

1 (805) 688-2088, (805) 693-4012
micheleh@gitint.com
www.gitint.com

Our Concern - As mentioned in the previous paragraph the way this is written is going to capture our commercial products that are flown on airborne platforms to survey and area for gas leaks where buried and above group gas pipes exist worldwide.

This paragraph needs to be rewritten calling out "design for military applications" to insure that it doesn't conflict with products that are already in the commercial market.

- Multispectral imaging systems or equipment that either incorporate a multispectral IRFPA described in paragraph (c)(2) or (c)(6), or classify or identify military or intelligence targets or characteristics;

Our Concern -This should be rewritten change "or" to "and" so that it doesn't capture commercial products like ours that are being used for gas leak imaging. Also a definition of intelligence targets needs to be spelled out so that it doesn't leave room for interpretation.

c) (19) Systems or equipment that project radiometrically calibrated scenes directly into the entrance aperture of an electro-optical or infrared (EO/IR) sensor controlled in this subchapter within either the spectral band exceeding 10 nm but not exceeding 400 nm, or the spectral band exceeding 900 nm but not exceeding 30,000 nm; or

Our Concern - There is no definition of radiometrially calibrated and the way this is written it can capture any number of commercial product that perform thermographic image analysis and display the temperature of the scene in the view finder of the camera. We are particularly concerned because we display information on the concentration and type of gases that are observed leaking in the view finder for strictly commercial applications. These products are currently covered by the CCL 6A003. This language will pull them back to ITAR and make it very difficult to operate our business and compete in the worldwide market.

This paragraph needs to be rewritten calling out what is meant by "*radiometrically calibrated*" taking into account what makes it designed for defense applications and not commercial applications.

c) (20) Developmental imaging systems or equipment funded by the Department of Defense.
Note 1 to paragraph (c)(20): This paragraph does not control imaging systems or equipment (a) in production; (b) determined to be subject to the EAR via a commodity jurisdiction determination (see §120.4 of this subchapter), or (c) identified in the relevant Department of Defense contract or other funding authorization as being developed for both civil and military applications.

Our Concern - This note helps mitigate some of our concerns, however as we perform product improvement for our commercial items and we need to have a review to determine that our improvement are subject to the EAR via commodity jurisdiction we are seriously concerned that the language in the modification to Category XII in many of the paragraphs in c) (4) through c) (19) will not allow for a commodity jurisdiction. It is important that we have forward thinkers writing these rules and regulations that understand the technology and products that need to compete in the international market must not be hampered by antiquated, poorly written, and too restrictive language as is the case for so much of section c)

Our recommendation is that section c) needs a serious rewrite as stated above.

(e)(10) is added for specially designed drive, control, signal or image processing electronics.

Our Concern – this is unclear and overly broad. Virtually any IR camera that uses an IRFPA will have some portion of its electronics that "drive," "control" and/or "image process" data from the IRFPA. At least some portion of the IR camera electronics is always unique (specially designed?) for interfacing to a particular IRFPA. Thus, as written this will control at least some portion of the electronics of any IR camera that uses an IRFPA controlled in this category.

To achieve EAR control of a civil/commercial IR camera, a manufacturer would need to identify exactly which portion of the camera electronics is specially designed for the IRFPA (which is not at all clear), and then make that portion tamper proof according to the Note to paragraph (e), how to make something *sufficiently tamper proof* is not at all clear either.

Worse still we would also need to determine whether the electronics that "drive," "control" and/or "image process" data from the IRFPA is specially designed for the IRFPA die controlled in (c)(2) or the packaged/encapsulated IRFPA controlled elsewhere in (c); e.g., in (c)(5).

If anything, the electronics really has little to do with the packaging and is more logically associated with the IRFPA die controlled in (c)(2). Since (c)(2) controls practically every IRFPA the end result of the way this paragraph is written would put all our commercial products as ITAR controlled item.

Our recommendation is that (e) 10 is rewritten to say "specially designed for military applications".

Best Regards,

____

Office of Defense Trade Controls Policy
Department of State
Washington, DC
By email to DDTCPublicComments@state.gov

RE: ITAR Amendment—Category XII (RIN 1400-AD32)

Dear Madam/Sir,

I am writing on behalf of the Georgia Tech Research Corporation and the Georgia Tech Applied Research Corporation (collectively Georgia Tech), non-profit supporting organizations of Georgia Institute of Technology, to provide the following comments in response to the Department of State's Proposed Rule for *Amendment to the International Traffic in Arms Regulations: Revision to U.S. Munitions List Category XII - RIN 1400-AD32*. The Georgia Tech Research Corporation and Georgia Tech Applied Research Corporation serve as the contracting entities for Georgia Institute of Technology, one of the teaching and research institutions operated and managed by the Georgia Board of Regents of the University System of Georgia. The Institute is organized in six academic colleges plus the Georgia Tech Research Institute which was established by the Georgia General Assembly as a department within the Institute. With research expenditures totaling over $730 million, about 40% of Georgia Tech's funding for externally sponsored research is awarded by agencies of the United States Department of Defense (DOD), about 14% is funded by the National Science Foundation, and 14% by private industry while the balance comes from a number of federal and non-federal sponsors and private foundations.

With a significant DOD research portfolio at Georgia Tech is sensitive to the economic and technological value of some of the technologies described within the proposed Category XII. Our research portfolio includes many dual-use technologies within proposed Category XII including astronomy and space science, environmental, meteorological and oceanographic monitoring, telecommunication, photonics, computer processor-memory interconnects, materials engineering, thermal management, energy storage, energy conversion, photovoltaic devices, groundwater management, computational sciences, imaging and molecular medical diagnostic tools. Given their diverse technical specifications, variety of sponsor requirements, and the federal laws that apply, it is important that technologies subject to ITAR be specifically described with clear delineations between items that have military uses and those that have non-military commercial end uses.

We recommend that the Department of State consider adding a clarification to Category XII such as:

> *Category XII does not apply to items that are specifically made for non-military end uses, such as environmental/meteorological monitoring, including stationary ground-based systems and telescope instruments used in research or developed for commercial end use.*

In addition, we believe it is important to address several individual sections within the proposed regulation to add clarifications and additional definitions.

ITAR XII (b)(2)
There are commercial products (e.g., laser trackers) which meet this definition that cannot readily be converted to defense use. We recommend that the technical parameters be changed to exclude items already commercially available.

ITAR XII (b)(3)(i)(ii)
Commercially available thermal imaging infrared camera products would be ITAR-controlled under the proposed definition. We encourage DOS to reconsider the proposed technical parameters.

ITAR XII (b)(6)-(8)
Georgia Tech uses and develops LiDAR systems for a variety of research purposes ranging from environmental/meteorological projects to military applications. While the latter warrant control, under the proposed rule, some of our environmental/meteorological systems in development (and others that are commercially available) have specifications described in paragraphs (7)-(8).

Therefore, we request the Department of State consider adding a clarification to Category XII (b) (6)-(8) such as:

> *Category XII (b) (6)-(8) does not apply to LiDARs or other laser range-gated systems or equipment built for environmental, meteorological or other non-military research purposes or LiDARs or other laser range-gated systems or equipment already commercially available.*

ITAR (b)(11) - (13)
We would like to applaud the Department of State for increasing the level of power triggering control from 1W to 2W under (b)(11) and (b)(12). However, in (b)(13) the "power density of xxW/cm2" is used as a measure. The power density depends on how the laser is focused using lenses external to the laser itself. As written, this will allow for varying interpretation and confusion as the issue is primarily dependent on how the laser is focused and used. To prevent confusion and varying interpretations, we recommend that Department of State to consider clarifying Category XII (b)(13) as follows:

> *Clarify the power density in terms of Watts and focusability of the laser.*
> *Review the requirements to exclude lasers that are already commercially available.*

ITAR XII (b)(14)
As written, Category XII (b)(14) implies that the funding source (such as DOD) for research involving lasers or laser systems will dictate whether or not the systems should be controlled as a munition. Per Note 1 to paragraph (b)(14), if a contract fails to include language that the system or equipment being developed is for both civil and military applications, then the system or equipment would therefore be ITAR-controlled. It should be noted that much initial work on lasers and laser systems is internally funded research or under DOD "6.1" basic research funding, based on public domain information, or conducted by universities as fundamental research in accordance with National Security Decision Directive 189 (NSDD-189). Thus, the proposed rule differs from the current policy whereby research supported by the DOD, without access or dissemination controls, is considered fundamental research under the ITAR.

We request the Department of State to consider adding a clarification to Category XII (b)(14) such as:

> *Category XII (b)(14) excludes lasers not meeting the requirements for a military end use, even if developed or funded by the Department of Defense. Furthermore, development does not include research that meets the requirements of fundamental research.*

ITAR XII Note 2 to paragraph (c)(2): 12 (iii)
Requirements in this section may have a scientific impact in the US and may provide a competitive advantage to foreign companies that are not similarly constrained. For example, the bolometers, invented in 1878 by Samuel

Pierpont Langley, led to significant advances in research. Bolometers vary in size and technical specifications and can be purchased from a number of US Suppliers which, arguably, will have limitations and thus an economic disadvantage to non-US suppliers under the proposed requirements. Restrictions in the use of these instruments may have an impact in academic research settings if access must be controlled.

Undefined Terms ITAR XII(c)(2), (c)(4) and (c)(12)

We request the Department of State consider defining the following terms:

- *XII(c)(2) – "Integrated"*
- *XII(c)(4) – "Permanent encapsulated sensor assembly"*
- *XII(c)(12) – "Infrared imaging camera core"*

ITAR XII(c)(9)

Historically, infrared focal plane arrays (IRFPA) used in land-based telescope were developed for spaceflight or military use. However, such systems are now commonly used for many commercial applications. As written, ITAR XII(c)(9) would apply to commercially available Dewar's, cooling systems and electronics that were not specifically designed to be used with controlled IRFPAs simply because of their use with a controlled IRFPA. These commercially available devices could be purchased and used for other purposes without being subject to the ITAR, but once the products are associated with a controlled IRFPA, the devices would need to be controlled. Because these components would be subject to ITAR restrictions, details of their design or integration into the IRFPA system could not be discussed in scientific publications. However, because these are commercial products, it is very possible that details of their design and use are already in the public domain.

We request the Department of State to consider adding clarification to Category XII (c)(9) such as:

> *Category XII (c)(9) excludes IRFPA Dewar cooler assemblies and cooling systems that are commercially available or custom components made for non-military, scientific purposes including research that meets the requirements of fundamental research.*

ITAR XII(e)(7)(i)

Originally developed to compete with steam engines, Stirling cryocoolers are based upon technology that was developed in the 1800s. This technology and knowhow has been well described in the public domain and no longer warrants this level of control.

We suggest the Department of State add a clarification to Category XII (e)(7)(i) such as:

> *Category XII (c)(9) excludes Stirling cryocoolers that are commercially available or custom components made for non-military, scientific purposes including research that meets the requirements of fundamental research.*

ITAR XII(e)(9)

Is overly broad in that it can include optical elements that are not enclosed or attached to the IRFPA Dewar cooler assembly. As written, this could be read to include all optical elements within the beam path of a scientific instrument which would have unintended consequences for foreign graduate students developing custom optical elements as part of their studies.

We recommend that the Department of State reconsider Category XII (e)(9) to be more specific in its application.

ITAR XII (c), (e) and (f)

We request the Department of State to consider defining the following terms:

Resonator (it is unclear if this is for a resonator for gain).

We request the Department of State to consider adding clarification to Category XII (c) and (e) such as:

ITAR Category XII XII(c) and XII(e) excludes assemblies, parts and components that are used in conjunction with an IRFPA not meeting the requirements for a military end use.

Georgia Tech commends the Department of State on the provisions of the proposed rule and recognizes the importance of safeguarding technologies and items under ITAR XII. We appreciate the opportunity to provide the comments on the ITAR Amendment—Category XII. We hope that these comments will facilitate an understanding of how the technologies are developed and used at institutions of higher education such as Georgia Institute of Technology. The research enterprise in the United States is critical to the economic advancement of our country and having clear and concise export regulations helps ensure that innovation is not stifled in performing fundamental research.

Sincerely,

Jilda D Garton
Vice President for Research and General Manager
Georgia Tech Research Corporation
Georgia Tech Applied Research Corporation

Re: RIN 0694-AF75 - Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, Optical, and Guidance and Control Equipment the President Determines No Longer Warrant Control Under the United States Munitions List (USML) and RIN 1400-AD32 Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

Dear Sir/Madam:

Google is pleased for the opportunity to provide comments to the US Department of Commerce and the Department of State on the Export Administration Regulations (EAR) proposed rule (Department of Commerce Bureau of Industry and Security, 80 Fed. Reg. 25798 (proposed, May 5, 2015), hereinafter "Commerce Rule") and the Department of State rule (Department of State, 80 Fed. Reg. 25821 (proposed, May 5, 2015), hereinafter "State Rule"). We understand that the proposed rules in question are in furtherance of the agencies' ongoing export control reform objectives. While we appreciate the difficult undertaking that accompanies this effort, we believe the proposed rules add to the existing regulatory complexity, both from a logistical and technical perspective, rather than reduce it. As demonstrated below in our specific comments, the several proposed additions to Category XII of the United States Munitions List (22 C.F.R. Part 121, "USML") are unnecessarily overbroad and render the line between State and Commerce jurisdiction much less bright than what is accomplished under the current regulations. Furthermore, the proposed changes introduce concepts that are confusing from a technical standpoint, making the rules hard to apply in practice. Finally, under these proposed changes, a large number of commercially globally available items controlled under the EAR (15 C.F.R. Part 730 *et. seq.*) will either fall under State jurisdiction or will be subject to the same International Traffic in Arms (22 C.F.R. Part 120 *et. seq.*, "ITAR") licensing policy (i.e., a license will be required for exports and deemed exports worldwide) despite remaining under EAR control. This will serve to hurt US industry while benefiting non-US competitors. Given the current technology landscape in the affected sectors, imposing a wall around this technology will give the false illusion of protecting it, when, in reality, this technology is already available and being developed outside the US. Sealing it off in the US will force non-US companies to design out/around US components, thereby harming business for US companies in areas where the technology is already readily available from non-US suppliers. It will also likely discourage US companies from developing technology in the United States. We have provided several recommendations below in an attempt to address these issues, but ultimately, our underlying recommendation would be to re-draft the rules from scratch; tweaking them to address the problematic aspects may actually further complicate the rules and will continue the confusing layers of cross-referencing and wording inter-dependency that characterizes the proposed rules, as currently worded.

Comments to State Rule

Provision: Cat. XII(b)(6): Light detection and ranging (LIDAR), laser detection and ranging (LADAR), or range-gated systems or equipment, incorporating or specially designed to incorporate an article controlled in this subchapter (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km);

Note to paragraph (b)(6): This paragraph does not control LIDAR systems or equipment for civil automotive applications having a range limited to 200 m or less.

- **Comment**: This proposed provision would capture LIDAR systems used in self-driving car applications even if the system is solely designed for civil automotive applications. This is because it would not qualify for the "Note to paragraph (b)(6)" (hereinafter, referred to as "Civil Automotive Exception"). Specifically, the system would not meet the criteria of the Civil Automotive Exception if the range of the LIDAR system exceeds the range of 200m. It is our belief that many commercial companies are developing self-driving car LIDAR technology that would exceed 200m. In particular, we believe that the range must exceed 200m for safety reasons. For example, the system's range needs to be greater than 200m when the vehicle is making unprotected left turns in the presence of cars that are driving at higher speeds regardless of whether they decelerate or not. A greater than 200m range is also necessary for spotting oncoming emergency vehicles so that the self-driving car can safely pull over and move out of the path of such vehicles. Furthermore, in rural areas where speed limits tend to be higher, being able to detect oncoming traffic at a greater range than 200m is again important from a safety perspective.

- **Recommendation**: We request that the range in the Civil Automotive Exception be increased to 400m to account for current technology developments as well as future innovation in this space, both of which will serve to increase overall self-driving car safety.

Provision: Cat. XII(b)(8): LIDAR, LADAR, or other laser range-gated systems or equipment, as follows (MT if designed or modified for rockets, missiles, SLVs, drones, or unmanned

aerial vehicle systems capable of delivering at least a 500 kg payload to a range of at least 300 km):

(iii) Systems or equipment having an electrical bandwidth of 100 MHz or greater, and incorporating or specially designed to incorporate either a Geigermode detector array having at least 32 elements or a linear-mode detector array having at least 128 elements.

- **Comment**: This proposed provision potentially captures LIDAR systems used in civil automotive applications. Specifically, "incoming" bandwidth refers to detector bandwidth and determines minimum resolvable pulse length, which, in turn, drives minimum detectable feature separation. For a self-driving car, a sufficiently short light pulse and the ability to resolve this pulse allows the car to effectively distinguish between objects that are positioned on the same vector with respect to the car, and that are spatially close, such as a pedestrian standing near a car. Detector bandwidth determines the minimum width (in the time domain) of a resolvable pulse, which corresponds to the physical length of a collection of photons in the spatial domain. A long light pulse of 10ns (which would equate to 100MHz) is 3m long and could reflect off a pedestrian and also a vehicle 1m away from the pedestrian; a light pulse of 1ns (which would equate to 1000MHz) is 30cm long and would have separate reflections off the pedestrian and vehicle generating much more of an accurate read-out of obstacles in the vicinity. In short, having a bandwidth of 1000MHz allows the system to distinguish between objects/people that are spatially close and on the same vector and to react accordingly to achieve road safety goals. A clock bandwidth of 100 MHz is lower than many common operating bandwidths; the clock in a processor that would control even a trivial LIDAR system could be expected to run faster than 100 MHz. Furthermore, a detector bandwidth of 100 MHz is lower than a common detector and amplifier could be expected to have (and much slower than many currently available components). If the proposed control is intended to address "incoming" or detector bandwidth, it would likely capture many standard commercially available LIDAR systems that are intended and designed for civil automotive self-driving car applications.

  In addition to the bandwidth considerations noted above, we also put forth that the trigger point of 128 elements is too restrictive from a safety perspective for civilian self-driving car applications. Specifically, such cars need a LIDAR system to detect with accuracy foreign objects and debris ("FOD") on the road. The typical range of angle of slope on a road is +/-8 deg. The car needs to be a certain distance away from the FOD in order to react to it safely (150m), and a typical dangerous FOD is 15cm tall. This means that the sensor requires on the order of 250 detectors to cover the complete field of view with enough resolution to maintain safety. It should be noted that collision avoidance technology, including LIDAR systems, have been recognized as playing a key role in preventing rear-end crashes[1].

---

[1] *See* http://www.ntsb.gov/safety/safety-studies/Documents/SIR1501.pdf, and http://c.ymcdn.com/sites/www.mapps.org/resource/resmgr/Federal_Issues_LIDAR/LIDAR_Systems_and_Safety_for.pdf

Driver-assistance cars do not need this same level of FOD detection mainly because a driver would be able to step in and react whereas in a self-driving car, the system itself needs to react. As such, this parameter, as currently worded, would actually discourage safety for civilian self-driving cars.

Foreign availability: we note that many foreign manufacturers have developed technology in this space. Specifically, Reigl, an Austrian company, Sick AG, a German company and Hokuyo LTD, a Japanese company have all developed LIDAR systems that operate at over 100MHz.

- **Recommendation**: We request that the same Civil Automotive Exception (with the amendment of extending the range to 400m) that appears in the Note to paragraph (b)(6) be included in (b)(8) to avoid capturing commercial LIDAR systems that are designed and intended for use in civil automotive applications.

  If the intention is to capture "incoming" or detector bandwidth, we recommend that the limit be increased to 1000MHz which would cover a standard LIDAR system designed for civil automotive applications. We also recommend that the element trigger be "greater than 256 elements." Both of these changes would serve to encourage companies working in this space to continue to work on critical safety features.

Provision: Cat. XII(c)(2) Photon detector, microbolometer detector, or multispectral detector infrared focal plane arrays (IRFPAs) having a peak response within the wavelength range exceeding 900 nm but not exceeding 30,000 nm and not integrated into a permanent encapsulated sensor assembly, and detector elements therefor;

- **Comment**: Due to the extremely wide range of wavelength parameter, this sweeping control would potentially capture IRFPAs that are intended by design and function for use in commercial LIDAR systems used in self-driving cars. Such IRFPAs, including highly sophisticated arrays, are currently under the jurisdiction of the Commerce Department so this proposed control would have the effect of placing commercially world-wide available EAR-controlled IRFPAs under ITAR jurisdiction. This would not only have devastating effects on US businesses, but it will also serve to bolster foreign competitors' efforts in this space. Indeed, many companies may elect to move operations abroad and source commercially available non-US components to avoid the hugely negative impact of these controls.

  With respect to the term "focal plane array" itself, it is unclear whether detector elements that are purchased separately on multiple chips but are ultimately put together on a plane would actually qualify as a "focal plane array."

  Additionally, linear arrays (single line of detectors) can only form images when coupled to a scanning system, which makes them very inefficient as night vision applications, but are necessary to form the 360 degrees field of view that self-driving vehicles require.

Foreign availability: Many non-US companies have IRFPAs that would be caught by this control. For example, Hamamatsu, a Japanese company, has an array in the range of 900-1600nm that would be caught under the proposed control.

- **Recommendation:** Include an exception/carve out for IRFPAs that are specially designed and intended for use in LIDAR systems used in civil automotive applications and having a peak response within the wavelength range not exceeding 1800 nm. Also, we recommend amending the definition of an IRFPA to include the monolithic nature of it (and exclude arrays formed of multiple dies assembled together in a system) as well as exclude linear arrays.

Provision: Note 1 to paragraph (c): A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) prevents direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA without destruction or damage to the IRFPA.

- **Comment:** To our knowledge, the term "permanent encapsulated sensor assembly" is not an industry-wide used term. As such, this will inevitably lead to confusion as well as inconsistency in how it is applied when interpreting the related controls. Even with the definition provided in Note 1 to paragraph(c) as well as in sec. 772.1 of the EAR (commented on below), it is hard to apply since the requirements of the definition in their strictest sense cannot be met. Specifically, as far as we are aware, many focal plane arrays that are in some sort of encapsulation can still be disassembled without damaging or destroying the IRFPA. However, this can generally only be done by specialized tools by someone who has detailed awareness of the design of the IRFPA. Is the term "permanent encapsulated sensor assembly" intended to capture closed and non-serviceable encapsulated systems that could be disassembled by a specialized technician using specialized tools without damaging or destroying the IRFPA **or** is it only intended to capture closed and non-serviceable encapsulated systems that cannot be disassembled without damaging or destroying the IRFPA? If the latter, it is unclear to us whether any assembly would actually meet that criteria.

- **Recommendation**: If the technical data is already controlled and one would need the design technology in order to be able to disassemble the assembly without damaging or destroying the IRFPA, it makes sense to modify this note as well as the definition set forth in sec. 772.1 of the EAR to read as follows: "*A permanent encapsulated sensor assembly (e.g., sealed enclosure, vacuum package) is designed as a closed and non-serviceable system intended to prevent direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA.*"

Provision: Note 1 to paragraph (f): Technical data and defense services directly related to image intensifier tubes and specially designed parts and components therefor controlled in paragraph (c)(1) of this category, infrared focal plane arrays (IRFPAs) and detector elements therefor controlled in paragraph (c)(2) of this category, integrated IRFPA dewar cooler assemblies (IDCAs) controlled in paragraph (c)(9) of this category, wafers incorporating IRFPA or ROIC structures controlled in paragraph (e)(3) of this category, and specially designed readout integrated circuits (ROICs) controlled in paragraphs (e)(4) and (5) of this

category, remain subject to the ITAR even if the technical data or defense services could also apply to items subject to the EAR.

- **Comment**: Note 1 to paragraph (f) has the potential to yield unreasonable consequences. For example, if Manufacturer A is designing a focal plane array controlled under the EAR, the related design technology would be controlled under the EAR. If Manufacturer B takes that same technology though and designs an ITAR-controlled focal plane array, that design technology that was controlled under the EAR would now become controlled under the ITAR even though it may have nothing to do with the parameters triggering control of the focal plane array under the ITAR.

- **Recommendation**: This Note should be revised to make clear that technical data that is "directly related" to an ITAR-controlled item (covered by the mentioned controls in the Note) is limited to technology that is specific to the parameters that render the device controlled under the ITAR and would not include generic design technology for focal plane arrays that would be covered under the EAR.

<u>Comments to Commerce Rule</u>

Provision*: *§ 772.1 Definitions of terms as used in the Export Administration Regulations (EAR). Permanent encapsulated sensor assembly. (Cat 6) A permanent encapsulated sensor assembly (e.g. sealed enclosure, vacuum package) containing an infra-red focal plane array (IRFPA) that prevents direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA without destruction or damage to the IRFPA.

- **Comment**: To our knowledge, the term "permanent encapsulated sensor assembly" is not an industry-wide used term. As such, this will inevitably lead to confusion as well as inconsistency in how it is applied when interpreting the related controls. Even with the definition provided in Note 1 to paragraph(c) as well as in sec. 772.1 of the EAR (commented on below), it is hard to apply since the requirements of the definition in their strictest sense cannot be met. Specifically, as far as we are aware, many focal plane arrays that are in some sort of encapsulation can still be disassembled without damaging or destroying the IRFPA. However, this can generally only be done by specialized tools by someone who has detailed awareness of the design of the IRFPA. Is the term "permanent encapsulated sensor assembly" intended to capture closed and non-serviceable encapsulated systems that could be disassembled by a specialized technician using specialized tools without damaging or destroying the IRFPA **or** is it only intended to capture closed and non-serviceable encapsulated systems that cannot be disassembled without damaging or destroying the IRFPA? If the latter, it is unclear to us whether any assembly would actually meet that criteria.

- **Recommendation**: If the technical data is already controlled and one would need the design technology in order to be able to disassemble the assembly without damaging or destroying the IRFPA, it makes sense to modify this note as well as the definition set forth in sec. 772.1 of the EAR to read as follows: "*A permanent encapsulated sensor* *assembly (e.g., sealed enclosure, vacuum package) is designed as a closed and non-serviceable system intended to prevent direct access to the IRFPA, disassembly of the sensor assembly, and removal of the IRFPA."*

Provision: § 742.6 Regional stability. (a) * * * (8) Special worldwide RS license requirement for specified items controlled in Category 0 or 6. A license is required to export or reexport the following items to all destinations, including Canada: (i) ''Technology'' controlled under ECCN 0E987; (ii) All commodities controlled under ECCNs 6A002; (iii) All commodities controlled under ECCN 6A990; (iv) ''Software'' controlled under ECCN 6D002 for the ''use'' of commodities controlled under 6A002.b; (v) ''Software'' controlled under ECCN 6D003.c; (vi) ''Software'' controlled under ECCN 6D991 for the ''development,'' ''production,'' or ''use'' of commodities controlled under ECCNs 6A002, 6A003, or 6A990; (vii) ''Software'' controlled under ECCN 6D994; (viii) ''Technology'' controlled under ECCN 6E001 for the ''development'' of commodities controlled under 6A002 or 6A003; (ix) ''Technology'' controlled under ECCN 6E002 for the ''production'' of commodities controlled under 6A002 or 6A003; (x) ''Technology'' controlled under 6E990; and (xi) ''Technology'' controlled under ECCN 6E994.

- **Comment**: This proposed regional stability reason for control imposes a worldwide licensing requirement for items classified under several ECCNs. Not only is this type of global control unprecedented under the EAR, but, in addition, it is being imposed on several items that were previously classified as EAR99 (e.g., those items covered under newly created ECCNs 6D994 and 6E994 as well as the additional items that will now be caught under the proposed re-wording of ECCN 6A990 which would expand its scope to include ROICs for *all focal plane arrays* controlled under 6A002a.3). In short, this means that items that previously required no license at all (except for export to the embargoed countries) will now require an export license to be shipped everywhere including Canada. Needless to say, this will result in a huge burden on industry as well as the Commerce Department, which will have to process both additional export/reexport and deemed export/deemed reexport license applications for the covered items. Since projects involving this type of technology and source code have not been thus far subject to restrictive export controls, it is highly likely that non-US nationals have already been working on them and continue to work on them today. It is also fairly common for collaboration on projects to occur across offices and across countries. The proposed control would require limiting cross-country collaboration, restricting those who can work on the projects to US nationals and/or obtaining licenses for all non-US nationals working on the project. Applying for export and deemed export licenses would impose a large burden on both the Commerce Department and industry, as described earlier, and raises other issues caused by a shift in licensing policy, described further below. It will also inevitably affect the marketability of US parts and components as well as software and technology.

Provision: (b) Licensing policy.—(1) Licensing policy for RS Column 1 items or items subject to worldwide RS control…(iv) Applications for exports or reexports of software or technology described in paragraphs (a)(8)(i), (a)(8)(iv), (a)(8)(v), (a)(8)(vi), (a)(8)(viii), and (a)(8)(x) will be reviewed with a presumption of denial. There is also a presumption of denial for technology described in paragraph (a)(8)(ix), unless it is ''build-to-print technology'' that is required for integration, mounting, inspection, testing, or quality assurance (e.g., necessary to meet International Standards Organization (ISO) certification), which will be reviewed on a case-by-case basis.

- **Comment**: Under the proposed licensing policy for items subject to the RS worldwide control, many items that are currently EAR99 (items controlled under the proposed rewording of 6A990) in addition to numerous other items controlled under 6A002, 6D003.c, and 6E001 that were eligible for various license exceptions would now be subject to a licensing policy of denial. This shift in licensing policy, creation of a worldwide licensing requirement, and removal of eligibility of certain license exceptions serve to pseudo-treat these items as ITAR-controlled even though these items are actually currently controlled under the EAR. This would serve to potentially severely impact US industry as companies seek alternative options that would not be tainted by US export licensing policies in this space. Similar long-lasting repercussions were seen in the space and satellite industry when those areas were subjected to ITAR controls and foreign companies then looked to suppliers outside the US (with some foreign companies specifically desiring to go "ITAR free") to avoid subjecting their products and technologies to control under the ITAR. In our view, this would not fall within the spirit of export control reform.

Provision: 6D991 ''Software,'' n.e.s., ''specially designed'' for the ''development'', ''production'', or ''use'' of commodities controlled by 6A002, 6A003, 6A990, 6A991, 6A996, 6A997, or 6A998.

- **Comment**: The proposed revision to 6D991 results in controlling software that is currently controlled as EAR99 (e.g., software "specially designed" for the "development," "production," or "use" of all 6A002 and 6A003 items). Furthermore, the reason for control of RS would result in a license being required for all covered software to all countries and non-US nationalities in the case of deemed exports. Again, controlling this type of software would be disruptive to industry since much of this software is currently non-controlled. Moving from a state of non-control to a state of highly-controlled will inevitably result in large impact from a licensing perspective as well as from a cross-nationality and cross-country collaboration perspective. Finally, such a control will help further non-US business interests working in this space whose software and technology are not subject to unilateral US export controls.

Provision: 6D994 ''Software'', n.e.s., ''specially designed'' for the maintenance, repair, or overhaul of commodities controlled by 6A002, 6A003, or 6A990.

Provision: 6E994 ''Technology'' ''required'' for the maintenance, repair, or overhaul of commodities controlled under 6A002, 6A003, or 6A990.

- **Comment**: The proposed creation of ECCNs 6D994 and 6E994 would result in controlling low-level software and technology that is currently non-controlled (i.e., EAR99) and already developed abroad by various non-US focal plane array manufacturers. Furthermore, the reason for control of RS would result in a license being required for all covered software and technology to all countries and non-US nationalities (in the case of deemed exports). Thus, we would move from a regulatory environment of not requiring any export or deemed export licenses (except for the embargoed countries) to one where licenses would be required for all covered items regardless of destination or nationality. Again, we believe this would create a significant burden on both US companies and BIS. Further, it would serve to ultimately hurt US businesses by having the secondary effect of encouraging the use of non-US manufacturers and developers so as to avoid the draconian implications that would result from using items that are subject to ITAR-like licensing requirements and policies.

Please do not hesitate to contact us via email (lianasebastian@google.com) or phone (650-214-3036) with any questions or comments regarding this submission.

Sincerely,

Liana Sebastian

Comments on "Amendments to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII"

Comments on "Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, Optical, and Guidance and Control Equipment the President Determines No Longer Warrant Control under the United States Munitions List (USML)"

Please find attached the Government of Canada's comments on the subject proposed rules.

Canada supports the U.S. Administration's overall goal of strengthening national security by undertaking reforms that will significantly reduce the regulatory burden and costs associated with no- to low-risk transactions of controlled goods. However, Canada is concerned that the proposed imposition of a new licencing requirement would not achieve this objective by causing unnecessary complications to the highly integrated defence industrial base we share. Accordingly, Canada respectfully requests that the proposed rules be revised to ensure that under their final form, no item will require an export licence to Canada where none is presently required.

During the regulatory review process, Canadian and U.S. officials have maintained a much- appreciated dialogue regarding the proposed changes. We remain available for further cooperation to find mutually beneficial solutions.

Sincerely,

Gilles Gauthier
Minister (Economic)

Canada

Comments on Amendments to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

Comments on Revisions to the Export Administration Regulations (EAR): Control of Fire Control, Range Finder, Optical, and Guidance and Control Equipment the President Determines No Longer Warrant Control under the United States Munitions List (USML)

The Government of Canada welcomes the opportunity to provide comments on the proposed changes to the *International Traffic in Arms Regulations: U.S. Munitions List Category XII - Fire Control, Range Finder, Optical, and Guidance and Control Equipment;* and the *Revisions to the Export Administration Regulations (EAR) Commerce Control List Category 6 – Sensors and Lasers.*

Canada and the U.S. share the responsibility of continental defence and we both benefit from an integrated industrial base. As such, Canada is encouraged by President Obama's comprehensive inter-agency review of the U.S. export control system, also known as Export Control Reform (ECR). However, Canada wishes to express its concern that, under the proposed regulatory changes, a significant number of products currently listed under the *U.S. Department of Commerce's Commerce Control List Category 6* (Sensors and Lasers) may require an export licence to Canada, where none is currently required.

For example, under the proposed rule, commercial items related to infrared detection, and their associated software and technology, which currently may be exported to Canada without an individual license, would be subject to new license requirements. These items include optical detectors, image intensifier tubes, focal plane arrays and read-out integrated circuits that are used in cameras and other equipment. These items have extensive and growing uses in commercial applications, such as industrial process control, gas detection, mapping, home inspection, spectroscopy, semiconductor, search and rescue, maritime, security surveillance, firefighting, medical imaging, laboratory, astronomy and automotive applications.

As such, Canada respectfully requests that in further reviewing the proposed changes, due consideration be given to the following factors: the existing cooperation between our countries on issues relating to exports controls at multilateral, regional and bilateral levels; the longstanding Canada-U.S. defence relationship; the highly integrated Canada-U.S. defence industrial base and trade relationship; the reciprocity of favourable export regulations between trusted partners; and the goals of the Export Control Reform to strengthen national security by undertaking reforms that will significantly reduce the regulatory burden and costs associated with no- to low-risk transactions of controlled goods.

1. The proposed regulatory changes should take into account the longstanding Canada-U.S. defence relationship

Canada and the United States are each other's most important security and defence partners. Defence relations between our two countries are longstanding, well entrenched and highly successful. Since World War II, the two countries have successfully shared defence resources to secure supply and defend North America. There are more than 600 Memoranda of Understanding (MOUs) and agreements between the two nations supporting joint cooperation mechanisms, development of defence technology and the interoperability of our fighting forces.

Our militaries need to continue to work together to meet our respective defence and security needs and that of our allies and foreign partners. As such, requiring a new export licence for certain products to Canada challenges existing policies in defence cooperation.

Canada respectfully requests that proposed regulatory changes reflect the historical and political relationship between Canada and the U.S. in the exchange of defence goods.

2. The proposed regulatory changes should not negatively impact the highly integrated Canada-U.S industrial base

Over the past four years, the United States exported over USD $1.1 billion in military equipment, binoculars, and laser equipment to Canada which includes products under *USML Category XII* classification of *Fire Control, Range Finder, Optical, and Guidance and Control Equipment* defence products.

Our longstanding defence relationship has helped develop and sustain a deeply integrated defence industrial base that is celebrated on both sides of the border. Just recently, the House Armed Services Committee highlighted the importance of the North American Defence Industrial Base in its report accompanying the *National Defence Authorization Act*, noting that:

> The committee acknowledges the vital role played by the defense industrial base in supporting the Armed Forces of the United States, noting that a cost-effective, healthy base that is responsive to U.S. military requirements is essential to achieving U.S. national security objectives. The committee further notes that in light of robust trade relations, a shared interest in the defense of North America, and responsibilities as the only North American allies within the North Atlantic Treaty Organization, both the United States and Canada benefit from the North American Defense Industrial Base relationship. Therefore, the committee is supportive of the strong, integrated, and widely dispersed industrial base in North America reflecting the economical use of research, development, and production resources, as laid out in the Department of Defense Instruction 2035.01 dated February 27, 2006.

The Canadian defence and security industrial base consists of over 2,000 firms, many of which have parent companies or subsidiaries in the United States. Every day, U.S. and Canadian firms work in collaboration to service defence contracts in both countries and abroad. In fact, every year, the Canadian Commercial Corporation manages, on average, $1 billion in contracts for goods and services delivered by Canadian companies to the DOC and NASA. Companies on both sides of the border established product lines, marketing plans, distribution networks, and supply chains based on the current regulatory environment. A tightening of controls, as proposed in the revised rules, would disrupt these trade flows.

Canada respectfully requests that proposed regulatory changes consider the economic impact upon our integrated defence industry.

3. The proposed regulatory changes should maintain reciprocity regarding export control regulations between trusted partners

The unilateral imposition of an export licence would increase unnecessary administrative costs in the exchange of defence and security products. Since the Second World War, Canada and the U.S. have not required export permits on many military and strategic goods and technology traded between them under the ITAR, EAR and Canada's Export Control List, an arrangement which Canada believes continues to serve our mutual interests.

From Canada's perspective, the goods and technology that will be affected by this proposed regulatory change do not represent a strategic risk to regional defence and security for export to the United States. However, under the proposed regulatory changes, the same items exported to the U.S. without a Canadian permit would require a U.S. licence to be re-exported back to Canada. This policy change would result in undue administrative burden unbecoming of our historical reciprocity.

Canada respectfully requests that the proposed regulatory changes consider existing policies that promote the reciprocity of trade of controlled goods and technology.

4. The regulatory changes should reflect ongoing Canadian and U.S. cooperation on export control issues at the multilateral, regional and bilateral levels

Canada and the U.S. have a long history of cooperation on export control issues at the multilateral, regional and bilateral levels. Both countries, as members of all the multilateral export controls regimes, have worked together to address issues of mutual concern relating to the control of strategic and military goods and technology around the world. The same can be said for the export control-related cooperation of both countries at the Organization of American States.

The establishment of Canada's *Controlled Goods Program,* which aligns itself with the *U.S. International Traffic in Arms Regulations,* and the fact that Canada closely controls the export of ITAR controlled goods and technology from Canada both clearly demonstrate Canada's on-going bilateral commitment to this important issue.

Canada respectfully requests that proposed regulatory changes consider bilateral, regional and multilateral regulatory cooperation commitments and initiatives.

In summary, Canada supports the U.S. Administration's overall goal of strengthening national security by undertaking reforms that will significantly reduce the regulatory burden and costs associated with no- to low-risk transactions of controlled goods. However, Canada is concerned that the proposed imposition of a new licencing requirement would not achieve this objective by causing unnecessary complications to our highly integrated defence industrial base. For these reasons, we respectfully request that the proposed rules be revised to ensure that under their final form, no item will require an export licence to Canada where none is presently required.

During the regulatory review process, Canadian and U.S. officials have maintained a much appreciated dialogue regarding the proposed changes. We remain available for further cooperation to find mutually beneficial solutions.

Additional technical information and questions regarding our concerns are set out below.

1. Canada understands that under the proposed changes to the Department of State (DOS) International Traffic in Arms Regulations (ITAR) - United States Munitions List (USML) Category XII(c), the items identified to remain on the ITAR are understood to be the "highest sensitivity" and as there are no changes proposed to ITAR s.126.5 – "Canadian Exemption", the items remaining in USML Category XII(c) will remain licence free to Canadian federal, territorial, provincial and municipal departments. It is also understood that exports of Department of Commerce (DOC) controlled night vision / optical sensor items could be exported to Canadian Federal departments in accordance with the DOC "GOV Licence Exception".

   Nonetheless, the "second tier" and "less sensitive" night vision / optical sensor items on the DOC – Export Administration Regulations (EAR) - Commerce Control List (CCL), which for decades have benefited from the DOC licence free status to Canada, will now be subject to new licencing requirements to virtually every entity in Canada including Canadian territorial, provincial and municipal departments. The DOC controlled night vision / optical sensor items have extensive and growing uses in commercial applications, such as industrial process control, gas detection, mapping, home inspection, spectroscopy, semiconductor processing, search and rescue, maritime, security surveillance, firefighting, medical imaging, laboratory research, astronomy and automotive applications.

   What statistics, if any, are available on the volume of trade in commercial night vision / optical sensor items that would be affected by the proposed DOC licencing requirements to Canada?

2. As the items to remain on the DOS ITAR are understood to be of the "highest sensitivity", the second generation *Image Intensifier Tubes (IIT)* that will continue to be controlled on the DOS ITAR (i.e., proposed Category XII (c)(1)(i)) will remain licence free under the DOS ITAR s.126.5 - Canadian Exemption for Category XII(c) to Canadian Registered entities. As this is the case, why are the "less sensitive" and "second tier" items on the DOC CCL being proposed to be licenced to Canada?

3. The DOS ITAR proposed parameters for *IITs* should include an additional control criterion, such as a reliability parameter, to address the environment in which these devices will be required to survive, and thereby clearly distinguish these devices from similar commercially available devices from foreign suppliers such as Hamamatsu, Photonis, Delft Electronic Products and Photek.

4. In the DOC EAR and DOS ITAR currently in-force today there is delineation in the DOS ITAR which establishes which *IITs* are controlled by DOS and those controlled by DOC. However, no such delineation exists in the DOS ITAR for *Focal Plane Arrays* (*FPA*). According to the current DOS ITAR, only those *FPAs* that are specially designed, modified or configured for military use are currently subject to DOS ITAR control. The DOS ITAR

proposed parameters for *FPA*s should include an additional criterion, such as a reliability parameter, to address the environment these devices will be required to survive in, and thereby clearly distinguish these devices from commercially available devices from foreign suppliers such as Sofradir, Selex and Optikos.

5. In order to conduct an impact analysis of the *FPA* proposed regulations on Canada (industry interests and government programs), under what authority (DOC or DOS) are *FPAs* currently controlled, and what is the current technical criterion which differentiates the jurisdiction between DOC and DOS?

6. In the DOC EAR and DOS ITAR currently in-force today there is delineation in the DOS ITAR which establishes which *IITs* are controlled by DOS and those controlled by DOC. However, no such delineation exists in the DOS ITAR for *Electron Multiplication Charge Coupled Devices (EMCCDs).* Although *EMCCDs* are not specifically listed by nomenclature in the DOS ITAR currently in-force today, it is understood that those *EMCCDs* that are deemed to be "other night sighting equipment or systems" that are specially designed, modified or configured for military use are currently subject to DOS ITAR control. The DOS ITAR proposed parameters for *EMCCDs* should include an additional criterion, such as a reliability parameter, to address the environment in which these devices will be required to survive, and thereby clearly distinguish these devices from commercially available devices from foreign suppliers such as E2V and Andor Technologies.

7. In order to conduct an impact analysis of the proposed *EMCCD* regulations on Canada (industry interests and government programs), under what authority (DOC or DOS) are *EMCCDs* currently controlled and what is the current technical criteria which differentiates the jurisdiction between DOC and DOS?

8. The term *"permanent encapsulated sensor assembly"*, is not an industry standard term and, although the proposed regulations provide a subjective definition, how will the exporting community know at what point an item becomes a *"permanent encapsulated sensor assembly"*?

9. For the term *"permanent encapsulated sensor assembly"*, what criteria will be used to gauge what "degree of damage" is sufficient to comply with the requirement?

10. Are there specific examples of *FPAs* that would meet the definition of *"permanent encapsulated sensor assembly"*, and those that would not meet this definition?

11. In the DOC EAR and DOS ITAR currently in-force today there is no definition for *"permanent encapsulated sensor assembly"* to establish what items are controlled by DOS and those controlled by DOC. To conduct an impact analysis of the proposed regulations on Canada (industry interests and government programs), what items are currently considered *"permanent encapsulated sensor assemblies"*, under what authority (DOC or

DOS) are *"permanent encapsulated sensor assemblies"* currently controlled, and what is the current technical criteria which differentiates the jurisdiction between DOC and DOS?

12. Although the term *"camera core"* is used by industry, there are differing opinions amongst manufacturers as to what constitutes a *"camera core"*. How will the public know at what point an item becomes *"camera core"*? Also, it would appear only the proposed DOS ITAR uses the term *"camera core"* and as such, it would be important to clarify what is the equivalent term / area in the proposed DOC EAR.

13. In the proposed DOS ITAR the term *"camera core"* includes additional terms "e.g., modules, engines, kits". Are these terms meant to be equivalent to *"camera core"* and, if so, is there a minimal electronic configuration necessary to establish a "module or kit"?

14. What are the unique characteristics which distinguish a *"fully packaged consumer ready camera"* from a *"camera core"*?

15. In the DOC EAR and DOS ITAR currently in-force today there is no definition for *FPA camera core* to establish what items are controlled by DOS and those controlled by DOC. Although *FPA camera cores* are not specifically listed by nomenclature in the DOS ITAR currently in-force today, it is generally accepted that a *FPA camera core* is the higher level assembly that includes a *FPA* subcomponent, and as such, only those *FPA camera cores* that are specially designed, modified or configured for military use are currently subject to DOS ITAR control.

    In order to conduct an impact analysis of the proposed *FPA camera core* regulations on Canada (industry interests and government programs), what items are currently considered *FPA camera cores*, under what authority (DOC or DOS) are *FPA camera cores* controlled presently and what is the current technical criteria which differentiates the jurisdiction?

16. In the DOC EAR and DOS ITAR currently in-force today there is no definition for *EMCCD camera core* to establish what items are controlled by DOS and those controlled by DOC. Although *EMCCD camera cores* are not specifically listed by nomenclature in the DOS ITAR currently in-force today, it is understood that those *EMCCD camera cores* that are deemed to be specially designed or modified components of "other night sighting equipment or systems" that are specially designed, modified or configured for military use are currently subject to DOS ITAR control.

    In order to conduct an impact analysis of the proposed *EMCCD camera core* regulations on Canada (industry interests and government programs), what items are currently considered *EMCCD camera cores*, under what authority (DOC or DOS) are *EMCCD camera cores* currently controlled and what is the current technical criteria which differentiates the jurisdiction between DOC and DOS?

17. Although the "chapeau" text for the DOC CCL Export Commodity Control Number (ECCN) 6A615 identifies the category as "military", the individual items are not described with the phrase "*are "specially designed" for a USML defence article or a "600 series" ECCN*" as they are specified in other entries in the 600 series. What was the rationale for removing the phrase "*are "specially designed" for a USML defence article or a "600 series" ECCN*"?

18. *Read Out Integrated Circuits (ROIC)*, both off-the-shelf and custom designs, are available from various manufacturers worldwide such as Xenics Infrared Solutions, AIM Intranot-Module, and New Imaging Technologies. The technology necessary to develop and manufacture *ROICs* has been available internationally for many years. The proposed DOC EAR establishes a worldwide control with a presumption of denial. What statistics are available on the volume of trade in commercial *ROICs*, the technology for the development of *ROICs*, and the technology for the production of *ROICs* that would be affected by the proposed DOC licencing requirements to Canada?

Ref: ITAR Amendment – Category XII; RIN 1400-AD32 / Public Notice 9110
EAR Amendment – RIN0694-AF75

Harris Corporation is pleased to comment on the proposed revisions to U.S. Munitions List (USML) Category XII and the corresponding controls on the Commerce Control List. Harris appreciates the work that went into crafting the revisions and is encouraged with the continued progress on the Export Control Reform Initiative. However, while the positive listing of items subject to controls, particularly as addressed in the XII(e) enumerated parts and components subparagraphs, is a welcome improvement on the current regulations, we are disappointed that many items with widespread commercial availability in foreign markets will remain controlled under the ITAR, hampering our ability to compete effectively in the global marketplace. We sincerely hope that the proposed changes are a first step towards ultimately relaxing controls on items that no longer merit heightened restrictions for exports to our allies and friendly foreign governments.

ITAR Amendments

Specially Designed Parts and Components

The proposed rule creates an apparent control inversion between the generic specially designed "catch-all" language within the proposed USML XII(c)(1) and XII(c)(13) entries and the specifically enumerated parts, components and other commodities included in the proposed USML XII (e)(2)(i) – (vii) and USML XII(e)(9), and (12) entries.

The IIT parts and components enumerated within XII (e)(2) represent the most critical and sensitive parts and components of an image intensifier tube due to their unique contributions to military night vision systems utilizing IIT. The listing of those parts and components helpfully adds specific performance and quantitative criteria which provide a bright line for quick identification of the parts and components intended to be controlled.

However, the proposed USML XII(c)(1) entry, which describes the IIT's to which XII (e)(2) applies, contains its own specially designed parts and components "catch-all" clause. This results in an apparent logical paradox that subjects non-enumerated specially designed parts and components excluded from the scope of USML XII (e) (2) to higher level controls as Significant Military Equipment (SME), as they would necessarily be captured within USML XII(c)(1) by default. For example, under the proposed rule, a specially designed sub component of a XII(e)(2)(vi) miniature autogated power supply would be controlled under XII(c)(1) as SME, representing a higher level of control for the lower level part than the completed autogated power supply component .

To address this issue, Harris recommends that the generic, specially designed parts and components "catch-all" language be removed from USML XII(c)(1) and that equivalent language be added to USML XII(e)(2) as follows:

> *(c) Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:
>
> (1) Image intensifier tubes (IITs) having a peak response within the wavelength range exceeding 400 nm but not exceeding 2,050 nm and incorporating either a microchannel plate described in paragraph (e)(2)(i) of this category or electron sensing device described in paragraph (e)(2)(iv) of this category, as follows: [~~**and specially designed parts and components therefor:**~~]
>
> *****
>
> (e) Parts, components, accessories, attachments, and associated equipment as follows:
>
> *****
> (2) Image intensifier tube (IIT) parts and components as follows:
>
> *****
> **(viii) Parts and components specially designed for IIT's identified in USML XII(c)(1).**

The proposed revisions recommended above additionally ensure alignment with language contained within **Note 2 to paragraph (f)**, which identifies IITs and their parts and components as being controlled within two distinct entries.

> "...*IITs controlled in paragraph (c)(1)* of this category and their *parts and components controlled in paragraph (e)(2)* of this category..." [emphasis added]

The proposed entries for USML XII(c)(12) and (13) relating to binoculars, goggles, and other imaging systems and infrared imaging cores also include "specially designed" catch all clauses which create a similar control inversion problem (SME vs. non-SME) with respect to the parts and components specifically identified in proposed USML XII(e)(9), and (12).

Harris recommends that the specially designed language of USML XII(c)(12) and (13) likewise be omitted, and that language with similar effect be inserted as a new entry into the text of USML XII(e)(9), and (12) to ensure that parts and components intended to be "caught" under USML XII(c)(12) and (13) are identified and proportionally controlled, as follows:

> *(c) Infrared focal plane arrays, image intensifier tubes, night vision, electro-optic, infrared and terahertz systems, equipment and accessories, including cameras and cores, as follows:

****

(12) Infrared imaging camera cores (e.g., modules, engines, kits), [~~**and specially designed electronics and optics therefor,**~~] having any of the following:

(13) Binoculars, bioculars, monoculars, goggles, or head or helmet-mounted imaging systems or equipment (including video-based articles having a separate near-to-eye display) that incorporate or are specially designed to incorporate any of the following, [~~**and specially designed electronics, optics, and displays therefor:**~~]

*****

(e) Parts, components, accessories, attachments, and associated equipment as follows:

*****

(9) **Optics, i**nfrared lenses, mirrors, beam splitters or combiners, filters, and treatments and coatings, specially designed for any article controlled in this category;

*****

(12) **Displays (including near-to-eye displays)** specially designed for articles controlled in this category;

Harris notes that its recommended revision of USML XII(e)(12) does not overlap with the current proposed entry at USML XII(c)(18), "Near to eye display *systems or equipment…*" [emphasis added], as the former is obviously intended to encompass the display component, whereas the latter addresses completed systems or equipment, more logically subject to control as SME.

Note to paragraph A of note 2 to paragraph (f)

After careful study of this note, Harris concludes that the listed technical data exclusion categories are limited exclusively to data and classes of activity relating to IRFPAs rather than broadly to all the items discussed within Note 2 to paragraph (f), e.g. lasers, ITTs, etc. If the desired intent is properly understood, Harris suggests the following revision to avoid the potential for ambiguity:

Current proposed rule wording:

Note to paragraph A of Note 2 to paragraph (f): Technical data does not include information directly related to basic operating instructions, testing results, incorporating or integrating IRFPAs into higher level packaged assemblies not enumerated in this category, or external interface control documentation associated with such assemblies or assemblies subject to the EAR, provided such information does not include design methodology, engineering analysis, or manufacturing know-how for a USML controlled IRFPA.

Recommended revision:

Note to paragraph A of Note 2 to paragraph (f): Technical data **directly related to IRFPAs** does not include information ~~**directly related to**~~ **on** basic operating instructions, testing results, incorporating or integrating IRFPAs into higher level packaged assemblies not enumerated in this category, or external interface control documentation associated with such assemblies or assemblies subject to the EAR, provided such information does not include design methodology, engineering analysis, or manufacturing know-how for a USML controlled IRFPA.

EAR Amendments

It appears that EAR 742.6(a)(8)(ii) will require that a license be obtained to export or re-export to Canada, items subject to control under ECCN 6A002 for Regional Stability (RS) purposes.

The licensing requirement would be a departure from the way more sensitive items are controlled under U.S. Munitions List (USML) Category XII(c). By way of example, if a Generation 3 image intensifier tube (IIT) is incorporated into a commercial direct view night vision system, the system would be controlled under ECCN 6A002.c, as described in Note 2 to paragraph XII(c) on the USML. If the same IIT were incorporated into a night vision device specially designed for the military, it would be controlled under USML XII(c)(13). The new RS control would require a license to Canada for the 6A002.c item, while by contrast the ITAR exemption at 22 CFR 126.5(b) and (d) would continue to authorize exports, re-exports, and retransfers of XII(c)(13) items to certain end users in Canada.

At a high level, following is a summary of the ITAR exemption as it applies to USML XII(c) items:

- Canadian government entities (e.g., federal , provincial, territorial, or municipal) are eligible to receive: 1st- and 2nd-generation image intensification tubes and night sighting equipment, 3rd-generation end items
- Canadian-registered persons are eligible to receive: 1st- and 2nd-generation image intensification tubes and night sighting equipment

It does not appear that 6A002.c items would be eligible for EAR exceptions STA or GOV for exports to the end users identified in the ITAR exemption.

Harris respectfully requests that the Commerce Department consider the implementation of EAR licensing exception authority for 6A002 items similar to the Canadian license exemption authority available for items subject to control under USML XII(c).

Sincerely,

Mary C. Menz

ATTN: Mr. C. Edward Peartree, Director, Defense Trade Controls Policy

SUBJECT: Honeywell Response to Proposed USML Category XII Changes

Reference: Federal Register Vol. 80, No. 86, amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII, published May 5, 2015.

Dear Mr. Peartree:

Honeywell International Inc. provides the following comments with regard to the proposed changes to ITAR Category XII, and specifically to the proposed language in Category XII(d) which covers inertial systems and components.

The proposed rule as written appears to introduce the potential for significant unintended consequences, where currently certain Commerce Control List (CCL) sensors (accelerometers and gyros) that are incorporated into FAA civil certified systems/aircraft and used for other commercial applications would become ITAR controlled. This is based, in part, on the fact that the proposed performance criteria and testing protocols for accelerometers and gyros differs substantially from the current criteria established in the U.S. Department of Defense Inertial Navigation System Policy (DOD INS Policy) of 2010.

Honeywell appreciates the effort to introduce a proposed rule that more clearly defines specific items that would be subject to the ITAR. The following comments outline Honeywell's concerns with the proposed rule.

Proposed Control Language for Gyros and Accelerometers:

The language in "Category XII(d)(2) Accelerometers" would now define USML accelerometers as those accelerometers having a bias stability of better than 20 micro-g's or scale factor stability of better than 20 parts per million. The term "stability" is not defined in the ITAR text, but does have definition in the U.S. Department of Commerce regulations, and by the IEEE, and involves performance measurement during fixed operating conditions. Under these benign conditions, the types of accelerometers that are in use in commercial inertial systems exhibit very good bias and scale factor performance. As a result, Honeywell believes that a majority of accelerometers currently on the CCL would be captured by the USML with this proposed language.

The language in "Category XII(d)(3) Gyroscopes" would now define USML gyros as those gyros that have an Angle Random Walk (ARW) better than 0.00125 degree per square root hour or that have a bias stability better than 0.0015 degrees per hour. The ARW control is a well understood measurement and a reasonable choice for performance control. However, there are commercial inertial systems in civil aircraft that have ARW values better than this level. Honeywell believes

Honeywell
101 Constitution Avenue, N.W.
Suite 500 West
Washington, DC 20001
202-662-2650

the control level should be no larger than 0.0010 degrees per square root hour to avoid controlling civil aircraft systems. The larger problem is with the inclusion of bias stability as a control, which will cause most civil aircraft and other ring laser gyro based commercial inertial systems to be captured under the munitions list, which we do not believe was the intent of the control.

Honeywell believes the more effective method for assessing gyro and accelerometer performance is aligned with the U.S. Department of Defense Inertial Navigation System Policy (DOD INS Policy) of 2010, which differentiates systems that are effective in higher performance military applications from those that are not. The measurements in the DOD INS Policy reflect gyro and accelerometer performance allowing for inclusion of measurement of bias over the operating conditions that the system must perform in, makes clear that the performance applies to product lines, not individual accelerometers and gyros, and does not depend on the "stability" term.

Additional comments:

1) The addition of "MT" in the proposed language for XII(d)(2) and XII(d)(3) is confusing. Adding (MT) reasons for control on the USML implies that performance at these levels places the item in XII(d), while export classifications 7A101 and 7A102 in the U.S. Commerce Department Export Administration Regulations are actually the controls implementing these particular Missile Technology Control Regime agreements.

2) Language in the proposed rule references VIII(e). This reference should be removed if it is the Department of State's intent to move VIII(e) controlled inertial devices to the new controls in XII(d) and 7A611.a of the EAR.

3) Honeywell recommends adding the term "specially designed" to Cat. XII(d) for inertial components (gyros and accelerometers). This would ensure that only sensors "specially designed" with values described in Cat. XII(d) are subject to control under the USML.

4) XII(d)(1)(iii) catches any guidance or navigation system (including units such as IMU, AHRS) that are specified to function at linear acceleration levels exceeding 25g. Honeywell believes there are commercial systems that would be caught by this control language that are not high performance and are designed for commercial use.

5) XII(d)(2) for accelerometers applies an "OR" term such that bias stability "or" scale factor stability will cause an accelerometer to be captured. The DOD INS Policy requires specific levels of bias "AND" scale factor performance, which avoids capturing accelerometers currently used in commercial aircraft.

If you have any questions or would like to discuss any of the comments provided above, feel free to contact the undersigned at 202-662-2641 or via e-mail at dale.rill@honeywell.com.

Sincerely,

Michael Scoggin for

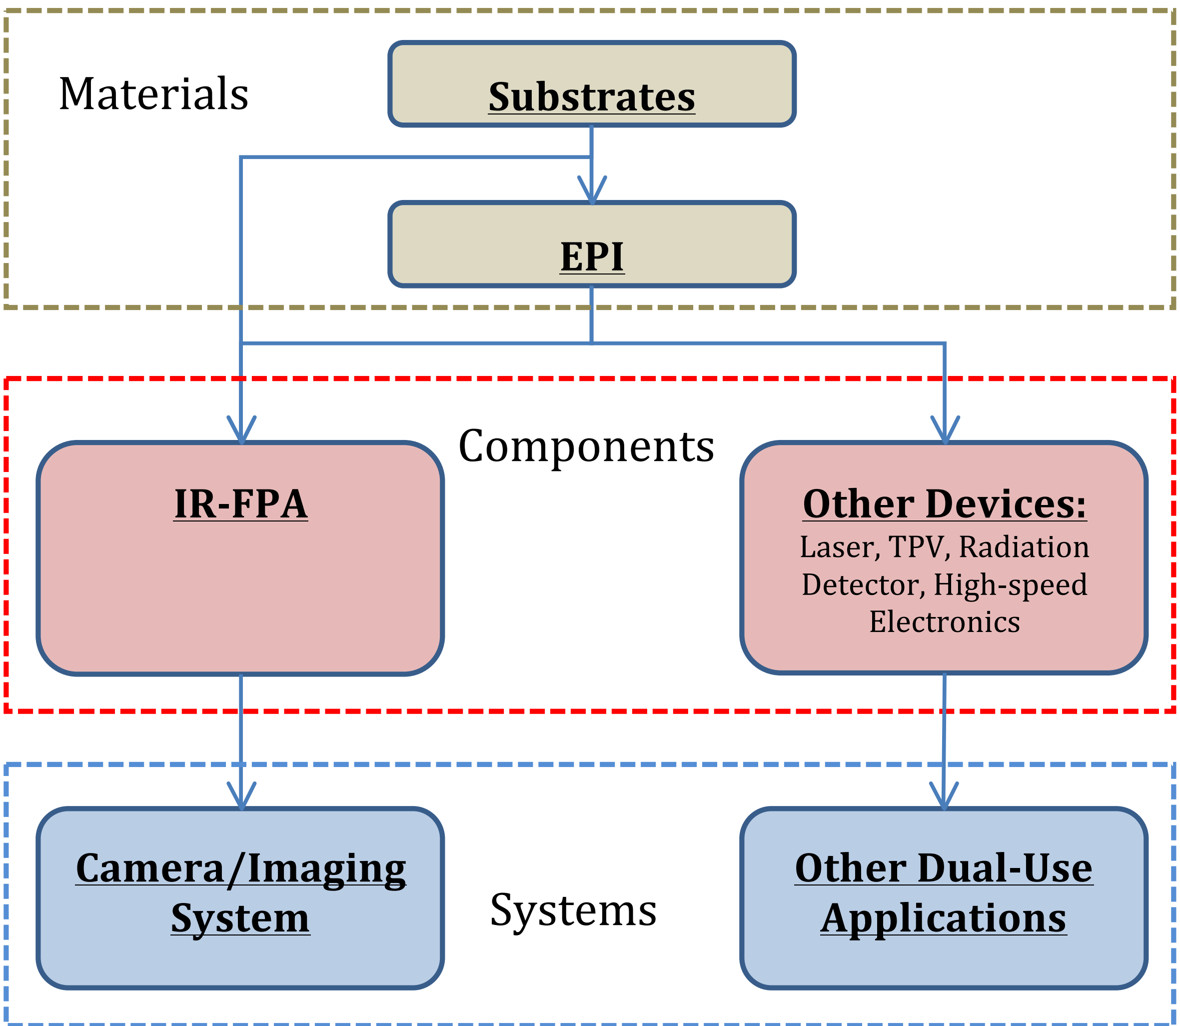
Subject: Amendment to the International Traffic in Arms Regulations: Revision of U.S. Munitions List Category XII

To Whom It May Concern:

Intelligent Epitaxy Technology, Inc. (IET) was first established in January 1999 in Richardson, Texas to supply epitaxy-based compound semiconductor epi-wafers to the electronics and optoelectronics industries. This covers epitaxy materials grown on GaAs, InP, GaSb, InSb and Si. In recent years, IET has also expanded the business vertically into specialty substrate area such as GaSb as well. Our primary business is the development and production of starting materials which include specialty semiconductor substrates and epitaxy materials as shown in the supply chain diagram below.



1250 E. Collins Blvd.
Richardson, TX 75081
(972) 234-0068

In the current re-write of USML Category XII, may of our key products would be controlled under paragraphs c(2) and e(3) specifically for IR FPAs and their components. These entries would control substrate/epi materials products produced and sold by IET. We believe the current language for these entries would be overly restrictive, controlling products with dual-use applications while failing to achieve the goals of the ECR guideline. More specifically, it is our belief that the current language is trying to protect too much, which will diminish the government's ability to focus efforts on the most critical national security priorities. Furthermore, these restrictions will end up destroying the US manufacturability and competitiveness that the USML code is hoping to protect. Foreign completion will end up gaining market share and eventually force US manufacturing base to exit these markets all together.

I. Substrate

During the past several years, IET has established a domestic GaSb wafer manufacturing capability in the US with funding support from the DOD. Right now, IET is offering 2", 3" and 4" sizes commercially and with larger sizes in development. This is to support internal use, as well as, external commercial customers. The primary market for these GaSb substrates are for epitaxy growth of IR detector materials. Under the current language proposed for paragraphs c(2) and e(3), these substrates will be under ITAR control. However, GaSb substrates are also in non-military commercial applications as well. Not all of the non-military applications are mature; some are still under development.

Examples of non-military end product applications based on IR-FPAs include:

- Personal/industrial security for persistent surveillance
- Search and rescue
- Industrial/construction heat detection and failure analysis
- Gas leak detection such as CO2 or SF6 (Ex. FLIR GF300/320 http://www.flir.com/ogi/display/?id=55671 [attachment 01]) (Foreign ex. IR Nova: http://www.ir-nova.se/applications/gas-detectionindustrial/ [attachment 02])
- Medical research such as cancer/tumor detection (Ex. Skinfrared [attachment 03] http://skinfrared.com/research-divisions/infrared-imaging-division/)

In addition, there are non-FPA applications such as:

- Thermal photovoltaic (TPV),
- 2-4 um lasers such as Interband Cascade Laser (ICL [attachment 04] http://nanoplus.com/en/products/distributed-feedback-lasers/distributed-feedback-lasers-3000-nm-6000-nm/) and Type I bulk (http://brolis-semicon.com)

Furthermore, many of these controlled IR FPA products and their components are commercially available abroad from foreign companies such as SCD, Thales, BAE, Selex and IR-NOVA.

In note 2 to paragraph (c) uses the technical threshold of 640 detector elements. While that may be an acceptable current threshold indicating military use, it may not remain so in the future. There should be a mechanism in-place to amend this requirement as the technology landscape changes.

1250 E. Collins Blvd.
Richardson, TX 75081
(972) 234-0068

The trend over the past years has been for increasingly larger wafer sizes and more dual-use applications. For example, GaSb substrates with up to 4" in diameter are currently available from foreign supplier with Wafer Tech (a UK company) being the world leader—not a US company. Wafer Tech has recently demonstrated the capability to manufacture 7" diameter at the 2015 SPIE-DSS Conference in Baltimore (see attachment 05). The industry will continue to move towards larger detectors, including for dual-use applications.

From a broader perspective, we believe restricting IR FPA substrates would prevent US companies from effectively competing in the international marketplace while not effectively protecting US military interests. Unfortunately, the US isn't necessarily ahead of all foreign competitors especially in market share. As an example, for CdZnTe substrates, Nikko-Japan Energy is the industry leader. Additionally, these controls will encourage foreign competition while stifling the domestic semiconductor industry. For instance, there is no longer a domestic US manufacturing base for GaAs or InP substrate anymore. AXT (www.axt.com), a public US company that designs, develops, manufactures and distributes high-performance compound semiconductor substrates, has moved all of its manufacturing to China due to more competitive manufacturing cost structure. AXT was originally started with Vertical Gradient Freeze crystal pulling technology licensed from AT&T Bell Labs. AXT was also funded by Title III money.

The semiconductor industry is mature and extremely competitive. US export controls burdens US semiconductor companies with more conditions on foreign sales and longer and less predictable waiting periods for license approval than faced by foreign based companies. The extended waiting time and added complexity needed for responding to potential customers can impact the competitiveness of US companies even if export licenses are not denied.

II. Epi Materials

The development of improved epitaxial wafers (Epi-wafers) requires significant investments in research and development along with manufacturing infrastructure by Epi-wafer suppliers. Our foreign competitors have larger market share positions in worldwide epi-wafer production. For example, the 2014 IQE annual reports states that UK based IQE has 48% of the worldwide market share of for compound semiconductor wafers.[1] Taiwan based Visual Photonics Epitaxy (VPEC) and Landmark Optoelectronics Corporation has 18% and 10% market shares respectively. In contrast, smaller player such as IET and Epiworks have only about 5% worldwide market share apiece. The small market share positions of US based companies make it difficult for these companies to invest in the infrastructure needed to compete with these well-established foreign competitors. Restrictive export controls will further exacerbate the competitive challenges faced by US companies in this industry. For a list of non-US sources with epi capabilities, please see the attached spreadsheet (attachment 06).

An example of a foreign HOT-MW FPA/camera product that exceeds USML technical parameters in note 2 to paragraph (c) is the SCD HOT Hercules with a 1280x1024 FPA format with 15 micron pitch (see attachment 07 or http://www.scd.co.il/HOT-HERCULES-1280-15). SCD produces its own epi in Israel. In fact, some of the initial development of this work was funded by DARPA (http://www.semiconductor-today.com/news_items/2008/AUGUST/SCD_130808.htm). As

example if we are restricted to supply epi wafers to them based on their own IP then this will likely encourage them to develop their own additional manufacturing capability themselves without further reliance on US manufacturing capability.

III. Conclusions

We conclude that the current language for the above mentioned entries would be overly restrictive, controlling products with dual-use applications while failing to achieve the goals of the ECR guideline. Furthermore, it is our belief that the current language is trying to protect too much, which will diminish the government's ability to focus efforts on the most critical national security priorities. IET also supports the potential conclusion that the USML should align with the Wassenaar Munitions List.

If you require any further information, please contact me at 972-814-6050 or via email at pinsu@intelliepi.com.

Sincerely,

Paul Pinsukanjana

FLIR GF300/320 Infrared Cameras

For Gas Leak Detection and Electrical Inspections

The FLIR GF300/320 infrared camera is a preventative maintenance solution to spot leaks in piping, flanges and connections in petrochemical operations. The infrared camera can rapidly scan large areas and pinpoint leaks in real time. It is ideal for monitoring plants that are difficult to reach with contact measurement tools.

Literally thousands of components can be scanned per shift without the need to interrupt the process. It reduces repair downtime and provides verification of the process. Above all it is exceptionally safe, allowing potentially dangerous leaks to be monitored from several meters away. FLIR GF300/320 will significantly improve your work safety, environmental and regulatory compliance, not to mention helping to improve the bottom line by finding leaks that essentially decrease profits. The new GF300/320 now embeds GPS data into the image allowing workers to pinpoint the location of the leak or hot spot.

Key Features

- Visualize gas leaks in real time
- Fully calibrated for temperature measurement applications
- Embedded GPS data in reporting
- Inspect without interruption of process
- Considerably reduce inspection time
- Trace leaks to source
- Spot leaks close by or meters away
- Verification of repair

Makes Reporting Easy

Images from FLIR GF-Series infrared cameras are recordable to any off-the-shelf video recorder for easy archiving and documentation.

Rotatable flip out screen makes it possible to inspect hard to reach places

The Infrared Market

The infrared imaging business comprises two main markets: Lower cost, higher volume devices, and high cost, low volume devices.

The first category is most often represented by bolometers, which operate at room temperature and provide relatively simple information. The end user of the bolometer device is often a consumer, for instance in the case of a vehicle with a thermal imager on the dashboard to aide in identifying road hazards. By 2017, these devices are projected to cost less than $1,000, similar to the cost of a GPS unit a decade ago.

Bolometer devices are not sufficiently sensitive for the second category of infrared imaging. The second category includes a wide variety of uses in highly specialized industrial, military, and medical devices.

The sensors we are developing are faster, cooled, Type II Superlattice detectors, purpose built for their applications. Our devices are uniquely suited to the particular situation for which we manufacture them, and fine tuned to generate the necessary specific imaging results.

Strategic Partners

Raytheon

Our biggest strategic partner is Raytheon Vision Systems, but we work closely with a variety of partners in industrial consortium. We are also funded through a combination of government and private sources.

Our Technology

We are involved with the development of next-gen infrared imagers and can fabricate test diodes with 320×256 focal plane arrays as well as 640×512 fpa imagers using Type II strained layer superlattices.

This technology has demonstrated dramatic improvement in device performance in the past few years.

The SLS technology consists of hundreds of periods of very thin layers of two different semiconductors. Specifically, InAs and GaSb are deposited one after the other. This idea was first proposed by Nobel Laureate, Leo Esaki, in the early 70's. However, the technology did not exist to actually realize these highly precise nanostructures in the laboratory.

In the past decade, there has been a dramatic improvement in the performance of infrared imagers based on these superlattices. The superlattices have been identified as a leading technology for the development of next generation infrared imagers by the Department of Defense. They have a large quantum efficiency and high sensitivity in the mid wave infrared (3-5µm) and long wave infrared (8-12µm).

We have access to "Epi to Camera" research for realizing these detector technologies. This involves heterostructure design and engineering, crystal growth using molecular beam epitaxy, materials characterization, single and focal plane array fabrication, hybridization and radiometric characterization as shown.

Distributed Feedback Lasers: 3000 nm - 6000 nm

nanoplus offers DFB interband cascade lasers at any wavelength between 3000 nm and 6000 nm.

Prism Award Winners 2012

PRISM AWARDS WINNER

nanoplus DFB interband cascade lasers (ICLs) won the "Prism Award for Green Photonics and Sustainable Energy" in 2012. They cover the entire wavelength range from 3000 nm to 6000 nm. Many prominent gas species have their strongest absorption features in this window. They are now accessible for tunable diode laser spectroscopy in industry and research. SPIE and Photonics Media honored the laser development in a ceremony during Photonics West in San Francisco.

Key features of nanoplus DFB interband cascade lasers

- monomode
- continuous wave
- room temperature
- low power consumption
- tunable
- custom wavelengths

Why choose nanoplus DFB interband cascade lasers

- stable longitudinal and transversal single mode emission
- precise selection of target wavelength
- narrow laser line width
- mode-hop-free wavelength tunability
- fast wavelength tuning
- typically > 5 mW output power
- small size
- easy usability
- high efficiency
- long-term stability

For more than 15 years nanoplus has been the technology leader for lasers in gas sensing. We produce lasers at large scale at our own fabrication sites in Gerbrunn and Meiningen. nanoplus cooperates with the leading system integrators in the TDLAS based analyzer industry. More than 15,000 installations worldwide prove the reliability of nanoplus lasers.

Quick description of nanoplus DFB laser technology

nanoplus uses a unique and patented technology for DFB laser manufacturing. We apply a lateral metal grating along the ridge waveguide, which is independent of the material system. Read more about our patented distributed feedback technology.

Related information for nanoplus DFB interband cascade lasers between 3000 nm and 6000 nm

Specifications | Mountings & Accessories | Applications | Papers & Links

The following table summarizes the typical DFB laser specifications in the 3000 nm to 6000 nm range:

parameters	symbol	unit	minimum	typical	maximum
wavelength precision	δ	nm		0.1	
optical output power	P_{out}	mW		> 1

SPIE is the international society for optics and photonics, a not-for-profit organization founded in 1955 to advanced light-based technologies. The Society serves nearly 225,000 constituents from approximately 150 countries, offering conferences, continuing education, books, journals, and a digital library in support of interdisciplinary information exchange, professional growth, and patent precedent. SPIE provided $3.4 million in support of education and outreach programs in 2014.

SPIE Fellows Luncheon

12:00 to 1:30 pm

All SPIE Fellows are invited to join your colleagues for this fifth annual SPIE-hosted luncheon. The new Defense, Security, and Sensing Fellows will be introduced and receive their Fellow plaques. Please join us for this informal gathering and a chance to interact with other Fellows.

Fellows planning to attend are asked to RSVP to Brent Johnson.

Fellows Luncheon Presentation: **Dr. Michael Eismann,** The U.S. Air Force Research Laboratory

PANEL DISCUSSION

Issues and Challenges of the Applications of Context to Enhance Information Fusion

Conf. 9474 · 1:15 to 4:45 pm

Panel Organizers: **Erik Blasch,** Air Force Research Lab. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA)

Panel Moderators: **Ivan Kadar,** Interlink Sciences Systems, Inc. (USA); **Chee-Yee Chong,** Independent Consultant (USA)

Panel Members: **Erik Blasch,** Air Force Research Lab. (USA); **Alex L. Chan,** U.S. Army Research Lab. (USA); **Chee-Yee Chong,** Independent Consultant (USA); **Laurie H. Fenstermacher,** Air Force Research Lab. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Ronald P. S. Mahler,** Consultant (USA); **Alan N. Steinberg,** Independent Consultant (USA); **Paul Tandy,** Defense Threat Reduction Agency (USA); **Shanchieh Jay Yang,** Rochester Institute of Technology (USA)

For a given application contextual information represents prior domain knowledge about the setting of the scenario/process to commence. The contextual knowledge can be acquired from prior (historical) experience, provided by external sources (e.g., user), learned from process experience, e.g., context awareness, prediction and search; and can be updated/corrected if changes are detected, e.g., by machine learning.

Context is present in all aspects of processing and interpreting information, situation, data, text, imagery, target tracking/identification, web-analytics, and intelligence systems outputs, that is, in all aspects/levels of information fusion (IF). Context is a multi-faceted entity, and can represent a setting for the assessment/interpretation of an event, scene, presence, situation, condition, constraint, influence, and many other entities clearly scenario/application dependent. There is context within context. Furthermore, context is not a static entity and can change over time (e.g., operating conditions, environment, geography, weather, seasons, roads, traffic, attitudes, behavior, preferences) affecting the performance of a given application if not managed and taken into account. Therefore, it is important to incorporate contextual information at the outset in all IF levels and associated systems designs in order to enhance the performance of the overall IF system and the on-going application.

For example in tracking application one can describe at least five contextual categories: (1) domain knowledge from a user to aid the information fusion process through selection, cueing, and analysis, (2) environment-to-hardware processing for sensor management, (3) known distribution of entities for situation/threat assessment, (4) historical traffic behavior for situation awareness patterns of life (POL), and (5) road information for target tracking and identification. Appropriate characterization and representation of contextual information is needed for future high-level information fusion systems design to take advantage of the large data content available for a priori knowledge target tracking algorithm construction, implementation, and application.

The objective of this panel is to bring to the attention of the fusion community the importance of the application of contextual knowledge to enhance IF, highlighting issues, illustrating potential approaches and addressing challenges. A number of invited experts will discuss challenges of the fusion process and research to address these challenges. The panelists will illustrate parts of the above mentioned areas over different applications and address all levels of information fusion. Conceptual and real-world related examples associated with the use of context to enhance IF will be used by the panel to highlight impending issues and challenges.

PANEL DISCUSSION

Metrology for Additive Manufacturing

Conf. 9489 · 2:10 to 3:30 pm

Moderator: **Edward W. (Ted) Reutzel,** Applied Research Lab. (USA)

Panelists: **Doug Rhoda,** Wolf Robotics (USA), **Radovan Kovacevic,** Southern Methodist Univ. (USA), **Shawn Kelly,** Edison Welding Institute (USA), **Jyoti Mazumder,** Univ. of Michigan (USA), **Edward Herderick,** GE Corporate (USA)

Process sensing plays an increasingly important role in a wide range of manufacturing processes, both to enable rapid assessment of quality and to provide critical data to real time control systems. Advanced sensors and exploding computational capability afford (i) practitioners, (ii) equipment suppliers, and (iii) researchers unprecedented opportunities to collect and analyze complex sensor data to ensure quality product.

This panel discussion brings together leaders representing these three communities to discuss sensing and control for laser, electron beam, and arc-based welding, metal deposition, and additive manufacturing processes. The current state-of-the-art, current research, issues, and opportunities will be explored.

The Infrared Applications: ThermoSense XXXVII Vendor Session

Conf. 9485 · 1:00 to 5:00 pm

Moderators: **Andrés E. Rozlosnik,** SI Termografia Infrarroja (Argentina), and **Herb Kaplan,** Honeyhill Technical Co. (USA)

The Infrared Applications: ThermoSense XXXVII Vendor Session will be held on Monday afternoon, 20 April 2015 as part of the SPIE DSS 2015 Conference in Baltimore. The session will feature brief presentations from hardware and software vendors whose product lines impact thermal imaging applications. Unlike the technical sessions, there are no "commercial content" restrictions in these presentations.

This event allows vendors to showcase new products on display at this year's exhibit, and provides attendees with an advance glimpse of "what's new" in thermal imaging applications.

If you are interested in participating or have any questions, please contact: Vendors Session 2015 Moderators Herb Kaplan, or Andres Rozlosnik: hkaplan@earthlink.net or aer@termografia.com

Plenary Presentation

5:00 to 6:00 pm

Alan R. Shaffer

Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Mr. Shaffer is currently serving as the Acting Assistant Secretary of Defense Research and Engineering. He also serves as the Principal Deputy Assistant Secretary of Defense Research and Engineering, a position he has held since 2007. In this position, Mr. Shaffer is responsible for formulating, planning, and reviewing the DoD Research, Development, Test, and Evaluation (RDT&E) programs, plans, strategy, priorities, and execution of the DoD RDT&E budget that totals roughly $25 billion per year. He has also serviced twice as the Acting Director of Defense Research and Engineering, currently titled the Assistant Secretary of Defense (Research and Engineering), first from 2007 to 2009 and then again from 2012 to 2013. Additionally, in 2009, he was appointed as the first Director, Operational Energy, Plans and Programs (Acting). Mr. Shaffer has also served as the Executive Director for several senior DoD Task Forces. In 2005 he served as the Executive Director for the Technical Joint Cross Service Group that reviewed the 300 DoD research, acquisition and test activities during the Base Realignment and Closure activity. In 2007, he was the Executive Director for the DoD Energy Security Task Force, which led to the establishment of a congressionally confirmed position to focus on DoD operational energy use. Most recently, he served as the Executive Director of the Mine Resistant Ambush Protection (MRAP) Task Force, which he was responsible for fielding 27,000 MRAPs.

Prior to entering the federal government, Mr. Shaffer served a 24-year United States Air Force career with assignments in weather, intelligence, acquisition oversight, and programming.

Welcome Reception

6:15 to 7:45 pm

All-Symposium Welcome Reception
Maryland Science Center

All attendees are invited. Relax, socialize, and enjoy the refreshments and all that the museum has to offer. Located in Baltimore's Inner Harbor, it is a short walk from the convention center and one of the harbor's main attractions, serving more than half a million visitors per year. Please remember to wear your registration badge. Dress is casual.

Tuesday 21 April.

Lunch with the Experts - A Student Networking Event

12:30 to 1:30 pm
Open to Student Attendees

Enjoy a casual meal with colleagues at this engaging networking opportunity. Hosted by SPIE Student Services, this event features experts willing to share their experience and wisdom on career paths in optics and photonics.

PANEL DISCUSSION

Anticipative Computing for Autonomous Sensing and Analytics: What is over the horizon?

Conf. 9473 · 1:20 to 3:00 pm

Moderator: **Kannappan Palaniappan,** Univ. of Missouri-Columbus (USA)

With the recent advances in novel sensors and agile platforms for airborne and satellite-based urban mapping, deep learning, neuromorphic architectures, power efficient computing, encrypted sensor networks and highly compact cloud-based storage, the prospect for persistent sensing without sustained continuous reach-back seems to be within reach. Are we ready for autonomy at the edge? What is the critical role of anticipative computing, global autonomous mapping and decision making? One can expect the development of fluid evasive behavior by mobile targets in this context? How should autonomy tasks be formulated in such scenarios? What context-based and scene adaptive video processing, bi-directional information flows and video analytic elements with learning do we want to provide to enable anticipative analytics at the edge? What are the benefits we want autonomous computing to provide to systems operating at the edge?

Charting a Course in the Photonics Industry

3:00 to 5:00 pm

Shape yourself for a future in photonics. This speaker series will help you explore potential career pathways in the world of photonics outside of academia. Get solid advice on how you can translate your knowledge, abilities, and interests into meaningful work. Whether you work for an existing company or start your own, getting a clear picture of the options from experienced leaders will help you better manage your career trajectory. The series will conclude with a question-and-answer session (with all speakers) and a light refreshment reception.

Next Generation Analytics Panel of Experts Discussion

Conf. 9499 · 3:30 to 5:00 pm

Moderator: **Barbara D. Broome,** U.S. Army Research Lab. (USA)

Speed Networking Social

5:00 to 6:30 pm

Open to All Attendees

Join us for the next generation of networking. Add a new contact to your network every three minutes while enjoying appetizers at the Pratt Street Ale House. Bring plenty of business cards, practice your pitch, and expand your network.

Interactive Evening Poster Session

6:00 to 7:30 pm

Location: Conv. Ctr. Mezzanine

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Wednesday 22 April.

Concepts for Accelerating Innovation: Redefining the Research Eco-System

3:30 to 5:00 pm

Pellegrino

Russell

This panel discussion will outline and explore novel methods through which research and development collaborations are being arranged to better address the increasing pace of technological change, the globalization of technology, and the need to re-energize University/Industry/Government laboratory synergies.

Moderator: **Dr. John Pellegrino,** Director, Computational and Information Sciences Directorate, US Army Research Laboratory (ARL).

Panel participants from Industry, Government and Academia will include, among others:

Dr. Thomas Russell, Director, ARL, who will describe ARL's newly established Open Campus initiative.

Dr. Nicholas Colaneri, Director, Arizona State University Flexible Electronics & Display Center, who will discuss the Center's progressive Industry Partnership initiatives.

Hyperspectral Imaging Standards Workshop

4:30 to 6:00 pm

Workshop Chair: **David Allen,** National Institute of Standards and Technology (USA)

PURPOSE: Hyperspectral imaging as a field is in the process of maturing from a specialized tool to a routine method applied to many facets of society. Standards provide common reference points that foster an understanding between different entities. This meeting is intended to survey the range of standards currently available and to identify gaps where new standards are needed. The range of standards open for discussion encompass all aspects related to hyperspectral imaging and may include performance specifications, calibration standards, data formats, terminology, and best practices. This workshop will provide an open forum for metrology laboratories, instrument vendors, data product analysts, data product vendors, and end-users. The outcome of this meeting will provide guidance for future activities including an expanded workshop to address areas determined to be significant bottlenecks restricting the full potential of this field. This meeting is open to all DSS registered attendees.

GOALS:
- Provide a forum for the hyperspectral imaging community to discuss current and needed standards
- Identifying international standards organizations that are the most logical homes for new standards
- Address the need for standards to address regulatory requirements
- Discuss the possibility of a uniform set of performance metrics Discuss the need for traceability to national standards
- Consider formalizing best practices.

Thursday 23 April.

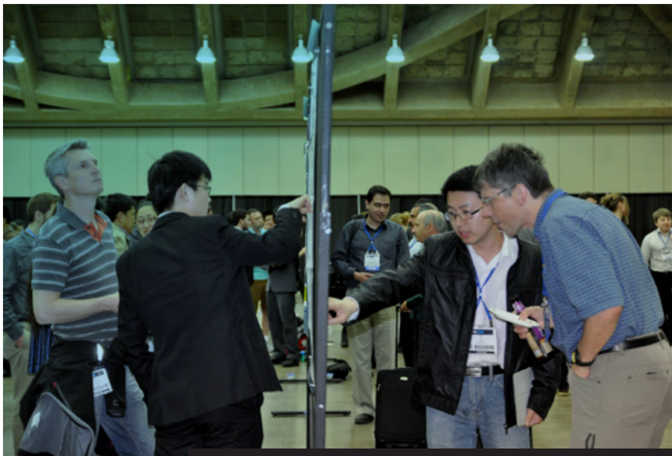
Interactive Evening Poster Session

6:00 to 7:30 pm

Open to All symposium attendees

You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.



INDUSTRY EVENTS

Explore the business side of DSS 2015. These important events and sessions will provide valuable information and networking opportunities needed to succeed in business. See the event website for full session descriptions and schedule.

FREE - Open to all conference attendees, exhibitors, and exhibition visitors.

PANELS

Interactive discussions on some of the biggest challenges and most promising areas of our industry.

- Sensing, Imaging, and Vision in the Pharmaceutical Industry
- The Future of Sensing — An Industry Perspective
- Getting Hired in 2015 and Beyond

SPECIAL EVENTS

Important networking events for the business community.

- The Infrared Applications: ThermoSense Vendor Session
- Keynote Presentation: National Network for Manufacturing Innovation (NNMI) Update
- Keynote Presentation: Funding Update
- Roundtable Discussion: US Munitions List Category XII Proposed Rule Changes
- ITAR and Other International Trade Regulations
- Doing Business Globally: Legal Best Practices for Ensured Success
- Charting a Course in the Photonics Industry
- DARPA Research Interests in Microelectronics

WORKSHOPS

Learn essential skills for business.

- Early Stage Technology Commercialization by MIRTHE, Princeton Univ.
- TEDCO Workshop on Commercialization

JOB FAIR

Meet recruiters on the exhibit floor.

Job Fair 21 to 22 April

WORLD-CLASS EXHIBITION

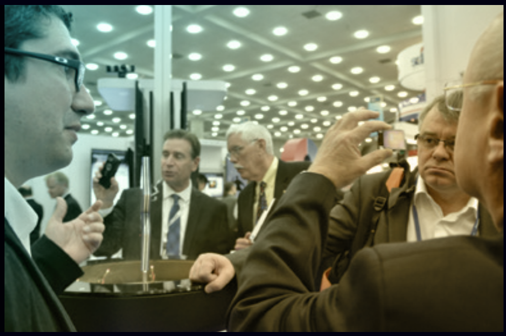
Meet the best suppliers face-to-face.

- **DSS EXPO** 21 to 23 April

SEE WEB FOR UPDATES
www.spie.org/dss15program

E

EXHIBITION



The East Coast's largest optics and photonics exhibition

DSS EXPO

Save time and money by meeting with 450 suppliers from both symposia. Gather with a high concentration of companies sharing their newest products, latest innovations, and cutting-edge technologies. Also see the job fair, interactive technology displays, and more.

Featured Technologies:

- Cameras and CCD Components
- Chemical and Biological Analysis
- Defense, Security, Law Enforcement
- Detectors, Sensors
- Electronic Components and Digital Imaging
- Fiber Optic Components, Equipment, and Systems
- High-Speed Imaging and Sensing
- Industrial Sensing and Measurement
- Infrared Detectors and Systems
- Lasers and Other Light Sources, Laser Accessories, and Laser Systems
- LED, OLED, Non-laser Light Sources
- Machine Vision, Factory Automation
- Optical Coatings, Thin Films
- Optical Components – Lenses, Filters, Mirrors, Other
- Optical Design and Engineering
- Optics Manufacturing
- Robotics and Unmanned Systems
- Spectroscopy Devices and Equipment
- Structural and Infrastructure Sensing
- Test and Measurements, Metrology
- Vehicle Sensing and Control
- Emerging Photonics Technologies

EXHIBITION DATES AND HOURS

Tuesday 21 April · 10:00 am to 5:00 pm

Wednesday 22 April · 10:00 am to 5:00 pm

Thursday 23 April · 10:00 am to 2:00 pm

Don't miss additional opportunities to engage and network

NEW TECHNOLOGY DEMOS AND DISPLAYS

See innovations from our exhibitors in this special showcase. Get an up-close look at the latest in technologies—examples from last year include smartphone thermal imaging, high-dexterity manipulation systems, and 6 axis motion systems.

"SPIE has had a particular focus at times on applications and uses of photonics that I think has spurred a lot of great thought on how problems can be solved using photonics. Not just advancing the state of the art, but actually looking at the applications has been a great contribution that SPIE has made."

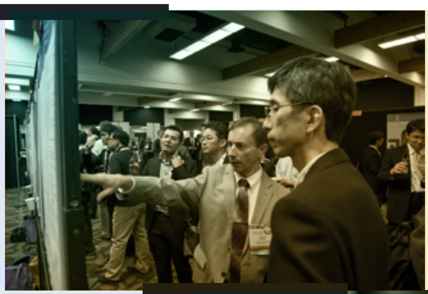
Help expand and develop commercial and industrial sensing technologies



We invite you to participate in SPIE Sensing Technology + Applications, a major symposium focused on commercial and industrial sensing technologies and applications.

The field of sensors, and in particular those with photonics-based capabilities, is rapidly expanding and offers a rich environment for the development and deployment of new technologies. Humans carry multiple sensors with them every day in their phones and portable devices, and sensors and sensor networks are used across the globe in almost every conceivable industry and application. The potential of leveraging real-time data produced from a global network of distributed sensors opens up a world of new opportunities.

SPIE Sensing Technology + Applications brings together the global community to learn about the newest technologies and how these are driving new applications in healthcare, industrial processing, manufacturing, communications, transportation, agriculture, the environment, and more. Participants in Sensing Technology + Applications will benefit from the meeting's co-location with SPIE Defense + Security, which features a rich array of photonics technologies already developed for dual-use applications.

We look forward to meeting with you in Baltimore and developing the next generation of sensing technologies and applications to improve life and benefit humankind.

Clausthal Univ. of Technology and Fraunhofer Heinrich-Hertz Institute (Germany)

Ming C. Wu, *Symposium Co-Chair*
Electrical Engineering & Computer Sciences, University of California, Berkeley (USA)

CONTENTS

BEST PAPER AND BEST STUDENT PAPER AWARDS

The list of awards for the Sensing Technology + Applications symposium may be updated as new awards are added.

Terahertz Physics, Devices, and Systems IX: Advanced Applications in Industry and Defense

(Conference 9483)

The Conference Chairs and Program Committee for the Terahertz Physics, Devices, and Systems IX: Advanced Applications in Industry and Defense conference would like to recognize pioneers in the field with a Best Paper Award. Two candidates will be selected: one winner for the Best Paper Award ($1,000 USD) and a Runner-up ($500 USD). This award is open to all authors who present in this conference. Please see next page for complete award eligibility requirements.

Thermosense: Thermal Infrared Applications XXXVII

(Conference 9485)

The Conference Chairs and Program Committee of the oldest and largest technical conference focused on thermal infrared applications are pleased to announce the addition of a Best Paper Award and Best Student Paper Award. Winners will be notified by email.

All papers submitted will be considered for the Best Paper Award and one paper will be selected.

Students who wish to be considered for the Best Student Paper Award must submit their paper for consideration. The Award Contact to submit papers for consideration is Dr. Sheng-Jen (Tony) Hsieh at hsieh@tamu.edu.

Please see next page for complete award eligibility requirements.

Smart Biomedical and Physiological Sensor Technology XII

(Conference 9487)

The Conference Chairs and Program Committee for the Smart Biomedical and Physiological Sensor Technology XII conference would like to recognize pioneers in the field with a Best Paper Award. Two candidates will be selected: one winner for the Best Paper Award ($1,000 USD) and a Runner-up ($500 USD). This award is open to all authors who present in this conference. Please see next page for complete award eligibility requirements.

Sensing for Agriculture and Food Quality and Safety VII

(Conference 9488)

The Conference Chairs and Program Committee for the Sensing for Agriculture and Food Quality and Safety VII conference would like to recognize pioneers in the field with a Best Paper Award. Two candidates will be selected: one winner for the Best Paper Award ($1,000 USD) and a Runner-up ($500 USD). This award is open to all authors who present in this conference. Please see next page for complete award eligibility requirements.

Advances in Global Health through Sensing Technologies 2015

(Conference 9490)

The Conference Chairs and Program Committee for the conference would like to recognize pioneers in the field with a Best Paper Award. Two candidates will be selected: one winner for the Best Paper Award ($1,000 USD) and a Runner-up ($500 USD). This award is open to all authors who present in this conference. Please see next page for complete award eligibility requirements.

Advanced Photon Counting Techniques IX

(Conference 9492)

The Conference Chair and Program Committee for the Advanced Photon Counting Techniques IX conference would like to recognize pioneers in the field with a Best Paper Award. Two candidates will be selected: one winner for the Best Paper Award ($1,000 USD) and a Runner-up ($500 USD). This award is open to all authors who present in this conference. Please see next page for complete award eligibility requirements.

Three-Dimensional Imaging, Visualization, and Display 2015

(Conference 9495)

The Fumio Okano Best 3D Paper Prize is sponsored by NHK-ES, and is presented annually in memory of Dr. Fumio Okano for his enduring contributions to the field of 3D TV and Display. Please see the conference website for additional information.

Independent Component Analyses, Compressive Sampling, Large Data Analyses (LDA), Neural Networks, Biosystems, and Nanoengineering XIII

(Conference 9496)

This conference features six awards in human sciences and engineering annually:

- Compressive Sensing
- Large Data Analyses
- ICA
- Nanoengineering
- Wellness Engineering
- System Biology

The nomination and selection procedure for these awards is done by the previous recipients, similar to other notable awards in science. Please see the Awards web page at http://www.ica-wavelet.org for history, a list of past recipients and additional information.

Machine Intelligence and Bio-inspired Computation: Theory and Applications IX

(Conference 9494B)

The Conference Chair and Program Committee for the Machine Intelligence and Bio-inspired Computation: Theory and Applications conference would like to recognize pioneers in the field with a Best Paper Award. All submitted papers will be considered, provided they meet the award eligibility requirements shown on the next page. Five winners will be selected and notified by email.

Mobile Multimedia/Image Processing, Security, and Applications 2015

(Conference 9497)

The Conference Chairs and Program Committee for the Mobile Multimedia/Image Processing, Security, and Applications conference would like to recognize pioneers in the field with a Best Paper Award. Eight candidates will be selected and notified by email. The candidate papers will be presented in a special session and one of the eight papers will be selected to receive the Best Paper Award. Please see next page for complete award eligibility requirements. Papers must choose "Nominate for Best Paper Award" as one of their topics during abstract submission in order to be considered.

AWARD ELIGIBILITY REQUIREMENTS

(excluding Conf. 9496)

BEST PAPER AWARDS

In order to be considered for a Best Paper Award:

- Presenter must make their oral or poster presentation as scheduled.
- Manuscript must be submitted to the Proceedings of SPIE. The award decision is based on manuscript submission.

Please see the conference award description and conference website to check for possible additional requirements.

BEST STUDENT PAPER AWARDS

In order to be considered for a Best Student Paper Award:

- Student must be the presenting author at the conference and must make their presentation as scheduled.
- Student must be the leading author of the manuscript and the manuscript must be submitted to the Proceedings of SPIE. The award decision is based on manuscript submission.
- Student must send a message to the designated Award Contact to submit their paper for consideration. This should be done after you have submitted your abstract, and must include your paper number and paper title. See the conference award listing for Award Contact information.

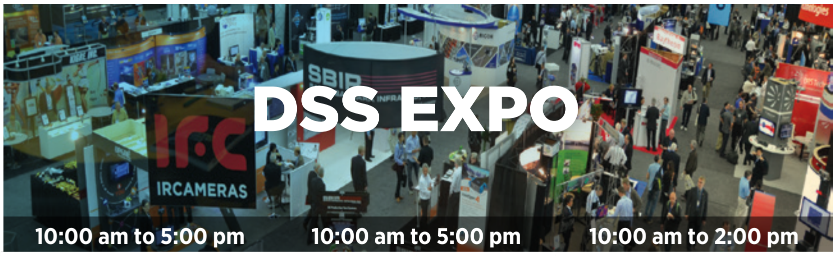
Please see the conference award description and conference website to check for possible additional requirements.

EVALUATION CRITERIA

A panel coordinated by the Conference Chairs will evaluate all papers submitted for consideration of high quality content. Attention may be given to 1) the innovation, clarity, and style of both the presentation at the conference and the manuscript submitted for publication, and 2) the importance of the work to the field.

DAILY CONFERENCE SCHEDULE

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
DSS 2015 SYMPOSIUM PLENARY PRESENTATION Monday 20 April 2015 · 5:00 to 6:00 pm **Alan R. Shaffer,** Principal Deputy Assistant Secretary of Defense Research and Engineering, Department of Defense	DSS EXPO 10:00 am to 5:00 pm	10:00 am to 5:00 pm	10:00 am to 2:00 pm	
WELCOME RECEPTION, 6:15 to 7:45 pm	**INTERACTIVE EVENING POSTER SESSION,** 6:00 to 7:30 pm	**DEDICATED EXHIBITION TIME,** 10:00 am to 1:00 pm	**INTERACTIVE EVENING POSTER SESSION,** 6:00 to 7:30 pm	



Imaging and Sensing Technologies

9480 **Fiber Optic Sensors and Applications XII** (Pickrell, Udd, Du)

9481 **Image Sensing Technologies: Materials, Devices, Systems, and Applications II** (Dhar, Dutta)

9482 **Next-Generation Spectroscopic Technologies VIII** (Druy, Crocombe)

9483 **Terahertz Physics, Devices, and Systems IX: Advanced Applications in Industry and Defense** (Anwar, Crowe, Manzur)

9484 **Compressive Sensing IV** (Ahmad)

Sensing for Industry, Environment, and Health

9485 **Thermosense: Thermal Infrared Applications XXXVII** (Hsieh)

9486 **Advanced Environmental, Chemical, and Biological Sensing Technologies XII** (Vo-Dinh, Lieberman, Gauglitz)

9487 **Smart Biomedical and Physiological Sensor Technology XII** (Cullum, McLamore)

9489 **Dimensional Optical Metrology and Inspection for Practical Applications IV** (Harding, Yoshizawa)

9488 **Sensing for Agriculture and Food Quality and Safety VII** (Kim, Chao, Chin)

9490 **Advances in Global Health through Sensing Technologies 2015** (Southern)

9491 **Sensors for Extreme Harsh Environments II** (Senesky, Dekate)

THIS PROGRAM IS CURRENT AS OF DECEMBER 2014

9499 **Next-Generation Analyst III** (Broome, Hanratty, Hall, Llinas)	9499 (continued)		9501 **Satellite Data Compression, Communications, and Processing XI** (Huang, Chang)	9501 (continued)

CONFERENCE 9480

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9480

Fiber Optic Sensors and Applications XII

Conference Chairs: **Gary Pickrell,** Virginia Polytechnic Institute and State Univ. (USA); **Eric Udd,** Columbia Gorge Research (USA); **Henry H. Du,** Stevens Institute of Technology (USA)

Conference Co-Chairs: **Christopher S. Baldwin,** Weatherford International Ltd. (USA); **Jerry J. Benterou,** Lawrence Livermore National Lab. (USA); **Anbo Wang,** Virginia Polytechnic Institute and State Univ. (USA)

Program Committee: **Ole Bang,** Technical Univ. of Denmark (Denmark); **Eric A. Bergles,** BaySpec Inc. (USA); **Jeff Bush,** Optiphase, Inc. (USA); **Kevin Peng Chen,** Univ. of Pittsburgh (USA); **Brian Culshaw,** Univ. of Strathclyde (United Kingdom); **Abdessama Elyamani,** Northrop Grumman Navigation Systems (USA); **Xudong Fan,** Univ. of Michigan (USA); **Yoel Fink,** Massachusetts Institute of Technology (USA); **Eric Lee Goldner,** US Sensor Systems, Inc. (USA); **Tom W. Graver,** Micron Optics, Inc. (USA); **Ming Han,** Univ. of Nebraska-Lincoln (USA); **Hajime Haneda,** National Institute for Materials Science (Japan); **Daniel Homa,** Virginia Polytechnic Institute and State Univ. (USA); **Kazuo Hotate,** The Univ. of Tokyo (Japan); **Jiri Kanka,** Institute of Photonics and Electronics of the ASCR, v.v.i. (Czech Republic); **Gurbinder Kaur,** Thapar Univ. (India); **Victor I. Kopp,** Chiral Photonics, Inc. (USA); **Katerina Krebber,** Bundesanstalt für Materialforschung und -prüfung (Germany); **Steven T. Kreger,** Luna Innovations Inc. (USA); **David A. Krohn,** Light Wave Venture Consulting, LLC (USA); **Paul Lefebvre,** LxDATA (Canada); **Alexis Mendez,** MCH Engineering LLC (USA); **Stephen J. Mihailov,** National Research Council Canada (Canada); **Thomas D. Monte,** KVH Industries, Inc. (USA); **Glen A. Sanders,** Honeywell Technology (USA); **Fei Tian,** Stevens Institute of Technology (USA); **Jasbinder S. Sanghera,** U.S. Naval Research Lab. (USA); **Dennis J. Trevor,** OFS Labs. (USA); **Xingwei Wang,** Univ. of Massachusetts Lowell (USA); **Reinhardt Willsch,** Institut für Photonische Technologien e.V. (Germany); **Hai Xiao,** Clemson Univ. (USA); **Yizheng Zhu,** Virginia Polytechnic Institute and State Univ. (USA)

WEDNESDAY 22 APRIL

SESSION 1. . . . . WED 8:00 AM TO 10:00 AM

Bragg Grating I

Session Chair: **Gary Pickrell,**
Virginia Polytechnic Institute and State Univ. (USA)

Fiber optic sensors for structural monitoring: a 30 year perspective *(Invited Paper)*, Eric Udd, Columbia Gorge Research LLC (USA) . . . . [9480-1]

Fiber optic sensing goes mainstream *(Invited Paper)*, Tom W. Graver, Micron Optics, Inc. (USA) . . . . [9480-2]

Insight into fiber Bragg pressure sensor response at 100 MHz interrogation rates under various dynamic loading conditions *(Invited Paper)*, George Rodriguez, Los Alamos National Lab. (USA) . . . . [9480-3]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 2 . . . . WED 1:00 PM TO 2:00 PM

Bragg Grating II

Session Chair: **Gary Pickrell,**
Virginia Polytechnic Institute and State Univ. (USA)

Distributed Rayleigh scatter dynamic strain sensing above the scan rate with optical frequency domain reflectometry, Stephen T. Kreger, Justin Klein, Joseph J. Bos, Nur Aida Abdul Rahim, Luna Innovations Inc. (USA) . . . . [9480-4]

Interrogating adhesion using fiber Bragg grating sensing technology, Roger D. Rasberry, Garth D. Rohr, William K. Miller, Sandia National Labs. (USA); Eric Udd, Columbia Gorge Research LLC (USA); Noah T. Blach, U.S. Air Force Academy (USA); Ryan A. Davis, David Calkins, R. Allen Roach, David S. Walsh, James R. McElhanon, Sandia National Labs. (USA). . . . . [9480-5]

Residual internal stress optimization for EPON 828/DEA thermoset resin using fiber Bragg grating sensors, Garth D. Rohr, Amy L. Kaczmarowski, Mark Stavig, Cory Gibson, Sandia National Labs. (USA); Eric Udd, Columbia Gorge Research LLC (USA); R. Allen Roach, Rex Jaramillo, Roger D. Rasberry, Sandia National Labs. (USA) . . . . [9480-6]

SESSION 3 . . . . WED 2:00 PM TO 3:00 PM

Bragg Grating III

Session Chair: **Eric Udd,** Columbia Gorge Research LLC (USA)

Influence of dynamic thermal effects on durability of optical fiber in the fiber-optic temperature sensor, Alexandre V. Polyakov, Belarusian State Univ. (Belarus). . . . . [9480-7]

Fiber optic anemometer based on silicon Fabry-Perot interferometer, Ming Han, Guigen Liu, Univ. of Nebraska-Lincoln (USA); Weilin W. Hou, U.S. Naval Research Lab. (USA) . . . . [9480-8]

High-resolution wavelength shift detection of optical signals with low-cost, compact readouts, Peter Kiesel, Alex Hegyi, Ajay Raghavan, Alexander Lochbaum, Julian Schwartz, Bhaskar Saha, Anurag Ganguli, Kyle Arakaki, PARC, a Xerox Co. (USA) . . . . [9480-9]

SESSION 4 . . . . WED 3:30 PM TO 5:50 PM

Oil and Gas Applications

Session Chair: **Henry H. Du,** Stevens Institute of Technology (USA)

Novel sensing materials for harsh environment subsurface chemical sensing applications *(Invited Paper),* Paul R. Ohodnicki, Thomas Brown, Congjun Wang, Xin Su, National Energy Technology Lab. (USA) . . . . . . [9480-42]

Applications for fiber optic sensing in the upstream oil and gas industry, Christopher S. Baldwin, Weatherford International Ltd. (USA) . . . . [9480-10]

Operational verification of a blow out preventer (BOP) utilizing fiber Bragg grating based strain gauges, Alan Turner, Dan Thibodeau, Philippe Loustau, Lloyd's Register Energy-Drilling (USA) . . . . [9480-11]

Optical fiber sensor based on Mach-Zehnder interferometer for monitoring CO2 in carbon sequestration application, Luis B. Melo, Geoff Burton, Peter Wild, Univ. of Victoria (Canada). . . . . [9480-12]

Adapting long gauge vibrofibre to measure fracking activities down well for successful oil and gas exploration and production, Peter Kung, QPS Photronics Inc. (Canada); Maria I. Comanici, McGill Univ. (Canada) . . . [9480-13]

Sub-Hz C-band diode laser for oil exploration, Wei Liang, Vladimir S. Ilchenko, Elijah B. Dale, Danny Eliyahu, Anatoliy A. Savchenkov, Andrey B. Matsko, David J. Seidel, Lute Maleki, OEwaves, Inc. (USA). . . . . [9480-14]

THIS PROGRAM IS CURRENT AS OF DECEMBER 2014

THURSDAY 23 APRIL

SESSION 5 . . . . THU 8:00 AM TO 10:00 AM

Specialty Fiber Sensors I

Session Chair: **Ming Han,** Univ. of Nebraska-Lincoln (USA)

Specialty fiber optic applications for harsh and high radiation environments *(Invited Paper)*, Brian G. Risch, Prysmian Group (USA) . . . . [9480-15]

A polarization maintaining fiber optimized for high temperature gyroscopes, Andy M. Gillooly, Judith Hankey, Frank Tutu, Fibercore Ltd. (United Kingdom). . . . . [9480-16]

Compression of quantum data using compressed sensing, Marcin Kowalski, Marek Zyczkowski, M. Karol, Military Univ. of Technology (Poland) . . . [9480-17]

A miniature turn-around for distributed temperature sensing, Xiaoguang Sun, David T. Burgess, Kyle Bedard, Jie Li, Mike Hines, OFS (USA) . . . [9480-18]

Biomimetic optical sensor for aerospace applications, Susan A. Frost, NASA Ames Research Ctr. (USA); Cameron H. G. Wright, Steven F. Barrett, Univ. of Wyoming (USA) . . . . [9480-19]

SESSION 6 . . . . THU 10:30 AM TO 11:50 AM

Specialty Fibers II

Session Chair: **Tom W. Graver,** Micron Optics, Inc. (USA)

Multicore fiber strain sensor with increased sensitivity, Amy Van Newkirk, Jose E. Antonio-López, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Guillermo Salceda-Delgado, Ctr. de Investigaciones en Óptica, A.C. (Mexico); Mohammad Umar Piracha, FAZ Technology Research Inc. (USA); Rodrigo Amezcua-Correa, Axel Schülzgen, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA). . . . . [9480-20]

Few-mode fiber based sensor in biomedical application, Jing Zhang, A*STAR National Metrology Ctr. (Singapore) . . . . [9480-21]

Applying a correlation algorithm to a microring resonator based wavelength shift demodulator, German Vargas, Escuela Superior Politécnica del Litoral (Ecuador) . . . . [9480-22]

Nanostructured sapphire fiber for high temperature chemical sensing, Hui Chen, Fei Tian, Stevens Institute of Technology (USA); Jiri Kanka, Institute of Photonics and Electronics of the ASCR, v.v.i. (Czech Republic); Henry H. Du, Stevens Institute of Technology (USA) . . . . [9480-23]

Lunch Break and Exhibition Time . . . . Thu 11:50 am to 1:20 pm

SESSION 7 . . . . THU 1:20 PM TO 2:40 PM

Special Topics I

Session Chair: **Fei Tian,** Stevens Institute of Technology (USA)

In-line fiber optic sensors for absolute measurement of high temperature using gas as sensing element *(Invited Paper)*, Ming Han, Univ. of Nebraska-Lincoln (USA). . . . . [9480-24]

Optimization of detonation velocity measurements using a chirped fiber Bragg grating, Yohan Barbarin, Alexandre S. Lefrançois, Jérôme Luc, Guillaume Zaniolo, Vincent Chuzeville, Laurent Jacquet, CEA Gramat (France); Sylvain Magne, CEA LIST (France); Antoine Osmont, CEA Gramat (France) . . . . [9480-25]

High electric field measurement using slab coupled optical sensors, Nikola Stan, Richard H. Selfridge, Stephen M. Schultz, Brigham Young Univ. (USA) . . . . [9480-26]

Development of the wide field and high density type of bundle fiber for in vivo micro-imaging of bioluminescence, Yoriko Ando, Takashi Sakurai, Kowa Koida, Toyohashi Univ. of Technology (Japan); Mitsuo Natsume, Denkosha Co., Ltd. (Japan); Rika Numano, Toyohashi Univ. of Technology (Japan) . . . [9480-27]

SESSION 8 . . . . THU 2:40 PM TO 5:20 PM

Special Topics II

Session Chair: **George Rodriguez,** Los Alamos National Lab. (USA)

Measurements of UV-A radiation and hazard limits from some types of outdoor lamps, Essam Elmoghazy, National Institute For Standards (Egypt) . . . . [9480-28]

Real-time distributed DAS and DTS optical sensing advantages and data compression techniques for the application of hydraulic fracture monitoring, Peter Hayward, Deep Desai, Ifie Nyerhovwo, Fotech Solutions Ltd. (United Kingdom). . . . . [9480-29]

Near-infrared absorption fiber optic sensors for ultra-sensitive CO_2 detection, Xinyuan Chong, Ki-Joong Kim, Oregon State Univ. (USA); Paul R. Ohodnicki, National Energy Technology Lab. (USA); Chih-Hung Chang, Alan X. Wang, Oregon State Univ. (USA) . . . . [9480-30]

A fiber-optic current sensor for lightning measurement applications, Truong X. Nguyen, Jay J. Ely, George N. Szatkowski, NASA Langley Research Ctr. (USA). . . . . [9480-31]

High frequency strain measurements with fiber Bragg grating sensors, Jan Koch, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) and Clausthal Univ. of Technology (Germany); Martin Angelmahr, Wolfgang Schade, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) . . . . [9480-32]

Fiber-optical sensors for enhanced battery safety, Jan Meyer, Antonio Nedjalkov, Technische Univ. Clausthal (Germany); Alexander Doering, Martin Angelmahr, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany); Wolfgang Schade, Technische Univ. Clausthal (Germany) and Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) . . . . [9480-33]

New design for a wavelength demultiplexing device, Konrad Bethmann, Elke Pichler, Technische Univ. Clausthal (Germany); Urs Zywietz, Laser Zentrum Hannover e.V. (Germany); Thomas Schimdt, Uwe Gleissner, Univ. of Freiburg (Germany); Ulrike Willer, Technische Univ. Clausthal (Germany); Wolfgang Schade, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) and Technische Univ. Clausthal (Germany). . . . . [9480-34]

Femtosecond laser processing of evanescence field coupled waveguides in single mode glass fibers for optical 3D shape sensing and navigation, Christian Waltermann, Anna Lena Baumann, Martin Angelmahr, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany); Wolfgang Schade, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) and Technische Univ. Clausthal (Germany). . . . . [9480-35]

CONFERENCE 9481

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9481

Image Sensing Technologies: Materials, Devices, Systems, and Applications II

Conference Chairs: **Nibir K. Dhar,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Achyut K. Dutta,** Banpil Photonics, Inc. (USA)

Program Committee: **Homayoon Ansari,** Jet Propulsion Lab. (USA); **Arvind I. D'Souza,** DRS Sensors & Targeting Systems, Inc. (USA); **Ravi Dutt,** Booz Allen Hamilton Inc. (USA); **Michael D. Gerhold,** U.S. Army Research Office (USA); **John E. Hubbs,** Ball Aerospace & Technologies Corp. (USA); **Nobuhiko P. Kobayashi,** Univ. of California, Santa Cruz (USA); **Sanjay Krishna,** The Univ. of New Mexico (USA); **Robert Olah,** Banpil Photonics, Inc. (USA); **Adam Piotrowski,** VIGO Systems S.A. (Poland); **Siva Sivananthan,** EPIR Technologies, Inc. (USA); **Krishna Swaminathan,** Intel Corp. (USA); **Rama Venkatasubramanian,** RTI International (USA); **Priyalal S. Wijewarnasuriya,** U.S. Army Research Lab. (USA)

WEDNESDAY 22 APRIL

OPENING REMARKS . . . . 1:00 PM TO 1:05 PM

Conference Chair: **Nibir K. Dhar,**
U.S. Army Night Vision & Electronic Sensors Directorate (USA)

SESSION 1. . . . . WED 1:05 PM TO 2:45 PM

Advanced Focal Plane Array Technologies

Session Chairs: **Nibir K. Dhar,**
U.S. Army Night Vision & Electronic Sensors Directorate (USA);
Achyut K. Dutta, Banpil Photonics, Inc. (USA)

Integration of optical functionality for image sensing through sub-wavelength geometry design *(Invited Paper)*, Peter B. Catrysse, Stanford Univ. (USA) . . . . [9481-1]

Interaction of two nano particle plasmons for sensor application, Naresh C. Das, U.S. Army Research Lab. (USA) . . . . [9481-2]

CMOS compatible silicon photonics for mid-IR optical sensing, Pao T. Lin, Massachusetts Institute of Technology (USA) . . . . [9481-3]

Development of high performance SWIR InGaAs focal plane array, Richie S. Nagi, Jeremy Bregman, Genki Mizuno, Robert Olah, Achyut K. Dutta, Banpil Photonics, Inc. (USA); Nibir K. Dhar, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9481-4]

Functionalized fluorescent silver nanoparticle surfaces for novel sensing and imaging techniques, Kyle M. Culhane, Kathrin Spendier, Anatoliy O. Pinchuk, Univ. of Colorado at Colorado Springs (USA) . . . . [9481-5]

SWIR photodetector development at Fraunhofer IAF, Frank Rutz, Philipp Kleinow, Rolf Aidam, Matthias Wauro, Lutz Kirste, Wolfgang Bronner, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany); Alexander Sieck, AIM INFRAROT-MODULE GmbH (Germany); Martin Walther, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany). . . . . [9481-6]

SESSION 2 . . . . WED 3:20 PM TO 4:45 PM

Novel Technologies for Imaging

Session Chairs: **Achyut K. Dutta,** Banpil Photonics, Inc. (USA);
Nibir K. Dhar, U.S. Army Night Vision &
Electronic Sensors Directorate (USA)

UV/VIS/NIR imaging technologies: challenges and opportunities *(Invited Paper)*, Rihito Kuroda, Shigetoshi Sugawa, Tohoku Univ. (Japan) . . . . . . [9481-7]

InAs1-xSbx nanopillar photodetectors on GaAs (111)b substrates, Chung Hong Hung, Nanopixel Technologies, LLC (USA); Pradeep N. Senanayake, Univ. of California, Los Angeles (USA); Wook-Jae Lee, Univ. of California, Davis (USA); Alan Farrell, Univ. of California, Los Angeles (USA); Baolai L. Liang, Integrated NanoMaterials Core Lab. (USA); Diana L. Huffaker, Univ. of California, Los Angeles (USA) . . . . [9481-8]

Improved optical resonance in mid-infrared GaAs-based modulating retro-reflectors, Gregory E Triplett, Stanley Ikpe, Univ of Missouri-Columbia (USA) . . . . [9481-9]

Germanium/zinc sulfite distributed Bragg reflectors for large size MOEMS Fabry-Perot interferometers, Julian L. Chee, EPIR Technologies, Inc. (USA); Neelam Gupta, U.S. Army Research Lab. (USA); Silviu Velicu, EPIR Technologies, Inc. (USA) . . . . [9481-10]

High NA, VIS+IR, and athermal low-light camera objective, Markus Lipp, Frank Saupe, Matthias Falk, Martin Forrer, FISBA OPTIK AG (Switzerland) . . . . [9481-11]

THURSDAY 23 APRIL

SESSION 3 . . . . THU 9:00 AM TO 10:00 AM

Imaging Systems and Applications

Session Chairs: **Nibir K. Dhar,**
U.S. Army Night Vision & Electronic Sensors Directorate (USA);
Achyut K. Dutta, Banpil Photonics, Inc. (USA)

Image sensor conversion gain determination in data constrained environment: blending temporal and spatial information for a mean-variance measurement, Blake C. Jacquot, Sean Maguire, Brett Bolla, The Aerospace Corp. (USA) . . . . [9481-12]

Advanced computational sensors technology, Charbel G. Rizk, Johns Hopkins Univ. Applied Physics Lab., LLC (USA). . . . . [9481-13]

360-degree scanning light scattering profiler (SLSP) to quantitatively characterize the front and back light scattering from intraocular lenses (IOLs), Bennett N. Walker, Robert H. James, Don Calogero M.D., Ilko K. Ilev, U.S. Food and Drug Administration (USA) . . . . [9481-14]

The application of machine learning in multi sensor image fusion for activity recognition of mobile device space, Asmaa H. Marhoubi, Eran A. Edirisinghe, Loughborough Univ. (United Kingdom) . . . . [9481-15]

SESSION 4 . . . . THU 10:40 AM TO 11:50 AM

Imaging Applications

Session Chair: **Achyut K. Dutta,** Banpil Photonics, Inc. (USA)

Uncooled LWIR imaging: applications and market analysis *(Invited Paper)*, Satomi Takasawa, Techno Systems Research Co., Ltd. (Japan) . . . . . . [9481-16]

Advanced illumination control algorithm in VHDL, Ricardo M. Sousa, AWAIBA Lda. (Portugal) and Univ. da Madeira (Portugal); Martin Wäny, Pedro Santos, AWAIBA Lda. (Portugal); Morgado Dias, Univ. da Madeira (Portugal) and Madeira Interactive Technologies Institute (Portugal) . . . . [9481-17]

How thermographic mapping can help with enhanced oil recovery, Eric Olsen, Aerial Thermal Imaging (USA) . . . . [9481-18]

Information content capabilities of very high resolution optical space imagery for updating GIS database, Mehmet Alkan, Yildiz Technical Univ. (Turkey); Gurcan Buyuksalih, Bimtas (Turkey); Karsten Jacobsen, Leibniz Univ. Hannover (Germany). . . . . [9481-19]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Aliasing removing of hyperspectral image based on fractal structure matching, Ran Wei, Ye Zhang, Junping Zhang, Harbin Institute of Technology (China) . . . . [9481-20]

A low noise low power 512x256 ROIC for extended wavelength InGaAs FPA, SongLei Huang, Shanghai Institute of Technical Physics (China) . [9481-21]

A telephoto camera system with shooting direction control by gaze detection, Daiki Teraya, Nagaoka Univ. of Technology (Japan) . . . . . . [9481-22]

Reconstruction the system PSF by using the sub pixel technique, Xiaofeng Su, Fansheng Chen, Shanghai Institute of Technical Physics (China) . . [9481-23]

A bionic multi-band polarimetric imaging system, Yong Liu, Jingxiang Yang, Yongqiang Zhao, Northwestern Polytechnical Univ. (China) . . . . [9481-24]

2D imaging of metallic samples by means of resonance frequency measurements, Roberta Guilizzoni, Univ. College London (United Kingdom) . . . . [9481-25]

Enhancing the quality of experience of a portable device by creating an illumination model based on the ambient light sensor readings, Asmaa H. Marhoubi, Helmut E. Bez, Eran A. Edirisinghe, Sara Saravi, Loughborough Univ. (United Kingdom) . . . . [9481-26]

Surface-enhanced Raman scattering on a chemically etched ZnSe surface, Syed K Islam, John Lombardi, Maria Tamargo, City College, City Univ. of New York (USA); Richard Moug, City College, City University of New York (CUNY) (USA) . . . . [9481-27]

Effect of high proton implantation on the device characteristics of InAlGaAs-capped InGaAs/GaAs quantum dot based infrared photodetectors, Sourabh Upadhyay, Arjun Mandal, Hemant J. Ghadi, Dinesh Pal, Indian Institute of Technology Bombay (India); Nagaraju B. V. Subrahmanyam, Pitamber Singh, Bhabha Atomic Research Ctr. (India); Subhananda Chakrabarti, Indian Institute of Technology Bombay (India) . . . . [9481-28]

A detail investigation on quaternary and ternary capped strain coupled quantum dots based infrared photodetectors and effect of rapid thermal annealing temperature, Subhananda Chakrabarti, Hemant J. Ghadi, Sourav Adhikary, Saikalash Shetty, Akshay Balgarkashi, Indian Institute of Technology Bombay (India) . . . . [9481-29]

Studies on abrupt and gradual heterostructured hole barriers in barrier enhanced InAs/GaSb superlattice long wavelength photodetectors, Yi Zhou, Jianxin Chen, Fangfang Wang, Zhicheng Xu, Li He, Shanghai Institute of Technical Physics (China) . . . . [9481-30]

Automated optical system alignment and low order wavefront sensing, Joyce Fang, Cornell Univ. (USA) . . . . [9481-31]

Fluorescence of quantum dots on e-beam patterned and DNA origami substrates, Timothy C. Corrigan, Matthew Kessinger, Ina Nikolli, Concord Univ. (USA); Michael L. Norton, David Neff, Marshall Univ. (USA) . . . . [9481-32]

Analysis for simplified optics coma effection on spectral image inversion of coded aperture spectral imager, Yangyang Liu, Qunbo Lv, Linlin Pei, Jianwei Wang, Academy of Opto-Electronics (China) . . . . [9481-33]

Random laser action in al nanoparticle/Rh6G-doped silica gel, Chao Yang, Guoying Feng, Hong Zhang, Jiayu Yi, Jiajia Yin, Shouhuan Zhou, Sichuan Univ. (China) . . . . [9481-34]

Maximum allowable low-frequency platform vibrations in high resolution satellite missions: challenges and look-up figures, Javad Haghshenas, Satellite Research Institute (Iran, Islamic Republic of) . . . . [9481-35]

Choosing the right video interface for military vision systems, Edward Goffin, John Phillips, Pleora Technologies Inc. (Canada) . . . . [9481-36]

Nanomolecular gas sensor architectures based on functionalized carbon nanotubes for vapor detection, Deon Hines, The City College of New York (USA) . . . . [9481-37]

CONFERENCE 9482

Monday–Wednesday 20–22 April 2015 • Proceedings of SPIE Vol. 9482

Next-Generation Spectroscopic Technologies VIII

Conference Chairs: **Mark A. Druy,** (USA); **Richard A. Crocombe,** Thermo Fisher Scientific Inc. (USA); **David P. Bannon,** Headwall Photonics Inc. (USA)

Program Committee: **Leigh J. Bromley,** Daylight Solutions (USA); **John M. Dell,** The Univ. of Western Australia (Australia); **Richard D. Driver,** Headwall Photonics Inc. (USA); **Jason M. Eichenholz,** Open Photonics, Inc. (USA); **Michael B. Frish,** Physical Sciences Inc. (USA); **Fredrick G. Haibach,** BaySpec, Inc. (USA); **Willem Hoving,** Avantes B.V. (Netherlands); **Vassili Karanassios,** Univ. of Waterloo (Canada); **Martin Kraft,** Carinthian Tech Research AG (Austria); **Jouko O. Malinen,** VTT Technical Research Ctr. of Finland (Finland); **Curtis A. Marcott,** Light Light Solutions, LLC (USA); **Ellen V. Miseo,** Hamamatsu Corp. (USA); **Jeffry J. Santman,** Corning Advanced Optics (USA); **David W. Schiering,** Smiths Detection (USA); **John Seelenbinder,** Agilent Technologies (USA); **Ulrike Willer,** Technische Univ. Clausthal (Germany)

MONDAY 20 APRIL

SESSION 1. . . . . MON 8:00 AM TO 12:10 PM

Miniature, Portable and Handheld Instruments

Session Chair: **Mark A. Druy,** . (USA)

Development of handheld standoff Raman spectrometer for concealed chemical detection, Vincent Y. Lee, David W. Schiering, Smiths Detection Inc. (USA) . . . . [9482-1]

A perspective on the development of portable and hand-held Fourier transform infrared (FT-IR) spectrometers and their application *(Invited Paper)*, David W. Schiering, Josep Arnó, Smiths Detection Inc. (USA). . . [9482-2]

Chromium speciation using battery-operated microplasmas-on-chips and optical emission spectrometry, Jenisse German, Vassili Karanassios, Univ. of Waterloo (Canada). . . . . [9482-3]

Review and recent progress of handheld spectrometry at Thermo Fisher Scientific *(Invited Paper)*, Peidong Wang, Thermo Fisher Scientific Inc. (USA) . . . . [9482-4]

A new point of care device for the detection of transcutaneous bilirubin index based on a novel optical probe, Hasan B. Celebi, Yunus Karamavus, Yildiz Uludag, TÜBITAK National Research Institute of Electronics and Cryptology (Turkey) . . . . [9482-5]

A full featured handheld LIBS analyzer with early results for defense and security, David R. Day, Don Sackett, Brendan Connors, Morgan Jennings, SciAps, Inc. (USA) . . . . [9482-6]

Security and defense applications with a novel handheld mass spectrometer, Christopher D. Brown, 908 Devices Inc. (USA) . . . . [9482-7]

Towards a chip-scale integrated-optic TDLAS methane sensor, Michael B. Frish, Matthew C. Laderer, Physical Sciences Inc. (USA). . . . . [9482-8]

Interband cascade laser spectroscopic sources with extremely low power budgets, Jerry R. Meyer, Chul Soo Kim, U.S. Naval Research Lab. (USA); Mijin Kim, Sotera Defense Solutions, Inc. (USA); William W. Bewley, Charles D. Merritt, Chadwick L. Canedy, Igor Vurgaftman, U.S. Naval Research Lab. (USA) . . . . [9482-9]

Micro-Raman spectroscopy for meat type detection, Martin De Biasio, Carinthian Tech Research AG (Austria); Dirk Balthasar, TOMRA Sorting GmbH (Germany); Philip Stampfer, Raimund Leitner, Carinthian Tech Research AG (Austria) . . . . [9482-10]

Lunch Break . . . . .Mon 12:10 pm to 1:40 pm

SESSION 2 . . . . .MON 1:40 PM TO 5:00 PM

New Instruments and Techniques

Session Chair: **Jeffry J. Santman,** Corning Advanced Optics (USA)

Characterization of ion-assisted induced absorption in A-Si thin-films used for multivariate optical computing, Aditya B. Nayak, Jimmy Price, Bin Dai, David Perkins, Ding Ding Chen, Christopher M. Jones, Halliburton (USA) . . . . [9482-11]

Photoacoustic sensing with micro-tuning forks *(Invited Paper)*, Ulrike Willer, Michael Köhring, Mario Mordmüller, Technische Univ. Clausthal (Germany); Wolfgang Schade, Fraunhofer-Institut für Nachrichtentechnik Heinrich-Hertz-Institut (Germany) . . . . [9482-12]

Latest developments in DLP based NIR spectrometers enable the next generation of compact, portable systems, Eric Pruett, Pedro Gelabert, Texas Instruments Inc. (USA). . . . . [9482-13]

Quantitative energy dispersive x-ray diffraction for identification of counterfeit medicines: preliminary study, Chiaki Crews, Daniel O'Flynn, Aiden L. Sidebottom, Robert D. Speller, Univ. College London (United Kingdom) . . . . [9482-14]

Long-wave infrared spectroscopy for trace chemical agent detection using hypersorbent materials, Dmitry A. Kozak, R. Andrew McGill, Todd H. Stievater, Viet Nguyen, Robert Furstenberg, Marcel W. Pruessner, U.S. Naval Research Lab. (USA) . . . . [9482-15]

Developing mobile LIBS solutions for real world applications, Qun Li, Katherine A. Bakeev, Jing Li, Sean X. Wang, B&W Tek, Inc. (USA) . . . . [9482-16]

Spectral analysis of rare earth elements, Andrzej W. Miziolek, U.S. Army Research Lab. (USA); Madhavi Z. Martin, Oak Ridge National Lab. (USA); Robert V. Fox, Idaho National Lab. (USA); Frank C. DeLucia Jr., U.S. Army Research Lab. (USA) . . . . [9482-17]

A spectroscopic tool for rapid analysis of wear metals in lubricating oil, Stephen Berkebile, Andrzej W. Miziolek, Frank C. De Lucia Jr., U.S. Army Research Lab. (USA); Mark W. Michie II, David M. Green, U.S. Army Aberdeen Test Ctr. (USA). . . . . [9482-18]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 3 . . . . TUE 8:00 AM TO 12:00 PM

Smartphone Spectroscopy

Session Chair: **Richard A. Crocombe,** Thermo Fisher Scientific Inc. (USA)

Is "good enough" good enough for portable visible and near-visible spectrometry? *(Invited Paper)*, Alexander Scheeline, SpectroClick (USA) . . . . [9482-19]

Demonstration of G-Fresnel cellphone spectrometer, Chenji Zhang, The Pennsylvania State Univ. (USA); Perry S. Edwards, Atoptix, LLC. (USA); Zhiwen Liu, The Pennsylvania State Univ. (USA). . . . . [9482-20]

Smartphone spectroscopy: three unique modalities for point-of-care testing *(Invited Paper)*, Kenneth D. Long, Hojeong Yu, Brian T. Cunningham, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9482-21]

iSPEX: a smartphone spectropolarimeter, Frans Snik, Stephanie Heikamp, Ritse C. Heinsbroek, Felix C. M. Bettonvil, Gerard van Harten, Christoph U. Keller, Leiden Observatory (Netherlands); Jeroen H. H. Rietjens, SRON Netherlands Institute for Space Research (Netherlands); Ramón Navarro, NOVA Optical Infrared Instrumentation Group (Netherlands); Arnoud Apituley, Koninklijk Nederlands Meteorologisch Instituut (Netherlands); Hester Volten, Rijksinstituut voor Volksgezondheid en Milieu (Netherlands); Armand Perduijn, Bright LED Solutions B.V. (Netherlands); Sipke Wadman, Willem Hoving, Avantes B.V. (Netherlands); Norbert Schmidt, DDQ (Netherlands). . . . . [9482-22]

Quantum dots, CMOS sensors and cell phones toward point-of-care-diagnostics *(Invited Paper)*, Eleonora Petryayeva, W. Russ Algar, The Univ. of British Columbia (Canada). . . . . [9482-23]

Mobile phone based mini-spectrometer for rapid screening of skin cancer, Tristan B. Swedish, Mira Moufarrej, Thomas Gurry, Edgar Aranda-Michel, Xu Zhang, Prashant Sharma, Marie Noland, Anshuman J. Das, Ramesh Raskar, Massachusetts Institute of Technology (USA) . . . . [9482-24]

Portable computing for mobile micro-instruments: from hand held devices to smart phones and tablets in spectroscopy, Scott Weagant, Vassili Karanassios, Univ. of Waterloo (Canada) . . . . [9482-25]

Smartphone-embedded chemical luminescence-based biosensors for point-of-need applications, Aldo Roda, Elisa Michelini, Luca Cevenini, Donato Calabria, Maria M. Calabretta, Martina Zangheri, Massimo Di Fusco, Massimo Guardigli, Mara Mirasoli, Patrizia Simoni, Univ. degli Studi di Bologna (Italy) . . . . [9482-26]

Gas detection with microelectromechanical Fabry-Perot interferometer technology in cell phone, Rami Mannila, Risto Hyypiö, Anna Rissanen, VTT Technical Research Ctr. of Finland (Finland). . . . . [9482-27]

Lunch Break and Exhibition Time . . . . Tue 12:00 pm to 1:30 pm

SESSION 5 . . . . TUE 1:30 PM TO 3:10 PM

Novel Infrared and Raman Instruments and Applications

Session Chair: **Leigh J. Bromley,** Daylight Solutions Inc. (USA)

MEMS for imaging spectrometry from the visible to the long wave infrared wavelengths, Dilusha K. K. M. B. D. Silva, Dhirendra K. Tripathi, Haifeng Mao, John Bumgarner, Mariusz Martyniuk, Jarek Antoszewski, John M. Dell, Lorenzo Faraone, The Univ. of Western Australia (Australia) . . . . [9482-28]

Determination of stress in silicon wafers using Raman spectroscopy, Martin De Biasio, Lukas Neumaier, Carinthian Tech Research AG (Austria); Eduard Geier, Michael Rösner, Infineon Technologies Austria AG (Austria); Christina Hirschl, Martin Kraft, Carinthian Tech Research AG (Austria). . . . . [9482-29]

Fuel flexibility via real-time Raman fuel-gas analysis for turbine-system control, Michael P. Buric, Benjamin T. Chorpening, Steven D. Woodruff, David Tucker, National Energy Technology Lab. (USA) . . . . [9482-30]

Ubiquitous transmissive Raman spectroscopy for liquid detection in opaque containers, Vincent Y. Lee, David W. Schiering, Smiths Detection Inc. (USA) . . . . [9482-31]

Modular, reconfigurable matched spectral filter spectrometer, Elizabeth C. Schundler, James R. Engel, OPTRA, Inc. (USA); Thomas C. Gruber Jr., MESH, Inc. (USA); Robert Vaillancourt, Ryan Benedict-Gill, David J. Mansur, John Dixon, Kevin Potter, OPTRA, Inc. (USA) . . . . [9482-32]

SESSION 6 . . . . TUE 3:40 PM TO 6:00 PM

Hyperspectral Imaging I

Session Chair: **Ellen V. Miseo,** Analytical Answers, Inc. (USA)

High spatial resolution LWIR hyperspectral sensor, Carson B. Roberts, Andrew Bodkin, James T. Daly, Bodkin Design & Engineering, LLC (USA) . . . . [9482-33]

Dewar-cooler-integrated MWIR spectrometer for high rates and high-dynamic range measurements, Nicolas Guérineau, Sylvain Rommeluère, Yann Ferrec, Guillaume Druart, ONERA (France); Serge Magli, SOFRADIR (France); Gilles Lasfargues, Commissariat à l'Énergie Atomique (France); Eric D. de Borniol, MINATEC (France) . . . . [9482-34]

Compact, high performance hyperspectral system design and applications, Leah Ziph-Schatzberg, Corning Incorporated (USA) . . . . [9482-35]

Portable, stand-off spectral imaging camera for detection of effluents and residues, Neil Goldstein, Benjamin St. Peter, Jonathan Grot, Michael Kogan, Marsha Fox, Pajo Vujkovic-Cvijin, Ryan Penny, Jason A. Cline, Spectral Sciences, Inc. (USA) . . . . [9482-36]

Detection and direct identification of liquid contaminants at standoff distances with an imaging polarimetric spectrometer, Eugene Tsiang, Jason T. Akagi, Adam Oberbeck, Paul G. Lucey, Edward T. Knobbe, Spectrum Photonics, Inc. (USA) . . . . [9482-37]

Longwave infrared compressive hyperspectral imager, Julia Rentz Dupuis, Bogdan R. Cosofret, Physical Sciences Inc. (USA); Michael J. Kirby, Colorado State Univ. (USA). . . . . [9482-38]

Hyperspectral grating optimization and manufacturing considerations, Lovell E. Comstock, Jeffry J. Santman, Corning Specialty Materials, Inc. (USA) . . . . [9482-39]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Divalent chromium doped ZnSe nanoparticles random laser induced by nanosecond laser pulse, Jiayu Yi, Guoying Feng, Chao Yang, Shouhuan Zhou, Sichuan Univ. (China) . . . . [9482-54]

WEDNESDAY 22 APRIL

SESSION 7 . . . . WED 8:00 AM TO 9:20 AM

Chemometrics and Hyperspectral Imaging

Session Chair: **Ulrike Willer,** Technische Univ. Clausthal (Germany)

Fluorescent marker-based and marker-free discrimination between healthy and cancerous human tissues using hyper-spectral imaging, Thomas Arnold, Martin De Biasio, Raimund Leitner, Carinthian Tech Research AG (Austria) . . . . [9482-40]

Transference of chemometric models to non-identical systems, Kellen J. Sorauf, Regis Univ. (USA); Amy J. R. Bauer, TSI Inc. (USA); Frank C. DeLucia Jr., Andrzej W. Miziolek, U.S. Army Research Lab. (USA) . . . . [9482-41]

Spectral data analysis approaches for improved provenance classification, Andrzej W. Miziolek, U.S. Army Research Lab. (USA); Kellen J. Sorauf, Regis Univ. (USA); Amy J. R. Bauer, TSI Inc. (USA); Fank C. De Lucia Jr., U.S. Army Research Lab. (USA) . . . . [9482-42]

Filter selection criteria for the discrimination of strongly overlapping chemical spectra, Kevin J. Major, Menelaos K. Poutous, Kevin F. Dunnill, The Univ. of North Carolina at Charlotte (USA); Kenneth J. Ewing, Jasbinder S. Sanghera, U.S. Naval Research Lab. (USA); Ishwar D. Aggarwal, The Univ. of North Carolina at Charlotte (USA) . . . . [9482-43]

SESSION 8 . . . . WED 9:20 AM TO 10:20 AM

Hyperspectral Imaging II

Session Chair: **Ulrike Willer,** Technische Univ. Clausthal (Germany)

Compact hyperspectral image sensor based on a novel hyperspectral encoder, Alex Hegyi, Joerg Martini, PARC, a Xerox Co. (USA) . . . . [9482-44]

NASA Goddard's LiDAR, Hyperspectral, and Thermal airborne imager (G-LiHT), Lawrence A. Corp, Bruce D. Cook, Elizabeth M. Middleton, NASA Goddard Space Flight Ctr. (USA) . . . . [9482-45]

Characterization of AOTF based Spectropolarimetric Imagers from 400 to 1700 nm, Neelam Gupta, U.S. Army Research Lab. (USA); John C. Morgan, U.S. Army Engineer Research and Development Ctr. (USA); Dennis Suhre, DRS Scientific Inc. (USA). . . . . [9482-46]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:20 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 9 . . . . .WED 1:00 PM TO 3:20 PM

Hyperspectral Imaging III

Session Chair: **David P. Bannon,** Headwall Photonics Inc. (USA)

Low SWaP multispectral sensors using dichroic filter arrays, Todd Jennings, John D. Dougherty, Pixelteq, Inc. (USA) . . . . [9482-47]

Inverse analysis of triarylamine-dye transmission spectra, Daniel Aiken, Scott A. Ramsey, Troy Mayo, Jim Bellemare, Samuel G. Lambrakos, Joseph E. Peak, U.S. Naval Research Lab. (USA) . . . . [9482-48]

Weighted Chebyshev Distance classification method for

hyperspectral imaging, Suleyman Demirci, Turkish Air Force Academy (Turkey); Iþýn Erer, Istanbul Technical Univ. (Turkey); Okan K. Ersoy, Purdue Univ. (USA) . . . . [9482-49]

Optical system design of a Dyson imaging spectrometer based on Fery prism, Linlin Pei, Academy of Opto-Electronics (China). . . . . [9482-50]

errors in imaging of computational imaging spectrometer caused by sampling, Jianwei Wang, Academy of Opto-Electronics (China). . . . . . [9482-51]

Drill core imaging spectrometer record compiling system, Taixia Wu, Lifu Zhang, Hongming Zhang, Qingxi Tong, Institute of Remote Sensing and Digital Earth (China) . . . . [9482-52]

Turbine jet exhaust as proxy for detection of wake vortices, Taumi Daniels, NASA Langley Research Ctr (USA) . . . . [9482-53]

SEE PROFESSIONAL DEVELOPMENT COURSES
pages 145–214

CONFERENCE 9483

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9483

Terahertz Physics, Devices, and Systems IX: Advanced Applications in Industry and Defense

Conference Chairs: **Mehdi F. Anwar,** Univ. of Connecticut (USA); **Thomas W. Crowe,** Virginia Diodes, Inc. (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

Program Committee: **Giles Davies,** Univ. of Leeds (United Kingdom); **Gottfried H. Döhler,** Max Planck Institute for the Science of Light (Germany); **Achyut K. Dutta,** Banpil Photonics, Inc. (USA); **M. Saif Islam,** Univ. of California, Davis (USA); **Hiroshi Ito,** Kitasato Univ. (Japan); **Peter Uhd Jepsen,** Technical Univ. of Denmark (Denmark); **Edmund H. Linfield,** Univ. of Leeds (United Kingdom); **Amir Hamed Majedi,** Univ. of Waterloo (Canada); **Taiichi Otsuji,** Tohoku Univ. (Japan); **Nezih Pala,** Florida International Univ. (USA); **Azizur Rahman,** City Univ. London (United Kingdom); **Victor Ryzhii,** Univ. of Aizu (Japan); **Andre U. Sokolnikov,** Visual Solutions and Applications (USA); **Ashok K. Sood,** Magnolia Optical Technologies, Inc. (USA); **Sigfrid K. Yngvesson,** Univ. of Massachusetts Amherst (USA); **Weili Zhang,** Oklahoma State Univ. (USA)

WEDNESDAY 22 APRIL

SESSION 1. . . . . .WED 8:00 AM TO 10:00 AM

Novel Concepts I

Session Chairs: **Thomas W. Crowe,** Virginia Diodes, Inc. (USA); **B. M. Azizur Rahman,** City Univ. London (United Kingdom)

Terahertz nonreciprocal transmission in asymmetry magneto-metasurface *(Invited Paper)*, Sai Chen, Fei Fan, Bo Liu, Shengjiang Chang, Nankai Univ. (China) . . . . [9483-1]

Enhancement of THz signal intensity by plasmonic monopole nanoantenna *(Invited Paper)*, Ekmel Özbay, Bilkent Univ. (Turkey) . . . . [9483-2]

GaN-based terahertz quantum cascade lasers *(Invited Paper)*, Wataru Terashima, Hideki Hirayama, RIKEN (Japan) . . . . [9483-39]

Study on gas molecule adsorption-desorption dynamics on graphene using terahertz emission spectroscopy *(Invited Paper)*, Iwao Kawayama, Osaka Univ. (Japan); Saikat Talapatra, Southern Illinois University-Carbondale (USA); Robert Vajtai, Rice Univ. (USA); Pulickel Madhavapanicker Ajayan, Rice University (USA); Junichiro Kono, Rice Univ. (USA); Tonouchi Masayoshi, Osaka Univ (Japan). . . . . [9483-4]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 2 . . . . WED 1:00 PM TO 3:00 PM

THz Sources I

Session Chairs: **Mehdi F. Anwar,** Univ. of Connecticut (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

Terahertz metamaterials for modulation and detection *(Invited Paper)*, Sameer Sonkusale, Tufts Univ. (USA); Pramod Singh, Tufts University (USA); Saroj Rout, Tufts Univ (USA); Guoqing Fu, Wangren Xu, Tufts University (USA) . . . . [9483-5]

Terahertz-wave detector modules implementing zero-biased InGaAsp Schottky-barrier diodes *(Invited Paper)*, Hiroshi Ito, Kitasato Univ. (Japan). . . . . [9483-6]

THz-wave parametric amplifier using LiNbO3 crystal *(Invited Paper)*, Kodo Kawase, Nagoya Univ. (Japan) and RIKEN (Japan); Kosuke Murate, Kazuki Imayama, Nagoya Univ. (Japan); Shin'ichiro Hayashi, RIKEN (Japan). . . . . [9483-7]

Terahertz oscillators and receivers using electron devices for high-capacity wireless communication *(Invited Paper)*, Safumi Suzuki, Masahiro Asada, Tokyo Institute of Technology (Japan) . . . . [9483-8]

SESSION 3 . . . . .WED 3:30 PM TO 4:30 PM

Keynote Session

Session Chairs: **Thomas W. Crowe,** Virginia Diodes, Inc. (USA); **Taiichi Otsuji,** Tohoku Univ. (Japan)

Recent advances in room temperature THz emitter based on DFG at CQD/NU *(Invited Paper)*, Manijeh Razeghi, Northwestern Univ. (USA) . . . . [9483-9]

SESSION 4 . . . . .WED 4:30 PM TO 6:10 PM

THz Sources II

Session Chair: **Mehdi F. Anwar,** Univ. of Connecticut (USA)

Compact THz receivers *(Invited Paper)*, Thomas W Crowe, Virginia Diodes, Inc. (USA); Eric W Bryerton, Jeffrey L Hesler, Virginia Diodes Inc (USA) . . . . [9483-10]

Chip scale polarization rotator on SOI for mid-IR: design and analysis *(Invited Paper)*, B. M. A Rahman, City Univ. London (United Kingdom); Ajanta Barh, Ravi K Varshney, Indian Institute of Technology Delhi (India); Bishnu P Pal, Mahindra Ecole Centrale (India) . . . . [9483-3]

Radar system components to detect small and fast objects, Axel Hülsmann, Christian Zech, Mathias Klenner, Axel Tessmann, Arnulf Leuther, Michael Schlechtweg, Oliver Ambacher, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany) . . . . [9483-11]

Optical simulation of terahertz antenna using finite difference time domain method, Chao Zhang, Zoran Ninkov, Gregory J. Fertig, Rochester Institute of Technology (USA); Andrew P. Sacco, J. Daniel Newman, Kenneth D. Fourspring, Exelis Geospatial Systems (USA); Paul P. K. Lee, IEEE (USA); Zeljko Ignjatovic, Judith L. Pipher, Craig W. McMurtry, Jagannath Dayalu, Univ. of Rochester (USA) . . . . [9483-12]

THURSDAY 23 APRIL

SESSION 5 . . . . THU 8:00 AM TO 10:10 AM

Advanced Materials and Devices

Session Chairs: **Taiichi Otsuji,** Tohoku Univ. (Japan); **Weili Zhang,** Oklahoma State Univ. (USA)

Metasurface induced terahertz transparency and absorption *(Invited Paper)*, Weili Zhang, Oklahoma State Univ. (USA). . . . . [9483-13]

Optical parameters of ZnMgO/ZnO core-shell structures in THz regime *(Invited Paper)*, Anas Mazady, Abdiel Rivera, Kiarash Ahi, Mehdi Anwar, Univ. of Connecticut (USA). . . . . [9483-14]

Tuning of terahertz metamaterials' resonances via near field coupling *(Invited Paper)*, Abul K Azad, Ctr. for Integrated Nanotechnologies (USA) . . . . [9483-15]

SENSING TECHNOLOGY + APPLICATIONS

Phase characteristics of subwavelength antenna elements for efficient design of terahertz frequency and millimeter-wavelength metasurfaces, Richard J Williams, Andrew J Gatesman, Univ. of Massachusetts Lowell (USA); William E Nixon, US Army National Ground Intelligence Center (USA). . [9483-16]

Sub-THz materials measurements based on low loss corrugated waveguides *(Invited Paper),* Emile de Rijk, Alessandro Macor, SWISSto12 SA (Switzerland) . . . . [9483-33]

SESSION 6 . . . . THU 10:40 AM TO 12:10 PM

Novel Concepts II

Session Chairs: **Thomas W. Crowe,** Virginia Diodes, Inc. (USA); **B. M. Azizur Rahman,** City Univ. London (United Kingdom)

Extreme THz nonlinearities: high-harmonic generation, dynamical Bloch oscillations and interband Zener tunneling in bulk semiconductors *(Invited Paper)*, Christoph Lange, Olaf Schubert, Matthias Hohenleutner, Fabian Langer, Univ. Regensburg (Germany); Benedikt Urbanek, University of Regensburg (Germany); Ulrich Huttner, Daniel Golde, Philipps-Univ. Marburg (Germany); Torsten Meier, Univ. Paderborn (Germany); Mackillo Kira, Stephan W Koch, Philipps-Univ. Marburg (Germany); Rupert Huber, Univ. Regensburg (Germany) . . . . [9483-17]

A review on THz characterization of electronic components and a comparison of THz imaging characterization with other techniques *(Invited Paper)*, Kiarash Ahi, Univ. of Connecticut (USA); Navid Asadizanjani, Sina Shahbazmohamadi, Mark Tehranipoor, University of Connecticut (USA); Mehdi Anwar, Univ. of Connecticut (USA) . . . . [9483-18]

Solid-state THz sources with higher power *(Invited Paper)*, Thomas W Crowe, Virginia Diodes, Inc. (USA); Steven A Retzloff, Jeffrey L Hesler, Virginia Diodes Inc (USA) . . . . [9483-19]

Lunch Break and Exhibition Time . . . . Thu 12:00 pm to 1:20 pm

SESSION 7 . . . . .THU 1:30 PM TO 3:20 PM

THz Spectroscopy

Session Chairs: **Mehdi F. Anwar,** Univ. of Connecticut (USA); **Hiroshi Ito,** Kitasato Univ. (Japan)

Nonlinear optical frequency up-conversion broadening terahertz horizons in sensitive detection *(Invited Paper)*, Kouji Nawata, Shin'ichiro Hayashi, Hiroaki Minamide, RIKEN (Japan) . . . . [9483-20]

Laminated materials characterization by terahertz kinetics spectroscopy, Anis Rahman, Aunik K. Rahman, Applied Research & Photonics, Inc. (USA) . . . . [9483-21]

Experimental determination of terahertz atmospheric absorption parameters, David M. Slocum, Thomas M. Goyette, Robert H. Giles, Univ. of Massachusetts Lowell (USA); William E. Nixon, National Ground Intelligence Ctr. (USA) . . . . [9483-22]

Possibility of the detection and identification of substance at long distance using the noisy reflected THz pulse under real conditions, Vyacheslav A. Trofimov, Svetlana A. Varentsova, Vladislav V. Trofimov, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9483-23]

THz magneto-photoresponse spectroscopy of HgTe based quantum well (gapped Dirac type electronic dispersion), Mehdi Pakmehr, Univ. at Buffalo (USA); Christoph Bruene, Laurens W. Molenkamp, Julius-Maximilians-Univ. Würzburg (Germany); Bruce D. McCombe, Univ. at Buffalo (USA). . . . . [9483-24]

SESSION 8 . . . . THU 3:50 PM TO 6:00 PM

THz Imaging

Session Chairs: **Thomas W. Crowe,** Virginia Diodes, Inc. (USA); **B. M. Azizur Rahman,** City Univ. London (United Kingdom)

Room temperature terahertz detectors and their applications *(Invited Paper)*, Jian Chen, Xuecou Tu, Lin Kang, Biaobing Jin, Peiheng Wu, Nanjing Univ. (China) . . . . [9483-25]

Performances of THz cameras with enhanced sensitivity in sub-terahertz region, Naoki Oda, Tsutomu Ishi, Seiji Kurashina, Takayuki Sudou, Takao Morimoto, Masaru Miyoshi, Kohei Doi, Hideki Goto, Tokuhito Sasaki, NEC Corp. (Japan); Goro Isoyama, Ryukou Kato, Akinori Irizawa, Keigo Kawase, The Institute of Scientific and Industrial Research (Japan) . . . . [9483-26]

MCT as sub-terahertz and infrared detector, Fiodor F. Sizov, Vyacheslav V. Zabudsky, V.E. Lashkaryov Institute of Semiconductor Physics (Ukraine); Sergey A. Dvoretsky, A.V. Rzhanov Institute of Semiconductor Physics (Russian Federation); Vladimir A. Petryiakov, Aleksandr G. Golenkov, Katerina V. Andreyeva, Zinoviia F. Tsybrii, Anna V. Shevchik-Shekera, V.E. Lashkaryov Institute of Semiconductor Physics (Ukraine); Ernesto Dieguez, Univ. Autónoma de Madrid (Spain) . . . . [9483-27]

Real-time THz beam profiling and imaging with laser-based intense THz sources, Yung Jun Yoo, Taek Il Oh, Yong Sing You, Ki-Yong Kim, Univ. of Maryland, College Park (USA). . . . . [9483-28]

Robust identification of concealed dangerous substances using THz imaging spectroscopy, Arthur D. van Rheenen, Magnus W. Haakestad, Norwegian Defence Research Establishment (Norway); Helle E. Nystad, Norwegian Univ. of Science and Technology (Norway) . . . . [9483-29]

Dark field THz camera imaging measurements, 200 GHz to 400 GHz, Andrew P. Sacco, J. Daniel Newman, Exelis Geospatial Systems (USA); Paul P. K. Lee, Univ. of Rochester (USA); Kenneth D. Fourspring, John H. Osborn, Robert D. Fiete, Exelis Geospatial Systems (USA); Mark F. Bocko, Zeljko Ignjatovic, Judith L. Pipher, Craig W. McMurtry, Xi-Cheng Zhang, Jagannath Dayalu, Univ. of Rochester (USA); Katherine Seery, Chao Zhang, Zoran Ninkov, Rochester Institute of Technology (USA) . . . . [9483-30]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Inspection of mechanical and electrical properties of silicon wafers using terahertz tomography and spectroscopy, Thomas Arnold, Wolfgang Mühleisen, Johannes Schicker, Christina Hirschl, Raimund Leitner, Carinthian Tech Research AG (Austria) . . . . [9483-31]

Variation of ZnMgO properties upon growth technique in THz spectrum, Abdiel Rivera, Anas Mazady, Kiarash Ahi, Mehdi Anwar, Univ. of Connecticut (USA) . . . . [9483-32]

CONFERENCE 9484

Wednesday–Friday 22–24 April 2015 • Proceedings of SPIE Vol. 9484

Compressive Sensing IV

Conference Chair: **Fauzia Ahmad,** Villanova Univ. (USA)

Program Committee: **Moeness G. Amin,** Villanova Univ. (USA); **Gonzalo R. Arce,** Univ. of Delaware (USA); **Abdesselam Salim Bouzerdoum,** Univ. of Wollongong (Australia); **Michael J. DeWeert,** BAE Systems (USA); **Matthew A. Herman,** InView Technology Corp. (USA); **Eric L. Mokole,** U.S. Naval Research Lab. (USA); **Ram M. Narayanan,** The Pennsylvania State Univ. (USA); **Dimitris A. Pados,** Univ. at Buffalo (USA); **Athina P. Petropulu,** Rutgers, The State Univ. of New Jersey (USA); **Zhijun G. Qiao,** The Univ. of Texas-Pan American (USA); **Ervin Sejdic,** Univ. of Pittsburgh (USA); **Lei (Leslie) Ying,** Univ. at Buffalo (USA)

WEDNESDAY 22 APRIL

SESSION 1. . . . . WED 3:30 PM TO 4:50 PM

Compressive Sensing for Radar

Session Chair: **Ram M. Narayanan,** The Pennsylvania State Univ. (USA)

Compressive sensing imaging for general SAR echo model based on Maxwell's equations, Bing Sun, Shuxia Li, Yufeng Cao, Zhijun G. Qiao, The Univ. of Texas-Pan American (USA) . . . . [9484-1]

Sparsity-based moving target localization using multiple dual-frequency radars, Khodour AlKadry, Fauzia Ahmad, Moeness G. Amin, Villanova Univ. (USA) . . . . [9484-2]

Cross-term free based bistatic radar system using sparse least squares, Rasim A. Sevimli, Ahmet E. Cetin, Bilkent Univ. (Turkey) . . . . [9484-3]

Multi-view TWRI scene reconstruction using a joint Bayesian sparse approximation model, Van Ha Tang, Abdesselam Bouzerdoum, Son Lam Phung, Fok Hing Chi Tivive, Univ. of Wollongong (Australia) . . . . [9484-4]

THURSDAY 23 APRIL

SESSION 2 . . . . THU 9:00 AM TO 10:20 AM

Compressive Sensing for Spectral Imaging

Session Chair: **Gonzalo R. Arce,** Univ. of Delaware (USA)

Point-spread functions for coded aperture imaging with separable doubly-Toeplitz masks, Michael J. DeWeert, BAE Systems (USA) . . . . [9484-5]

Computational imaging in a multiplexed imager with static multispectral encoding, Johann Veras, Robert R. Muise, Kevin Hines, Lockheed Martin Corp. (USA) . . . . [9484-6]

Compressive and classical hyperspectral systems: a fundamental comparison, Isaac Y. August, Adi Shay, Adrian Stern, Ben-Gurion Univ. of the Negev (Israel). . . . . [9484-7]

Compressive spectral polarization imaging with coded micropolarizer array, Chen Fu, Univ. of Delaware (USA); Henry Arguello, Univ. Industrial de Santander (Colombia); Gonzalo R. Arce, Univ. of Delaware (USA); Brian M. Sadler, U.S. Army Research Lab. (USA) . . . . [9484-8]

SESSION 3 . . . . THU 10:50 AM TO 12:10 PM

CS for Optical Imaging, Motion Imagery, and Video I

Session Chair: **Michael J. DeWeert,** BAE Systems (USA)

Recent results in single-pixel compressive imaging using selective measurement strategies *(Invited Paper)*, Matthew A. Herman, InView Technology Corp. (USA) . . . . [9484-9]

L1-PCA video surveillance, Ying Liu, Dimitris A. Pados, Univ. at Buffalo (USA) . . . . [9484-10]

Gradient-based compressive sensing for noise video reconstruction, Huihuang Zhao, Hengyang Normal Univ. (China); Shuxia Li, John Montalbo, Zhijun G. Qiao, The Univ. of Texas-Pan American (USA) . . . . [9484-11]

Lunch Break and Exhibition Time . . . . Thu 12:10 pm to 1:40 pm

SESSION 4 . . . . THU 1:40 PM TO 3:20 PM

CS Signal Processing

Session Chair: **Ervin Sejdic,** Univ. of Pittsburgh (USA)

Compressive sensing cryptographic analysis, Ponciano J. Escamilla-Ambrosio, Moises Salinas Rosales, Eleazar Aguirre-Anaya, Ctr. de Investigación en Computación (Mexico) . . . . [9484-12]

Sparsity-based DOA estimation of coherent and uncorrelated sources using transmit/receive co-prime arrays, Elie BouDaher, Fauzia Ahmad, Moeness G. Amin, Villanova Univ. (USA) . . . . [9484-13]

See-through obscurants via compressive sensing in degraded visual environment, Richard C. Lau, Ted K. Woodward, Applied Communication Sciences (USA) . . . . [9484-14]

An analysis of spectral transformation techniques on graphs, Igor Djurovic, Univ. of Montenegro (Montenegro); Ervin Sejdic, Univ. of Pittsburgh (USA); Nikola Bulatovic, Marko Simeunovic, Univ. of Montenegro (Montenegro) . . . . [9484-15]

Time-frequency signature sparse reconstruction using chirp dictionary, Yen T. H. Nguyen, Univ. of Leeds (United Kingdom) and Villanova Univ. (USA); Moeness G. Amin, Villanova Univ. (USA); Mounir Ghogho, Univ. of Leeds (United Kingdom) and Univ. Internationale de Rabat (Morocco); Des McLernon, Univ. of Leeds (United Kingdom) . . . . [9484-16]

SESSION 5 . . . . THU 3:50 PM TO 4:50 PM

CS for Optical Imaging, Motion Imagery, and Video II

Session Chair: **Matthew A. Herman,** InView Technology Corp. (USA)

Compressive line sensing imaging system using active spatial light modulation devices, Bing Ouyang, Harbor Branch Oceanographic Institute (USA) and Florida Atlantic Univ. (USA); Weilin W. Hou, U.S. Naval Research Lab. (USA); Frank M. Caimi, Fraser R. Dalgleish, Anni K. Vuorenkoski, Harbor Branch Oceanographic Institute (USA); Cuiling Gong, Texas Christian Univ. (USA); Walter Britton, Harbor Branch Oceanographic Institute (USA) . . . . [9484-17]

Compressive quantum sensing *(Invited Paper)*, John C. Howell, Gregory Howland, Daniel Lum, Univ. of Rochester (USA) . . . . [9484-18]

FRIDAY 24 APRIL

SESSION 6 . . . . FRI 8:40 AM TO 10:00 AM

CS for Acoustics, Ultrasound, and Health Monitoring of Structures

Session Chair: **Dimitris A. Pados,** Univ. at Buffalo (USA)

Sparse spectral estimation techniques for output-only modal system identification of civil engineering structures, Agathoklis Giaralis, Bamrung Tausiesakul, Kyriaki Gkoktsi, City Univ. London (United Kingdom) . . . . [9484-19]

Multimodal exploitation and sparse reconstruction for guided-wave structural health monitoring, Andrew L. Golato, Sridhar Santhanam, Fauzia Ahmad, Moeness G. Amin, Villanova Univ. (USA) . . . . [9484-20]

Seismic traces reconstruction from compressive measurements, Ana Ramirez, Gonzalo R. Arce, Univ. of Delaware (USA) . . . . [9484-21]

Group sparsity based estimation of nonstationary harmonic signals, Yimin D. Zhang, Villanova Univ. (USA) . . . . [9484-22]

SESSION 7 . . . . FRI 10:30 AM TO 11:30 AM

CS for Healthcare and Biomedical Applications

Session Chair: **Fauzia Ahmad,** Villanova Univ. (USA)

Robust architecture for wireless surface EMG sensors based on analog compressed sensing theory, Mohammadreza Balouchestani, Sri Krishnan, Ryerson Univ. (Canada). . . . . [9484-23]

Neighborhood-cost based sampling design for randomly sampled parallel MRI with low rank constrants, Wan Kim, The State Univ. of New York (USA); Leslie Ying, The State Univ. of New York (USA) . . . . [9484-24]

Advanced K-means clustering algorithm for long-term surface EMG monitoring based on compressed sensing theory, Mohammadreza Balouchestani, Sridhar Krishnan, Ryerson Univ. (Canada) . . . . [9484-25]

CONFERENCE 9485

Monday–Thursday 20–23 April 2015 • Proceedings of SPIE Vol. 9485

Thermosense: Thermal Infrared Applications XXXVII

Conference Chair: **Sheng-Jen (Tony) Hsieh,** Texas A&M Univ. (USA)

Conference Co-Chair: **Joseph N. Zalameda,** NASA Langley Research Ctr. (USA)

Program Committee: **Andrea Acosta,** Colbert Infrared Services (USA); **Nicolas Avdelidis,** National Technical Univ. of Athens (Greece); **Paolo Bison,** Consiglio Nazionale delle Ricerche (Italy); **Jeff R. Brown,** Embry-Riddle Aeronautical Univ. (USA); **Douglas Burleigh,** La Jolla Cove Consulting (USA); **Fred P. Colbert,** Colbert Infrared Services (USA); **K. Elliott Cramer,** NASA Langley Research Ctr. (USA); **Ralph B. Dinwiddie,** Oak Ridge National Lab. (USA); **Herbert Kaplan,** Honeyhill Technical Co. (USA); **Timo T. Kauppinen,** VTT Technical Research Ctr. of Finland (Finland); **Dennis H. LeMieux,** Siemens Power Generation, Inc. (USA); **Monica Lopez Saenz,** IRCAM GmbH (Germany); **Xavier P. V. Maldague,** Univ. Laval (Canada); **Gary L. Orlove,** FLIR Systems, Inc. (USA); **Beata Oswald-Tranta,** Montan Univ. Leoben (Austria); **G. Raymond Peacock,** Temperatures.com, Inc. (USA); **Piotr Pregowski,** Pregowski Infrared Services (Poland); **Ralph A. Rotolante,** Vicon Enterprises Inc. (USA); **Andres E. Rozlosnik,** SI Termografía Infrarroja (Argentina); **Morteza Safai,** The Boeing Co. (USA); **Takahide Sakagami,** Kobe Univ. (Japan); **Steven M. Shepard,** Thermal Wave Imaging, Inc. (USA); **Sami Siikanen,** VTT Technical Research Ctr. of Finland (Finland); **Gregory R. Stockton,** Stockton Infrared Thermographic Services, Inc. (USA); **Vladimir P. Vavilov,** Tomsk Polytechnic Univ. (Russian Federation); **Xiong Yu,** Case Western Reserve Univ. (USA)

ThermoSense Mission Statement

The Infrared Applications, ThermoSense conference promotes the worldwide exchange of information about the uses or applications of thermal infrared sensing, imaging and measuring instruments through papers, workshops and short-courses. Over the past thirty seven years these activities have included topics from the fundamentals of imaging and calibration to virtually all civilian applications of infrared equipment with special emphasis on problem solving and reduction to practice.

Thermosense Background

Thermosense is the oldest and largest international technical meeting focused on scientific, industrial and general uses of infrared imaging and infrared temperature measurements. Its regular printed proceedings are found in most scientific and engineering libraries, providing an unequaled depth and breadth of technical information and reference data. Further information regarding Thermosense can be found at: www.thermosense.org

MONDAY 20 APRIL

VENDOR SESSION. . . . . 1:00 PM TO 5:00 PM

The Infrared Applications: ThermoSense XXXVII

Moderators: **Andrés E. Rozlosnik,** SI Termografia Infrarroja (Argentina), and **Herb Kaplan,** Honeyhill Technical Co. (USA)

The Infrared Applications: ThermoSense XXXVII Vendor Session will be held on Monday afternoon, 20 April 2015 as part of SPIE's DSS 2015 Conference in Baltimore. The session will feature brief presentations from hardware and software vendors whose product lines impact thermal imaging applications.

Unlike the technical sessions, there are no "commercial content" restrictions in these presentations.

This event allows vendors to showcase new products on display at this year's exhibit, and provides attendees with an advance glimpse of "what's new" in thermal imaging applications.

All exhibitors are eligible to present.

The Vendor Session was started eleven years ago and has been a popular, well-attended success. It allows the busy technical conference attendees to better prioritize their time when visiting the exhibits. It also provides a relaxed atmosphere for informal conversations between vendors and conference attendees.

The session begins with 10-15 minute presentations and is followed by a reception and mixer with snacks and soft drinks.

Plan your travel to arrive early enough to get this valuable preview of evolving technology.

Any exhibitor offering products or services related to infrared sensing or imaging can participate, but vendor time slots are limited and available on a first-come first-served basis.

To register as a presenter, please provide the following:

- Name, title, affiliation and contact information for the presenter
- Title of presentation
- Brief (one line) summary of presentation content

The list of participating vendors and the content of their presentations will appear in the final program. If you are interested in participating or have any questions, please contact:

Vendors Session 2014 Moderators:

Herb Kaplan, hkaplan@earthlink.net

or **Andrés Rozlosnik**, or aer@termografia.com

VENDORS IN PRESENTATION ORDER:

Magnity Electronics (Booth 330)
New development in thermal imaging technologies at Magnity Electronics
Presenter: **Chongfei Shen,** CEO

Thermoteknix (Booth 308)
New product developments from Thermoteknix Systems Ltd.
Presenter: **Alistair Brown,** Product Manager

StingRay Optics, LLC (Booth 958)
StingRay Optics Standard Products 2015
Presenter: **Sam Wyman,** Standard Products Specialist

SCD.USA, LLC (SemiConductor Devices) (Booth 911)
Newest Products for 2015 from SCD
Presenter: **Robert McDaniel,** President and CEO SCD.USA

Xenics (Booth 825)
Low and high temperature thermographic solutions
Presenter: **Jan Vermeiren,** Technical Adviser & Business Development Manager

CONFERENCE 9485

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 1. . . . . TUE 8:00 AM TO 10:10 AM

Aerospace Applications

Session Chairs: **Xavier Maldague,** Univ. Laval (Canada); **Ralph B. Dinwiddie,** Oak Ridge National Lab. (USA)

Real time fatigue damage growth assessment of a composite 3 stringer panel using passive thermography *(Invited Paper)*, Joseph N. Zalameda, Eric R. Burke, NASA Langley Research Ctr. (USA); Michael R. Horne, National Institute of Aerospace (USA) . . . . [9485-1]

Nondestructive evaluation of aircraft coatings with infrared diffuse reflectance spectra, Michael R. Hawks, Air Force Institute of Technology (USA) and Oak Ridge Institute for Science & Education (USA); Kody A. Wilson, Air Force Institute of Technology (USA); Timothy W. C. Zens, Air Command and Staff College (USA); Adam T. Cooney, Hans G. Korth, Air Force Research Lab. (USA) . . . . [9485-2]

Comparative evaluation of aerospace composites using thermography and ultrasonic NDT techniques, Panagiotis Theodorakeas, Nicolas P. Avdelidis, Eleni Cheilakou, National Technical Univ. of Athens (Greece); Roubini Marini, Hellenic Aerospace Industry S.A. (Greece); Maria Koui, National Technical Univ. of Athens (Greece). . . . . [9485-3]

A new approach on JPSS VIIRS BCS and SVS PRT calibration, Tung R. Wang, Steve A. Marschke, Michael Borroto, Christopher M. Jones, Christopher Chovit, Raytheon Co. (USA) . . . . [9485-4]

Composites evaluation in aircraft industry through triplex IR imaging system, Bob Berry, Thermal Vision (Ireland). . . . . [9485-5]

Integration of infrared and optical imaging techniques for the nondestructive inspection of aeronautic parts, Fernando López, UFSC (Brazil); Stefano Sfarra, Univ. degli Studi dell'Aquila (Italy); Clemente Ibarra-Castanedo, Univ. Laval (Canada); Domenica Paoletti, Univ. degli Studi dell'Aquila (Italy); Xavier Maldague, Univ. Laval (Canada). . . . . [9485-6]

SESSION 2 . . . . TUE 10:40 AM TO 12:00 PM

Building Materials and Infrastructure Applications I

Session Chairs: **Jeff R. Brown,** Embry-Riddle Aeronautical Univ. (USA); **Beata Oswald-Tranta,** Montan Univ. Leoben (Austria)

Identification of moisture sources in building assemblies using IRT, Gregory B. McIntosh, Snell Infrared Canada (Canada); Antonio Colantonio, Public Works and Government Services Canada (Canada) . . . . [9485-7]

Evaluation of angle dependence in spectral emissivity of ceramic tiles measured by FT-IR, Chie Kobayashi, Nagahisa Ogasawara, Hiroyuki Yamada, Syunsuke Yamada, National Defense Academy (Japan); Takashi Kikuchi, K-Plus, Inc. (Japan) . . . . [9485-8]

Study of experimental parameters for active IRT applications in multi-layered building elements with internal defects, Catarina L. Serra, ITeCons (Portugal) and Pólo II da Univ. de Coimbra (Portugal); Nuno A. Simões, Pólo II da Univ. de Coimbra (Portugal); António Tadeu, Univ. de Coimbra (Portugal) . . . . [9485-9]

Active infrared thermographic testing with distance heating, Nagahisa Ogasawara, Hikaru Ando, Chie Kobayashi, Hiroyuki Yamada, National Defense Academy (Japan). . . . . [9485-10]

Lunch Break and Exhibition Time . . . . Tue 12:00 pm to 1:30 pm

SESSION 3 . . . . .TUE 1:30 PM TO 5:00 PM

Building Materials and Infrastructure Applications II

Session Chairs: **Beata Oswald-Tranta,** Montan Univ. Leoben (Austria); **Jeff R. Brown,** Embry-Riddle Aeronautical Univ. (USA)

Comparison of lock-in and pulse-phase thermography for defect characterization in FRP composites applied to concrete, Jeff R. Brown, Sai Harsha Chittineni, Embry-Riddle Aeronautical Univ. (USA) . . . . [9485-11]

Crack depth determination with inductive thermography, Beata Oswald-Tranta, Roland Schmidt, Montan Univ. Leoben (Austria) . . . . [9485-12]

Measurement of flaw size from thermographic data, William P. Winfree, Joseph N. Zalameda, Patricia A. Howell, NASA Langley Research Ctr. (USA) . . . . [9485-13]

Characterization of vertical cracks using ultrasound excited lock-in thermography, Arantza Mendioroz, Univ. del País Vasco (Spain); Ricardo Celorrio, Univ. de Zaragoza (Spain); Agustín Salazar, Univ. del País Vasco (Spain) . . . . [9485-14]

Automatic thermographic scanning with the creation of 3D panoramic views, Alessandro Bortolin, Gianluca Cadelano, Giovanni Ferrarini, Consiglio Nazionale delle Ricerche (Italy) . . . . [9485-15]

Comparison of step heating and modulated frequency thermography for detecting bubble defects in colored acrylic glass, Sheng-Jen Hsieh, Hongjin Wang, Texas A&M Univ. (USA) . . . . [9485-16]

Detection of pinhole pefects in optical film using thermography and artificial neural network, Sheng-Jen Hsieh, Bhavana Singh, Texas A&M Univ. (USA) . . . . [9485-17]

Testing and evaluation of concrete structures by thermal wave imaging, Ravibabu Mulaveesala, Geetika Dua, Indian Institute of Technology Ropar (India); Ghali V. Subbarao, K L Univ. (India) . . . . [9485-18]

Studying industrial-scale rack-storage fires using IR thermography, Jaap de Vries, FM Global (USA). . . . . [9485-19]

WEDNESDAY 22 APRIL

SESSION 4 . . . . WED 8:00 AM TO 10:10 AM

Detector and Sensory System Development

Session Chairs: **Joseph N. Zalameda,** NASA Langley Research Ctr. (USA); **Chien-Chon Chen,** National United Univ. (Taiwan)

Advances in infrared fibers *(Invited Paper)*, Guangming Tao, Ayman F. Abouraddy, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9485-20]

Logarithmic InGaAs detectors with global shutter and active dark current reduction, Yang Ni, New Imaging Technologies (France) . . . . [9485-21]

The fabrication of sub-micron size caesium iodide x-ray scintillator, Chien Wan Hun, Po Chun Chen, National United Univ. (Taiwan); Ker Jer Huang, Chung-Shan Institute of Science and Technology (Taiwan); Chien-Chon Chen, National United Univ. (Taiwan) . . . . [9485-22]

Swap intensified WDR CMOS module for I2/LWIR fusion, Yang Ni, New Imaging Technologies (France) . . . . [9485-23]

Highly sensitive arrayed indium-antimony nanowires for infrared detection, Po-Chun Chen, National Chiao Tung Univ. (Taiwan); Chien-Chon Chen, National United Univ. (Taiwan); Shih-Hsun Chen, National Chiao Tung Univ. (Taiwan); Chung-Yi Chou, National United Univ. (Taiwan); Sheng-Jen Hsieh, Texas A&M Univ. (USA) . . . . [9485-24]

Computational methods for improving thermal imaging for consumer devices, Colm N. Lynch, National Univ. of Ireland, Galway (Ireland) and Tessera (FotoNation) Ireland Ltd. (Ireland); Nicholas Devaney, National Univ. of Ireland, Galway (Ireland); Alexandru Drimbarean, Tessera (FotoNation) Ireland Ltd. (Ireland) . . . . [9485-25]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:10 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition

SESSION 5 . . . . WED 1:00 PM TO 3:55 PM

NDT and Signal Processing

Session Chairs: **Steven M. Shepard,** Thermal Wave Imaging, Inc. (USA); **Vladimir P. Vavilov,** Tomsk Polytechnic Univ. (Russian Federation)

Pulsed thermal NDT in tables, figures and formulas *(Invited Paper)*, Vladimir P. Vavilov, Tomsk Polytechnic Univ. (Russian Federation); Douglas Burleigh, Surf Consulting (USA) . . . . [9485-26]

Advances in thermographic signal reconstruction *(Invited Paper)*, Steven M. Shepard, Thermal Wave Imaging, Inc. (USA) . . . . [9485-27]

Principal component analysis of thermographic data *(Invited Paper)*, William P. Winfree, K. Elliott Cramer, Joseph N. Zalameda, Patricia A. Howell, Eric R. Burke, NASA Langley Research Ctr. (USA). . . . . [9485-28]

Review of pulse phase thermography *(Invited Paper)*, Clemente Ibarra-Castanedo, P. Servais, Xavier Maldague, Univ. Laval (Canada) . . . . [9485-29]

Development of self-reference lock-in thermography and its applications to nondestructive testing *(Invited Paper)*, Takahide Sakagami, Kobe Univ. (Japan). . . . . [9485-30]

A novel data processing algorithm in thermal property measurement and defect detection by using one-sided active infrared thermography, Vladimir P. Vavilov, Tomsk Polytechnic Univ. (Russian Federation) . . . . [9485-31]

Signal and image processing techniques for testing and evaluation of glass fibre reinforced polymers, Ravibabu Mulaveesala, Indian Institute of Technology Ropar (India); Juned A. Siddiqui, Indian Institute of Information Technology (India); Vanita Arora, Indian Institute of Technology Ropar (India); Ghali V. Subbarao, PDPM Indian Institute of Information Technology, Design & Manufacturing Jabalpur (India) . . . . [9485-32]

SESSION 6 . . . . WED 3:55 PM TO 5:35 PM

NDT and Materials Evaluation I

Session Chairs: **Paolo Bison,** Consiglio Nazionale delle Ricerche (Italy); **Junko Morikawa,** Tokyo Institute of Technology (Japan)

Infrared thermography, ultrasound C-scan and microscope for non-destructive and destructive evaluation of 3D carbon fiber materials: a comparative study, Hai Zhang, Univ. Laval (Canada); Marc Genest, National Research Council Canada (Canada); Francois Robitaille, Univ. of Ottawa (Canada); Simon Joncas, École de Technologie Supérieure (Canada); Xavier Maldague, Univ. Laval (Canada); Catherine Leduc, École de Technologie Supérieure (Canada); Lucas West, Univ. of Ottawa (Canada). . . . . [9485-33]

Characterization of phononic heterostructures by infrared thermography, Dimitrios A. Exarchos, Ilias Tragazikis, Ioannis E. Psarobas, Theodore E. Matikas, Univ. of Ioannina (Greece) . . . . [9485-34]

Superimpose methods for uncooled infrared camera applied to the micro-scal thermal characterization of composite materials, Junko Morikawa, Tokyo Institute of Technology (Japan) . . . . [9485-35]

A numerical approach for testing and evaluation of mild steel material by thermal wave imaging, Ravibabu Mulaveesala, Geetika Dua, Indian Institute of Technology Ropar (India); Ghali V. Subbarao, K L Univ. (India) . . . . . . [9485-36]

Characterization of nuclear graphite elastic properties using laser ultrasonic methods, Fan W. Zeng, Karen Han, Lauren R. Olasov, James B. Spicer, Johns Hopkins Univ. (USA); Nidia C. Gallego, Cristian I. Contescu, Oak Ridge National Lab. (USA). . . . . [9485-37]

THURSDAY 23 APRIL

SESSION 7 . . . . THU 8:00 AM TO 10:00 AM

Manufacturing and Processing Industries

Session Chairs: **Andres E. Rozlosnik,** SI Termografía Infrarroja (Argentina); **Jian Chen,** Oak Ridge National Lab. (USA)

IR-based spot weld NDT in automotive applications, Jian Chen, Zhili Feng, Oak Ridge National Lab. (USA) . . . . [9485-38]

Laser beam welding quality monitoring system based in high-speed (10 kHz max) uncooled MWIR imaging sensors, Rodrigo Linares, Germán Vergara, Carlos Fernández, Luis Gómez, María González-Camino, Raúl Gutiérrez, María T. Montojo, Víctor Villamayor, Arturo Baldasano, New Infrared Technologies, S.L. (Spain). . . . . [9485-39]

Comparison of the insulation property of an innovative material and a traditional one by infrared thermography, Paolo Bison, Alessandro Bortolin, Gianluca Cadelano, Giovanni Ferrarini, Consiglio Nazionale delle Ricerche (Italy) . . . . [9485-40]

Thermographic investigation of luminescent barium borate glasses for white-LED applications, Florian Wagner, Fachhochschule Südwestfalen (Germany); Peter Nolte, Fraunhofer Application Ctr. for Inorganic Phosphors (Germany); Stefan Schweizer, Fachhochschule Südwestfalen (Germany) and Fraunhofer Application Ctr. for Inorganic Phosphors (Germany) . . . . . . [9485-41]

About infrared scanning of photovoltaic solar plant, Timo T. Kauppinen, P. E. Panouillot, Sami Siikanen, VTT Technical Research Ctr. of Finland (Finland); E. Athanasakou, P. Baltas, B. Nikopoulous, Euditi (Greece) . . [9485-42]

The TEMPS program at NIST and its implications for optical properties metrology of laser-matter interaction, Sergey Mekhontsev, Leonard M. Hanssen, Steven E. Grantham, Weston L. Tew, National Institute of Standards and Technology (USA). . . . . [9485-43]

SESSION 8 . . . . THU 10:30 AM TO 11:50 AM

NDT and Materials Evaluation II

Session Chairs: **Takahide Sakagami,** Kobe Univ. (Japan); **Fred P. Colbert,** Colbert Infrared Services, Inc. (USA)

Three-dimensional non-destructive testing (NDT) in the infrared spectrum, Moulay A. Akhloufi, Univ. Laval (Canada) and Ctr. of Robotics and Vision (Canada); Yannis Guyon, Univ. de Technologie de Belfort-Montbéliard (France); Abdelhakim Bendada, Clemente-Ibarra Castenado, Univ. Laval (Canada) . . . . [9485-44]

Thermographic inspection of external thermal insulation systems with mechanical fixing, Nuno A. Simões, Maria Simões, Catarina L. Serra, António Tadeu, Pólo II da Univ. de Coimbra (Portugal) . . . . [9485-45]

Thermal diffusivity estimation with quantitative pulsed phase thermography, Juan Esteban Ospina, Juan Felipe Florez, Hernan Dario Benitez, Pontificia Univ. Javeriana, Cali (Colombia) . . . . [9485-46]

Analysis of the relative merits of the 3–5 μm and the 8–12 μm spectral bands using detected thermal contrast, Sean M. Stewart, Nazarbayev Univ. (Kazakhstan) . . . . [9485-47]

Lunch Break and Exhibition Time . . . . Thu 11:50 am to 1:20 pm

SESSION 9 . . . . THU 1:20 PM TO 3:00 PM

Detection of Gas and Leaks

Session Chairs: **Vladimir P. Vavilov,** Tomsk Polytechnic Univ. (Russian Federation); **Richard Y. Chiou,** Drexel Univ. (USA)

Broadband, multispectral and hyperspectral thermal infrared imaging of gases: a systematic comparison, Alexandrine Huot, Marc-André Gagnon, Karl-Alexandre Jahjah, Pierre Tremblay, Simon Savary, Vincent Farley, Philippe Lagueux, Éric Guyot, Martin Chamberland, Telops (Canada). . . . . [9485-48]

Thermal imaging of microfluidic systems as a model for investigating energy efficiency, Richard Y. Chiou, Michael Mauk, Drexel Univ. (USA); Tzu-Liang B. Tseng, The Univ. of Texas at El Paso (USA) . . . . [9485-49]

Spectrum infrared transmission study of water spray, Zhongwei Chen, Li Zhang, Naval Academy of Armament (China) . . . . [9485-50]

Gas and flame detection and identification using uncooled MWIR imaging sensors, Rodrigo Linares, Germán Vergara, Carlos Fernández, Luis Gómez, María González-Camino, Raúl Gutiérrez, María T. Montojo, Víctor Villamayor, Arturo Baldasano, New Infrared Technologies, S.L. (Spain) . . . . [9485-51]

Detection of seal contamination in heat sealed food packaging based on active infrared thermography, Karlien D'huys, Wouter Saeys, Bart De Ketelaere, Katholieke Univ. Leuven (Belgium). . . . . [9485-52]

SESSION 10 . . . . THU 3:30 PM TO 4:50 PM

Biological/Medical Applications

Session Chairs: **Timo T. Kauppinen,** VTT Technical Research Ctr. of Finland (Finland); **Ralph A. Rotolante,** Vicon Infrared (USA)

Observation of temperature trace, induced by changing of temperature inside the human body, on the human body skin using commercially available IR camera, Vyacheslav A. Trofimov, Vladislav V. Trofimov, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9485-53]

Mass screening for infectious disease containment and pandemic outbreaks: misconceptions, Peter Leando, Compix Inc. (USA). . . . . . [9485-54]

3D medical thermography device, Peyman Moghadam, Commonwealth Scientific and Industrial Research Organisation (Australia). . . . . [9485-55]

Cow's body region detection using a visual approach on thermal images, Julien R. Fleuret, Univ. Laval (Canada) . . . . [9485-56]

AWARD CEREMONY AND BUSINESS MEETING. . . . . 4:50 PM TO 5:20 PM

Session Chairs: **Sheng-Jen Hsieh,** Texas A&M Univ. (USA); **Joseph N. Zalameda,** NASA Langley Research Ctr. (USA)

The Best Paper Award certificate and prize, a FLIR One thermal camera, will be presented.

Business meeting agenda items

1. Welcome new attendees
2. Present conference statistics (number of sessions, papers, attendees)
3. Nominations and voting for incoming co-chair for 2015
4. Discuss names to be added or dropped from steering committee membership. There will be a separate vote for each proposed change.
5. Welcome the incoming chair
6. Wrap up conference highlights of Thermosense XXXVII.

INTERACTIVE POSTER SESSION THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Distinguishability of sensor fault from system fault, Morteza Taiebat, Farrokh Sassani, The Univ. of British Columbia (Canada) . . . . [9485-57]

CONFERENCE 9486

Monday–Friday 20–24 April 2015 • Proceedings of SPIE Vol. 9486

Advanced Environmental, Chemical, and Biological Sensing Technologies XII

Conference Chairs: **Tuan Vo-Dinh,** Fitzpatrick Institute for Photonics, Duke Univ. (USA); **Robert A. Lieberman,** Lumoptix LLC (USA); **Günter G. Gauglitz,** Eberhard Karls Univ. Tübingen (Germany)

Program Committee: **Zane A. Arp,** GlaxoSmithKline (USA); **Francesco Baldini,** Istituto di Fisica Applicata Nello Carrara (Italy); **Luigi Campanella,** Univ. degli Studi di Roma La Sapienza (Italy); **Jesus Delgado Alonso,** Intelligent Optical Systems, Inc. (USA); **Franz Ludwig Dickert,** Univ. Wien (Austria); **Dennis K. Killinger,** Univ. of South Florida (USA); **Heinz-Detlef Kronfeldt,** Technische Univ. Berlin (Germany); **Robert Lascola,** Savannah River National Lab. (USA); **Edgar A. Mendoza,** Redondo Optics, Inc. (USA); **Anna Grazia Mignani,** Istituto di Fisica Applicata Nello Carrara (Italy); **Klaus Schäfer,** Karlsruher Institut für Technologie (Germany); **David L. Stokes,** EOIR Technologies (USA)

MONDAY 20 APRIL

SESSION 1. . . . . .MON 9:00 AM TO 10:00 AM

Biosensors I

Session Chair: **Tuan Vo-Dinh,**
Fitzpatrick Institute for Photonics, Duke Univ. (USA)

Highly sensitive detection of sulfadimidine in water and dairy products by using a planar waveguide evanescent wave biosensor, Lanhua Liu, Xiaohong Zhou, Weiqi Xu, Baodong Song, Hanchang Shi, Tsinghua Univ. (China) . [9486-1]

Detection of virus DNA by a surface-enhanced Raman scattering biosensor, Nianqiang Wu, West Virginia Univ. (USA). . . . . [9486-2]

iSERS: tissue-based cancer diagnostics using rationally designed plasmonic nanoparticles, Sebastian Schlücker, Yuying Zhang, Univ. Duisburg-Essen (Germany) . . . . [9486-3]

SESSION 2 . . . . MON 10:25 AM TO 11:45 AM

Biosensors II

Session Chair: **David L. Stokes,** EOIR Technologies (USA)

Label free impedance detection of different biomarkers using a nanobio sensor array, Rahim Esfandyarpour, Ronald W. Davis, Zahra Koochak, Stanford Univ. (USA) . . . . [9486-4]

Light-directed functionalization methods for high-resolution optical fiber based biosensors, Leyla N. Kahyaoglu, Rajtarun Madangopal, Jenna L. Rickus, Purdue Univ. (USA) . . . . [9486-5]

Plasmonic-biosilica SERS sensors for ultra-sensitive immuno-assay detection, Jing Yang, Le Zhen, Fanghui Ren, Gregory L. Rorrer, Alan X. Wang, Oregon State Univ. (USA) . . . . [9486-6]

Plasmonics-active gold nanostars for chemical and biological sensing using SERS detection, Yang Liu, Andrew M. Fales, Hsiangkuo Yuan, Tuan Vo-Dinh, Duke Univ. (USA). . . . . [9486-7]

Lunch Break . . . . .Mon 11:45 am to 1:15 pm

SESSION 3 . . . . .MON 1:15 PM TO 2:55 PM

Advanced Sensing Technologies

Session Chairs: **Bernd Sumpf,** Ferdinand-Braun-Institut (Germany); **Martin Maiwald,** Ferdinand-Braun-Institut (Germany)

Surface-enhanced Raman scattering sensors on guided-mode resonance gratings, Jing Yang, Xinyuan Chong, Fanghui Ren, Alan X. Wang, Oregon State Univ. (USA) . . . . [9486-8]

On-chip silicon photonic thermometers: from waveguide Bragg grating to ring resonators sensors, Nikolai N. Klimov, Sunil Mittal, National Institute of Standards and Technology (USA) and Univ. of Maryland, College Park (USA) and Joint Quantum Institute (USA); Michaela Berger, Zeeshan Ahmed, National Institute of Standards and Technology (USA). . . . . [9486-9]

Gold nanostars as building blocks for multiplexed chemical and biological sensing platforms, Laura Fabris, Rutgers, The State Univ. of New Jersey (USA); A. Swarnapali De Silva Indrasekara, Rice Univ. (USA) and Rutgers, The State Univ. of New Jersey (USA); Roney Thomas, Rutgers, The State Univ. of New Jersey (USA) . . . . [9486-10]

Mid-infrared opto-nanofluidics for label-free on-chip chemical sensing, Pao T. Lin, Massachusetts Institute of Technology (USA) . . . . [9486-11]

Shifted excitation surface-enhanced Raman difference spectroscopy for ex vivo sensing of plasmonic nanoprobes, Martin Maiwald, Ferdinand-Braun-Institut (Germany); Janna K. Register, Andrew M. Fales, Duke Univ. (USA); Götz Erbert, Günther Tränkle, Ferdinand-Braun-Institut (Germany); Tuan Vo-Dinh, Duke Univ. (USA); Bernd Sumpf, Ferdinand-Braun-Institut (Germany). . [9486-12]

SESSION 4 . . . . .MON 2:55 PM TO 5:00 PM

Chemical Sensing and Analysis

Session Chair: **Anna Grazia Mignani,**
Istituto di Fisica Applicata Nello Carrara (Italy)

Enabling optical polarization sensing methods with liquid crystals, Paul Searcy, Daniel Phipps, Erika Petrak, Chris A. Toomey, Thomas G. Baur, Meadowlark Optics, Inc. (USA) . . . . [9486-13]

Dispersive Raman spectroscopy excited at 1064nm to classify the botanic origin of honeys from calabria and quantify their sugar profile, Anna G. Mignani, Leonardo Ciaccheri, Andrea A. Mencaglia, Istituto di Fisica Applicata Nello Carrara (Italy); Rosa Di Sanzo, Sonia Carabetta, Maria Teresa Russo, Univ. Mediterranea di Reggio Calabria (Italy) . . . . [9486-14]

FTIR monitoring of methane from a local landfill, Scott W. Reeve, Tiffani Johnson, Arkansas State Univ. (USA) . . . . [9486-15]

Solutions for continuous in-situ pathlength calibration of integrating sphere based gas cells, Sarah Bergin, Jane Hodgkinson, Daniel Francis, Ralph P. Tatam, Cranfield Univ. (United Kingdom) . . . . [9486-16]

Real-time measurement of the NO2 concentration in ambient air using a multi-mode diode laser and cavity enhanced multiple line integrated absorption spectroscopy, Michael Fernez, Andreas Karpf, Gottipaty N. Rao, Adelphi Univ. (USA) . . . . [9486-17]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 5 . . . . TUE 8:30 AM TO 10:10 AM

Standoff Atmospheric Monitoring

Session Chair: **Robert A. Lieberman,** Lumoptix, LLC (USA)

Active stand-off detection of gas leaks using an open-path quantum cascade laser sensor in a backscatter configuration, Adrian Diaz, The City Univ. of New York (USA); Benjamin P. Thomas, NOAA-CREST (USA); Paulo C. Castillo, Brookhaven National Lab. (USA); Barry M. Gross, Fred Moshary, NOAA-CREST (USA) . . . . [9486-18]

Monitoring urban atmospheric ozone and ethylene remote sensing by infrared DIAL, Taieb Gasmi Cherifi, Saint Louis Univ. Madrid Campus (Spain) . . . . [9486-19]

Demonstration of aerosol and chemical cloud tracking using NIR DIAL (differential absorption lidar): PM2.5, CO_2 and CH4, Michael D. Wojcik, Space Dynamics Lab. (USA); Blake G. Crowther, Synopsys, Inc. (USA); Robert Lemon, Space Dynamics Lab. (USA); Zheng Yang, Quamrul Huda, Long Fu, Prasad Valupadas, AEMERA (Canada); Allan Chambers, Alberta Innovates Technology Futures (Canada) . . . . [9486-20]

Combined microphone array and lock-in amplifier operations for outdoor photo-acoustic sensing, Mohammad M. Islam, Univ. of Maryland, Baltimore County (USA); Joshua A. Lay, Univ. of Maryland, Baltimore (USA); Chen-Chia Wang, Sudhir B. Trivedi, Brimrose Corp. of America (USA); Jacob B. Khurgin, Johns Hopkins Univ. (USA); Fow-Sen Choa, Univ. of Maryland, Baltimore County (USA) . . . . [9486-21]

Standoff detection of trace chemicals with laser dispersion spectrometer, Michal P. Nikodem, Wroclaw Research Ctr. EIT+ (Poland) . . . . [9486-22]

SESSION 6 . . . . TUE 10:40 AM TO 12:00 PM

Sensing Methods and Enabling Technologies

Session Chair: **David L. Stokes,** EOIR Technologies (USA)

Microfluidics for spectrochemical applications, R. Shatford, D. Kim, Vassili Karanassios, Univ. of Waterloo (Canada) . . . . [9486-23]

Multispectral light scattering imaging and multivariate analysis of airborne particulates, Stephen Holler, Charles R. Skelsey, Fordham Univ. (USA); Stephen D. Fuerstenau, SDF Consulting (USA) . . . . [9486-24]

Universal optical platform for monitoring of bioprocess variables, Neha R. Sardesai, Govind Rao, Yordan Kostov, Univ. of Maryland, Baltimore County (USA) . . . . [9486-25]

Prediction of carp aggregation based on sensory data, Yu Liang, Chao Wu, The Univ. of Tennessee at Chattanooga (USA) . . . . [9486-26]

INTERACTIVE POSTER SESSION

TUESDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Polymethyl-methacrylate nanoparticles as carrier for theranostic agents into cells, Ambra Giannetti, Barbara Adinolfi, Istituto di Fisica Applicata Nello Carrara (Italy); Mario Pellegrino, Univ. di Pisa (Italy); Giovanna Sotgiu, Istituto per la Sintesi Organica e la Fotoreattività (Italy); Sara Tombelli, Cosimo Trono, Istituto di Fisica Applicata Nello Carrara (Italy); Greta Varchi, Istituto per la Sintesi Organica e la Fotoreattività (Italy); Francesco Baldini, Istituto di Fisica Applicata Nello Carrara (Italy) . . . . [9486-27]

Global nuclear radiation monitoring using plants, Mohammad M. Islam, Carlos Romero-Talamas, Yordan Kostov, Univ. of Maryland, Baltimore County (USA); Wanpeng Wang, Zhongchi Liu, Univ. of Maryland, College Park (USA); Daniel S. Hussey, Eli Baltic, David L. Jacobson, National Institute of Standards and Technology (USA); Fow-Sen Choa, Univ. of Maryland, Baltimore County (USA) . . . . [9486-28]

A plastic optical fiber biosensor for e. coli, Domingos M. C. Rodrigues, Regina C. S. B. Allil, Vanessa M. Queiroz, Rafaela N. Lopes, Marcelo M. Werneck, Univ. Federal of Rio de Janeiro (Brazil) . . . . [9486-29]

Fabrication and characterization of Pd nanocube-reduced graphene oxide composite based hydrogen sensor, Duy-Thach Phan, Gwiy Sang Chung, Univ. of Ulsan (Korea, Republic of) . . . . [9486-30]

Oil and gas deposits determination by ultraspectral lidar, Alexsandr S. Grishkanich, Alexsandr P. Zhevlakov, Sergey V. Kascheev, Victor G. Bespalov, National Research Univ. of Information Technologies, Mechanics and Optics (Russian Federation); Alexsandr A. Il'inskiy, All Russian Petroleum Research Exploration Institute (Russian Federation); Dmitriy V. Kosachiov, Gazprom (Russian Federation) . . . . [9486-31]

Lidar for monitoring methane hydrate in the arctic permafrost, Alexsandr S. Grishkanich, Alexsandr P. Zhevlakov, Sergey V. Kascheev, Victor G. Bespalov, Valentin V. Elizarov, National Research Univ. of Information Technologies, Mechanics and Optics (Russian Federation); Alexsandr Gusarov, Belgian Nuclear Research Ctr. (Belgium) . . . . [9486-32]

Monitoring radioactive contamination by hyperspectral lidar, Alexsandr S. Grishkanich, Alexsandr P. Zhevlakov, Sergey V. Kascheev, Valentin V. Elizarov, National Research Univ. of Information Technologies, Mechanics and Optics (Russian Federation); Alexsandr Gusarov, Belgian Nuclear Research Ctr. (Belgium); Sergey K. Vasiev, The State Atomic Energy Corp. ROSATOM (Russian Federation) . . . . [9486-33]

Chemical agent registration method on the basis of surface optical sensitization and surface plasmon resonance, Sergei Vinogradov, Michail Kononov, A. M. Prokhorov General Physics Institute (Russian Federation) . . . . [9486-34]

Fabrication and characterization of Ag/ZnO nanoparticles-reduced graphene oxide hybrid based acetylene sensor, A .S. M. Iftekhar Uddin, Gwiy Sang Chung, Univ. of Ulsan (Korea, Republic of) . . . . [9486-35]

Quality control in the recycling stream of PVC cable waste by hyperspectral imaging, Silvia Serranti, Valentina Luciani, Giuseppe Bonifazi, Univ. degli Studi di Roma La Sapienza (Italy) . . . . [9486-36]

FRIDAY 24 APRIL

SESSION 7 . . . . FRI 4:00 PM TO 6:00 PM

Laser Chemical Detection

Joint Session with Conferences 9467, 9455, 9486

Session Chair: **Michael K. Rafailov,** The Reger Group (USA)

Broadband mid-IR frequency comb source for standoff chemical detection *(Invited Paper)*, Konstantin L. Vodopyanov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9467-94]

Standoff trace detection of explosives with Infrared hyperspectral imagery *(Invited Paper)*, Frank Fuchs, Stefan Hugger, Jan-Philip Jarvis, Quankui K. Yang, Ralf Ostendorf, Christian Schilling, Wolfgang Bronner, Raschid Driad, Rolf Aidam, Joachim Wagner, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany) . . . . [9467-95]

Spectral shifted background references for QCL based mid infrared standoff spectroscopy *(Invited Paper)*, Charles W. Van Neste, Thomas G. Thundat, Univ. of Alberta (Canada) . . . . [9467-96]

Toward the realization of a compact chemical sensor platform using quantum cascade lasers *(Invited Paper)*, Ellen L. Holthoff, Paul M. Pellegrino, Logan S. Marcus, U.S. Army Research Lab. (USA) . . . . [9467-97]

Detection of trace explosives on relevant substrates using a mobile platform for photothermal infrared imaging spectroscopy (PT-IRIS) *(Invited Paper)*, Christopher A. Kendziora, Robert Furstenberg, Michael R. Papantonakis, Viet Nguyen, Jeff M. Byers, R. Andrew McGill, U.S. Naval Research Lab. (USA) . . . . [9467-98]

Standoff detection of chemical and biological threats using miniature widely tunable QCLs *(Invited Paper)*, Petros Kotidis, Erik R. Deutsch, Anish K. Goyal, Block Engineering, LLC (USA) . . . . [9467-99]

SESSION 8 . . . . .FRI 6:00 PM TO 7:00 PM

Quantum Cascade Lasers

Joint Session with Conferences 9467, 9455, 9486

Session Chair: **Michael K. Rafailov,** The Reger Group (USA)

Recent progress in quantum cascade external cavity laser systems optimized for mid-IR sensing applications *(Invited Paper)*, David B. Arnone, Leigh J. Bromley, David B. Caffey, William B. Chapman, Timothy Day, Allen Priest, Daylight Solutions Inc. (USA); Charles C. Harb, The Univ. of New South Wales (Australia) . . . . [9467-100]

Recent results on performance optimization of QCLs for consumption, spectral coverage and power *(Invited Paper)*, Antoine Müller, Richard Maulini, Stéphane Blaser, Alfredo Bismuto, Tobias Gresch, Romain Terazzi, Alpes Lasers SA (Switzerland) . . . . [9467-101]

High power MWIR quantum cascade lasers and their use in intra-cavity THz room temperature generation *(Invited Paper)*, Mariano Troccoli, AdTech Optics, Inc. (USA) . . . . [9467-102]

CONFERENCE 9487

Thursday–Friday 23–24 April 2015 • Proceedings of SPIE Vol. 9487

Smart Biomedical and Physiological Sensor Technology XII

Conference Chairs: **Brian M. Cullum,** Univ. of Maryland, Baltimore County (USA); **Eric S. McLamore,** Univ. of Florida (USA)

Program Committee: **Troy A. Alexander,** U.S. Army Research Lab. (USA); **Christopher Anton,** Episensors, Inc. (USA); **Karl S. Booksh,** Univ. of Delaware (USA); **Jonathan C. Claussen,** U.S. Naval Research Lab. (USA); **Mikella E. Farrell,** U.S. Army Research Lab. (USA); **Amethist S. Finch,** U.S. Army Research Lab. (USA); **Claudia Gärtner,** microfluidic ChipShop GmbH (Germany); **Christopher D. Geddes,** Univ. of Maryland, Baltimore (USA); **Ilko K. Ilev,** U.S. Food and Drug Administration (USA); **Douglas Kiehl,** Eli Lilly and Co. (USA); **T. Joshua Pfefer,** U.S. Food and Drug Administration (USA); **Noriko Satake,** UC Davis Medical Ctr. (USA); **Shiv K. Sharma,** Univ. of Hawai'i (USA); **Mohan Singh,** VBS Purvanchal Univ. (India); **Narsingh B. Singh,** Univ. of Maryland, Baltimore County (USA); **Ryan J. White,** Univ. of Maryland, Baltimore County (USA)

THURSDAY 23 APRIL

SESSION 1. . . . . THU 9:40 AM TO 11:20 AM

Advances in Microfluidic Analyses

Session Chairs: **Douglas Kiehl,** Eli Lilly and Co. (USA); **Claudia Gärtner,** microfluidic ChipShop GmbH (Germany)

Smartphone based paper/plastic hybrid microfluidic chemiluminescence sensor for nanomolar peroxide detection, Renny E. Fernandez, Elise Lebiga, Southern Methodist Univ. (USA); Mayank Ahuja, Plano East Senior High School (USA); Alexander Lippert, Ali Beskok, Southern Methodist Univ. (USA). . [9487-1]

Microsystem integrated immunosensor for the detection of the bioterrorist agent francisella tularensis, Ciara K. O'Sullivan, Univ. Rovira i Virgili (Spain) . . . . [9487-2]

Sensor enhanced microfluidic devices for cell based assays and organs on chip, Claudia Gärtner, Holger Becker, Ingo Schulz, Tobias Jahn, Cäcilia Freund, microfluidic ChipShop GmbH (Germany) . . . . [9487-3]

Integrated microsystem for multiplexed genosensor detection of biowarfare agents, Samuel Dulay, Univ. Rovira i Virgili (Spain); Rainer Gransee, Fraunhofer ICT-IMM (Germany); Sandra Julich, Herbert Tomaso, Friedrich-Loeffler-Institut (Germany); Ciara K. O'Sullivan, Univ. Rovira i Virgili (Spain) and Institució Catalana de Recerca i Estudis Avançats (Spain). . . . . [9487-4]

Ultrafast real-time PCR with integrated melting curve analysis and duplex capacities using a low-cost polymer lab-on-a-chip system, Rainer Gransee, Fraunhofer ICT-IMM (Germany); Tristan Schneider, Univ. of Applied Sciences Wiesbaden (Germany); Deniz Elyorgun, Fachhochschule Bingen (Germany); Tobias Schunck, Christian Winkler, Julian Hoeth, Fraunhofer ICT-IMM (Germany) . . . . [9487-5]

Lunch Break and Exhibition Time . . . . Thu 11:20 am to 1:10 pm

SESSION 2 . . . . THU 1:10 PM TO 2:50 PM

Electrochemical/ Electro-Luminescent Sensing

Session Chairs: **Claudia Gärtner,** microfluidic ChipShop GmbH (Germany); **Ryan J. White,** Univ. of Maryland, Baltimore County (USA)

Biocompatible, membrane coated electrochemical aptamer-based sensors for long-term monitoring in complex sample matrices, Lauren R. Schoukroun-Barnes, Ethan Glaser, Ryan J. White, Univ. of Maryland, Baltimore County (USA). . . . . [9487-6]

Rapid detection of listeria spp. using an internalin-a aptasensor based on carbon-metal nanohybrid structures, Diana C. Vanegas-Gamboa, Univ. of Florida (USA) and Univ. del Valle (Colombia); Yue Rong, Neil Schwalb, Univ. of Florida (USA); Katherine D. Hills, Carmen L. Gomes, Texas A&M Univ. (USA); Eric S. McLamore, Univ. of Florida (USA) . . . . [9487-7]

Electrochemical detection of francisella tularensis genomic DNA using solid-phase recombinase polymerase amplification, Ciara K. O'Sullivan, Univ. Rovira i Virgili (Spain) . . . . [9487-8]

ECL detection of francisella tularensis DNA target based on "switch-on-off" strategy with surface confinement of the system using diazonium salt as a molecular linker, Mabel Torrens, Mayreli Ortiz, Ciara K. O'Sullivan, Univ. Rovira i Virgili (Spain). . . . . [9487-9]

Electrochemiluminescence genosensor for multiplex detection of pathogen species, Ciara K. O'Sullivan, Univ. Rovira i Virgili (Spain) . . . . [9487-10]

SESSION 3 . . . . THU 3:20 PM TO 5:00 PM

Regulation and Monitoring

Session Chairs: **Douglas Kiehl,** Eli Lilly and Co. (USA); **T. Joshua Pfefer,** U.S. Food and Drug Administration (USA)

Dynamic analysis and performance evaluation of the BIAcore surface plasmon resonance biosensor, Juan F. Ospina, Univ. EAFIT (Colombia) . . . . [9487-11]

Implementation of a novel fiber-optic Fourier transform infrared (FO-FTIR) spectroscopy approach for non-contact and label-free sensing of biochemical contamination, Moinuddin Hassan, Elizabeth Gonzalez, Victoria M. Hitchins, Ilko K. Ilev, U.S. Food and Drug Administration (USA) . . . . [9487-12]

Process patent protection: protecting biopharmaceutical intellectual property via natural-abundance stable isotopes *(Invited Paper)*, John P. Jasper, Nature's Fingerprint (USA) and Molecular Isotope Technologies, LLC (USA) . . . . [9487-13]

Remote characterization of biological specimens using all-optical frequency-domain photoacoustic microscopy, Ashwin Sampathkumar, Riverside Research Institute (USA) . . . . [9487-14]

3D noninvasive, high-resolution imaging using a novel photoacoustic tomography system (pat) and rapid wavelength-cycling lasers, Ashwin Sampathkumar, Riverside Research Institute (USA); Marc Klosner, Gary Chan, Chunbai Wu, Donald F. Heller, Light Age, Inc. (USA) . . . . [9487-15]

INTERACTIVE POSTER SESSION

THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Speckle-correlation imaging through highly scattering turbid media with compressed sensing theory, Xiaopeng Shao, Weijia Dai, Tengfei Wu, Huijuan Li, Lin Wang, Xidian Univ. (China) . . . . [9487-33]

Imaging through turbid media via sparse representation: imaging quality comparison of three projection matrices, Xiaopeng Shao, Huijuan Li, Tengfei Wu, Weijia Dai, Lin Wang, Xidian Univ. (China). . . . . [9487-34]

A spectral method of color modeling and calibration for optical imaging systems, Rui Gong, Xiaopeng Shao, Lin Wang, Xidian Univ. (China); Xun Yu, Xun Yu, Baoyuan Liu, Xi'an Technological Univ. (China); Feng Han, Xi'an Univ. of Technology (China) . . . . [9487-35]

Leptospirosis risk depending on the distance to a potential source of infection, Erica Tatiana E. Loaiza Echeverri, Doracelly D. Hincapie-Palacio, Jesus J. Ochoa, Univ. de Antioquia (Colombia); Juan F. Ospina, Univ. EAFIT (Colombia) . . . . [9487-36]

Printing graphene-based inks on flexible substrates for biosensor applications, Jonathan C. Claussen, Iowa State Univ. (USA) . . . . [9487-37]

FRIDAY 24 APRIL

SESSION 4 . . . . FRI 8:20 AM TO 10:00 AM

Recent Developments in Biological SERS Sensing

Session Chairs: **Mikella E. Farrell,** U.S. Army Research Lab. (USA); **Ilko K. Ilev,** U.S. Food and Drug Administration (USA)

Flexible SERS-based substrates: challenges and opportunities toward an Army relevant universal sensing platform *(Invited Paper)*, Mikella E. Farrell, U.S. Army Research Lab. (USA); Srikanth Singamaneni, Washington Univ. in St. Louis (USA); Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . . [9487-16]

Surface-enhanced Raman scattering from living cells: from differentiating healthy and cancerous cell to cytotoxicity assessment *(Invited Paper)*, Mustafa Culha, Gamze Kuku, Melike Saricam, Sevda Mert, Yeditepe Univ. (Turkey) . . . . [9487-17]

Quantitative detection and SERS, Amanda J. Haes, The Univ. of Iowa (USA) . . . . [9487-18]

Functionalized paper SERS (P-SERS) substrates for selective targeting of analytes in complex samples, Wei W. Yu, Eric P. Hoppmann, Diagnostic anSERS, Inc. (USA) . . . . [9487-19]

Large area super-resolution chemical imaging via rapid dithering of a nanoprobe, Eric R. Languirand, Brian M. Cullum, Univ. of Maryland, Baltimore County (USA). . . . . [9487-20]

SESSION 5 . . . . FRI 10:20 AM TO 12:20 PM

Smart Materials for Biological and Biomedical Sensing

Session Chairs: **Jonathan C. Claussen,** U.S. Naval Research Lab. (USA); **Narsingh B. Singh,** Univ. of Maryland, Baltimore County (USA)

Bridgman growth of lead selenoiodide for multifunctional detectors, David House, Reecha Suri, Christopher Cooper, Brad Arnold, Fow-Sen Choa, Lisa Kelly, Univ. of Maryland, Baltimore County (USA); Liliana Braescu, Institut National de la Recherche Scientifique (Canada); Narsingh B. Singh, Univ. of Maryland, Baltimore County (USA) . . . . [9487-21]

Characterization of the role of oxide spacers in multilayer-enhanced SERS probes, Pietro Strobbia, Brian M. Cullum, Univ. of Maryland, Baltimore County (USA) . . . . [9487-22]

Optical nanosystems for biomolecular reaction studies *(Invited Paper)*, Jing Pan, Tae-Gon Cha, Jong Hyun Choi, Purdue Univ. (USA) . . . . [9487-23]

From materials science to next generation sensing using synthetic and engineered peptide technology *(Invited Paper)*, Dimitra N. Stratis-Cullum, U.S. Army Research Lab. (USA) . . . . [9487-24]

Enhancing enzymatic efficiency by attachment to semiconductor nanoparticles for biosensor applications *(Invited Paper)*, Joyce C. Breger, Scott Walper, Eunkeu Oh, Kimihiro Susumy, Michael H. Stewart, Jeffrey Deschamps, Mario G. Ancona, Igor L. Medintz, U.S. Naval Research Lab. (USA) . . . . [9487-25]

Structural reconfiguration of DNA origami *(Invited Paper)*, Haorong Chen, Feiran Li, Jong Hyun Choi, Purdue Univ. (USA) . . . . [9487-26]

Lunch Break . . . . Fri 12:20 pm to 1:50 pm

SESSION 6 . . . . FRI 1:50 PM TO 3:30 PM

Patient Based Monitoring

Session Chairs: **Noriko Satake,** UC Davis Medical Ctr. (USA); **Douglas Kiehl,** Eli Lilly and Co. (USA)

Automated calculation of bifurcation carotid angle for analyzing the risk of carotis plaques by using carotid ct angiographic images, Nusret Demir, Akdeniz Üniv. (Turkey); Serkan Demir, GATA Haydarpasa Training Military Hospital (Turkey) . . . . [9487-27]

Electroencephalograph (EEG) study of brain bistable illusionaaatest, Qinglei Meng, Univ. of Maryland, Baltimore County (USA); Elliot Hong, Univ. of Maryland, Baltimore (USA) and Univ. of Maryland School of Medicine (USA); Fow-Sen Choa, Univ. of Maryland, Baltimore County (USA) . . . . [9487-28]

Sensor probes and phantoms for advanced transcranial magnetic stimulation system developments, Qinglei Meng, Univ. of Maryland, Baltimore County (USA); Prashil Patel, Sudhir B. Trivedi, Brimrose Corp. of America (USA); Xiaoming Du, Elliot Hong, Univ. of Maryland, Baltimore (USA); Fow-Sen Choa, Univ. of Maryland, Baltimore County (USA) . . . . [9487-29]

A very low-cost 3D scanning system for whole-body imaging, Jeremy Straub, Scott Kerlin, Univ. of North Dakota (USA) . . . . [9487-30]

Smart clothing systems integrating contact and contactless sensors for vital signal continuous monitoring: a comparative analysis from integration and performance considerations, Isabel G. Trindade, Frederico Martins, Rui A. L. Miguel, Manuel Santos Silva, Univ. da Beira Interior (Portugal) . . . . [9487-31]

Mathematical modeling of Chikungunya fever control, Juan F. Ospina, Univ. EAFIT (Colombia). . . . . [9487-32]

CONFERENCE 9488

Tuesday–Wednesday 21–22 April 2015 • Proceedings of SPIE Vol. 9488

Sensing for Agriculture and Food Quality and Safety VII

Conference Chairs: **Moon S. Kim,** USDA Agricultural Research Service (USA); **Kuanglin Chao,** USDA Agricultural Research Service (USA); **Bryan A. Chin,** Auburn Univ. (USA)

Program Committee: **Arun K. Bhunia,** Ctr. for Food Safety Engineering, Purdue Univ. (USA); **Suming Chen,** National Taiwan Univ. (Taiwan); **Byoung-Kwan Cho,** Chungnam National Univ. (Korea, Republic of); **Stephen R. Delwiche,** USDA Agricultural Research Service (USA); **Ki-Bok Kim,** Korea Research Institute of Standards and Science (Korea, Republic of); **Naoshi Kondo,** Kyoto Univ. Graduate School of Agriculture (Japan); **Kurt C. Lawrence,** USDA Agricultural Research Service (USA); **Kangjin Lee,** National Academy of Agricultural Science (Korea, Republic of); **Alan M. Lefcourt,** USDA Agricultural Research Service (USA); **Changying (Charlie) Li,** The Univ. of Georgia (USA); **Renfu Lu,** USDA Agricultural Research Service (USA); **Bosoon Park,** USDA Agricultural Research Service (USA); **Yang Tao,** Univ. of Maryland, College Park (USA); **Yankun Peng,** China Agricultural Univ. (China); **Gang Yao,** Univ. of Missouri-Columbia (USA); **Haibo Yao,** Mississippi State Univ. (USA); **Yibin Ying,** Zhejiang Univ. (China); **Seung-Chul Yoon,** USDA Agricultural Research Service (USA)

TUESDAY 21 APRIL

SESSION 1. . . . . .TUE 1:00 PM TO 3:20 PM

Sensing for Food Quality and Safety I

Session Chairs: **Howard Clyde Wikle III,** Auburn Univ. (USA); **Christoph Bauer,** KWS Group (Germany)

Magnetostrictive particles used for biosensors for the detection of pathogen in liquid and their potential as a novel actuator *(Invited Paper)*, Kewei Zhang, Taiyuan Univ. of Science and Technology (China); ZhongYang Cheng, Auburn Univ. (USA) . . . . [9488-1]

High throughput pathogen screening for food safety using magnetoelastic biosensors *(Invited Paper)*, Suiqiong Li, Soochow Univ. (China); Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-2]

Detection of heavy metals with graphene-based biosensors, Nick Wu, West Virginia Univ. (USA) . . . . [9488-3]

In-situ detection of multiple pathogenic bacteria on food surfaces, Yating Chai, Shin Horikawa, Howard C. Wikle III, Auburn Univ. (USA); Jiajia Hu, Changzhou Univ. (China); Steve R. Best, Bryan A. Chin, Jing Dai, Auburn Univ. (USA) . . . . [9488-4]

Application of a LED-based reflectance sensor for the in situ assessment of lycopene content in tomatoes, Anna G. Mignani, Leonardo Ciaccheri, Andrea A. Mencaglia, Lorenza Tuccio, Giovanni Agati, Istituto di Fisica Applicata Nello Carrara (Italy) . . . . [9488-5]

Detection of salmonella of globe fruits using pulse excited magnetoelastic biosensors, Howard C. Wikle III, Songtao Du, Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-6]

SESSION 2 . . . . TUE 3:50 PM TO 5:30 PM

Sensing for Food Quality and Safety II

Session Chair: **Suiqiong Li,** Auburn Univ. (USA)

Bioenabled nanophotonic sensors for food safety and drinking water monitoring, Alan X. Wang, Jing Yang, Gregory L. Rorrer, Oregon State Univ. (USA) . . . . [9488-7]

Optimization of phage-based magnetoelastic biosensor to detect salmonella on bird feces contaminated leafy green vegetables, Jing Dai, Auburn Univ. (USA); Jiajia Hu, Changzhou Univ. (China); Yating Chai, Shin Horikawa, Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-8]

Electronic nose fabricated from nanocomposite oxides for agriculture applications, Dong-Joo Kim, Hyejin Park, Eunji Lee, Yoonsung Chung, Seok Hee Lee, Auburn Univ. (USA); Hosang Ahn, Korea Institute of Construction Technology (Korea, Republic of); Young Soo Yoon, Gachon Univ. (Korea, Republic of) . . . . [9488-9]

A biosensor based on magnetic resonance relaxation, MariAnne Sullivan, Barton C. Prorok, Auburn Univ. (USA) . . . . [9488-11]

Nature-inspired magnetoelastic biosentinels for the detection of pathogenic bacteria in stagnant liquids, Shin Horikawa, Yating Chai, Howard C. Wikle III, Jing Dai, Jiajia Hu, Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-12]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Detection of salmonella typhimurium in fecal contaminants on fresh produce using phase-based magnetoelastic biosensors, Jiajia Hu, Changzhou Univ. (China) and Auburn Univ. (USA); Jing Dai, Yating Chai, Shin Horikawa, Auburn Univ. (USA); Jing Hu, Changzhou Univ. (China); Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-10]

Rapid detection of foodborne pathogens in pork meat by surface-enhanced Raman scattering, Feifei Tao, Yankun Peng, China Agricultural Univ. (China) . . . . [9488-26]

Research on identification and determination of mixed pesticides in apples using surface enhanced Raman spectroscopy, Chen Zhai, Yankun Peng, Yongyu Li, Sagar Dhakal, Tianfeng Xu, China Agricultural Univ. (China) [9488-27]

Rapid detection of benzoyl peroxide added in wheat flour by using Raman scattering spectroscopy, Juan Zhao, Yankun Peng, China Agricultural Univ. (China); Kuanglin Chao, Jianwei Qin, Agricultural Research Service (USA); Sagar Dhakal, China Agricultural Univ. (China) . . . . [9488-28]

Nondestructive detection of pork quality based on dual-band VIS/NIR spectroscopy, Wenxiu Wang, Yankun Peng, Yuanyuan Liu, China Agricultural Univ. (China) . . . . [9488-29]

Depth of penetration of a 785nm wavelength laser in milk powder, Kuanglin Chao, Sagar Dhakal, Jianwei Qin, Moon S. Kim, Agricultural Research Service (USA); Yankun Peng, China Agricultural Univ. (China); Walter F. Schmidt, Agricultural Research Service (USA) . . . . [9488-30]

Rapid detection of salmonella typhimurium through improvements to magnetoelastic biosensors, Zhou Tong, Shin Horikawa, Bryan A. Chin, Auburn Univ. (USA); Laura A. Silo-Suh, Mercer Univ. (USA); Sang-Jin Suh, Auburn Univ. (USA) . . . . [9488-31]

Corrosion of magnetostrictive biosensors, Jiajia Hu, Changzhou Univ. (China) and Auburn Univ. (USA); Jing Hu, Changzhou Univ. (China); Yating Chai, Shin Horikawa, Bryan A. Chin, Auburn Univ. (USA) . . . . [9488-32]

Determination of the optimal analytical conditions for quickly detecting feces to cause contamination of potential pathogens in the field of agriculture using hyperspectral imaging, Hyunjeong Cho, Sungyoun Kim, Dongho Kim, Byuncheon Kim, Byunglim Cho, NAQS (Korea, Republic of) . . . . [9488-33]

Development of a quality monitoring method for Korean traditional rice wine 'makgeolli' using near-infrared spectroscopy, Dae Yong Kim, Kyungdo Kwon, Byoung-Kwan Cho, Chungnam National Univ. (Korea, Republic of) . . . . [9488-34]

Hyperspectral fluorescence imaging with violet LED excitation for monitoring drought stress effect on soybean plants, Changyeun Mo, National Academy of Agricultural Science (Korea, Republic of); Moon S. Kim, Agricultural Research Service (USA); Giyoung Kim, Jongguk Lim, National Academy of Agricultural Science (Korea, Republic of); Eunju Cheong, Jinyoung Barnaby, Agricultural Research Service (USA); Hyun-jeong Cho, NAQS (Korea, Republic of) . . . . [9488-35]

Multispectral imaging for browning detection of fresh-cut lettuce, Changyeun Mo, Giyoung Kim, Jongguk Lim, National Academy of Agricultural Science (Korea, Republic of); Byoung-Kwan Cho, Chungnam National Univ. (Korea, Republic of); Moon S. Kim, Agricultural Research Service (USA) . . . . [9488-36]

Hyperspectral imaging for contaminant detection in starch, Min Huang, Jiangnan Univ. (China) and Agricultural Research Service (USA); Moon S. Kim, Kuanglin Chao, Jianwei Qin, Agricultural Research Service (USA); Qibing Zhu, Jiangnan Univ. (China). . . . . [9488-37]

Production of an innovative fertilizer from organic waste: process monitoring by hyperspectral imaging, Silvia Serranti, Giuseppe Bonifazi, Andrea Fabbri, Univ. degli Studi di Roma La Sapienza (Italy); Alice Dall'Ara, ENEA (Italy); Carlos Garcia Izquierdo, CEBAS-CSIC (Spain) . . . . [9488-38]

Prediction of soluble solids content spatial distribution in apple using hyperspectral imaging and variable selection algorithms, Wenqian Huang, Liping Chen, Jiangbo Li, Zhiming Guo, National Research Ctr. of Intelligent Equipment for Agriculture (China) . . . . [9488-47]

WEDNESDAY 22 APRIL

SESSION 3 . . . . WED 8:40 AM TO 10:00 AM

Raman for Food Quality and Safety

Session Chair: **Kuanglin Chao,**
USDA gricultural Research Service (USA)

Second derivative analyses of temperature dependent Raman spectroscopy, Walter F. Schmidt, Leigh Broadhurst, Jianwei Qin, Kuanglin Chao, Daniel Shelton, Moon S. Kim, Agricultural Research Service (USA) . . . . [9488-13]

Dry mixture preparation by resonant acoustic mixing for Raman-spectroscopy-based contaminant detection, Sagar Dhakal, Kuanglin Chao, Jianwei Qin, Moon S. Kim, Agricultural Research Service (USA) . . . . . . [9488-14]

Screening of adulterants in powdered foods and ingredients using line-scan Raman chemical imaging, Jianwei Qin, Kuanglin Chao, Moon S. Kim, Agricultural Research Service (USA) . . . . [9488-15]

Shifted excitation Raman difference spectroscopy: a potential tool for outdoor measurements in precision agriculture, Martin Maiwald, André Müller, Ferdinand-Braun-Institut (Germany); Jörn Selbeck, Jana Käthner, Manuela Zude, Leibniz-Institut für Agrartechnik Potsdam-Bornim e.V. (Germany); Dominique Fleury, Univ. of Applied Sciences at Changins (Switzerland); Bernd Sumpf, Götz Erbert, Günther Tränkle, Ferdinand-Braun-Institut (Germany) . . . . [9488-16]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 4 . . . . WED 1:20 PM TO 3:00 PM

Hyperspectral Imaging for Foods

Session Chairs: **Christoph Bauer,** KWS Group (Germany);
Seung-Chul Yoon, USDA Agricultural Research Service (USA)

Color-based hyperspectral imaging for safety inspection of poultry carcasses, Seung-Chul Yoon, Kurt C. Lawrence, Bosoon Park, Gary R. Gamble, Tae-Sung Shin, Gerald W. Heitschmidt, Agricultural Research Service (USA) . . . . [9488-17]

Chemometric analysis for near-infrared spectral detection of beef in fish meal, Chun-Chieh Yang, Agricultural Research Service (USA); Cristóbal Garrido-Novell, Dolores Pérez-Marín, José E. Guerrero-Ginel, Ana Garrido-Varo, Univ. de Córdoba (Spain); Moon S. Kim, Agricultural Research Service (USA) . . . . [9488-18]

Application of hyperspectral imaging and spectral similarity analysis for intramuscular fat quantification in beef, Santosh Lohumi, Sangdae Lee, Byoung-Kwan Cho, Chungnam National Univ. (Korea, Republic of) . . . [9488-19]

The use of short wave infrared hyperspectral imaging for discrimination of watermelon seed infestation by acidovorax citrulli, Hoonsoo Lee, Chungnam National Univ. (Korea, Republic of) . . . . [9488-20]

Spectroscopic techniques for examination of toxic metabolites in maize kernels, Lalit Mohan Kandpal, Hyun-Jung Min, Byoung-Kwan Cho, Chungnam National Univ. (Korea, Republic of) . . . . [9488-21]

SESSION 5 . . . . WED 3:30 PM TO 4:50 PM

Spectral Imaging for Foods

Session Chair: **Seung-Chul Yoon,**
USDA Agricultural Research Service (USA)

Classification of corn kernels inoculated with aspergillus flavus using fluorescence and reflectance visible near-infrared (VNIR) hyperspectral imaging, Fengle Zhu, Haibo Yao, Zuzana Hruska, Russell Kincaid, Mississippi State Univ. (USA); Robert L. Brown, Deepak Bhatnagar, Thomas E. Cleveland, U.S. Dept. of Agriculture (USA) . . . . [9488-22]

Discrimination of varieties of pear based on Vis/NIR spectroscopy and BP-ANN, Jiangbo Li, National Engineering Research Ctr. for Information Technology in Agriculture (China) . . . . [9488-23]

Using NOAA/AVHRR based remote sensing data and PCR method for estimation of Aus rice yield in Bangladesh, Mohammad Nizamuddin, The City College of New York (USA); Kawsar A. Akhand, The City Univ. of New York (USA); Leonid Roytman, The City College of New York (USA); Felix Kogan, Mitchell Goldberg, National Environmental Satellite, Data, and Information Service (USA). . . . . [9488-24]

Qualitative identification of green tea origin by near infrared spectroscopy and multivariatecalibration, Xingang Zhuang, Lili Wang, Jiaxiong Fang, Shandong Univ. (China); Xueyuan Wu, State Key Lab. of Tea and Agricultural Products Detection (China) . . . . [9488-25]

CONFERENCE 9489

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9489

Dimensional Optical Metrology and Inspection for Practical Applications IV

Conference Chairs: **Kevin G. Harding,** GE Global Research (USA); **Toru Yoshizawa,** NPO 3D Associates (Japan)

Conference Co-Chair: **Song Zhang,** Iowa State Univ. (USA)

Program Committee: **Yasuhiko Arai,** Kansai Univ. (Japan); **Anand Krishna Asundi,** Nanyang Technological Univ. (Singapore); **Khaled J. Habib,** Kuwait Institute for Scientific Research (Kuwait); **Katsuichi Kitagawa,** Consultant (Japan); **Peter Kühmstedt,** Fraunhofer-Institut für Angewandte Optik und Feinmechanik (Germany); **Georges T. Nehmetallah,** The Catholic Univ. of America (USA); **Yukitoshi Otani,** Utsunomiya Univ. (Japan); **Xianyu Su,** Sichuan Univ. (China); **Takamasa Suzuki,** Niigata Univ. (Japan); **Joseph D. Tobiason,** Micro Encoder Inc. (USA); **Jiangtao Xi,** Univ. of Wollongong (Australia)

MONDAY 20 APRIL

SESSION 1. . . . . MON 8:30 AM TO 10:00 AM

Metrology Analysis

Session Chair: **Toru Yoshizawa,** NPO 3D Associates (Japan)

3D range data compression with a virtual fringe projection system *(Invited Paper)*, Song Zhang, Iowa State Univ. (USA) . . . . [9489-1]

Phase unwrapping of fringe images for dynamic 3D measurements without additional pattern projection, Andreas Breitbarth, Eric Müller, Peter Kühmstedt, Gunther Notni, Fraunhofer-Institut für Angewandte Optik und Feinmechanik (Germany); Joachim Denzler, Friedrich-Schiller-Univ. Jena (Germany) . . . . [9489-2]

Experimental verification of reconstruction of two interfering wavefronts using the transport of intensity equation, Ahmad Darudi, Javad Amiri, Peyman Soltani, Univ. of Zanjan (Iran, Islamic Republic of); Georges T. Nehmetallah, The Catholic Univ. of America (USA). . . . . [9489-3]

Geometric and topological feature extraction of linear and circular segments from 2D cross-section data of 3D point clouds, Rajesh Ramamurthy, Yi Liao, Ratnadeep Paul, Kevin G. Harding, GE Global Research (USA) . . . . [9489-4]

SESSION 2 . . . . MON 10:30 AM TO 12:00 PM

3D Applications

Session Chair: **Song Zhang,** Iowa State Univ. (USA)

Inner profile measurement probe: from a pipe to an underground cavity *(Invited Paper)*, Toru Yoshizawa, NPO 3D Associates (Japan); Toshitaka Wakayama, Saitama Medical Univ. (Japan) . . . . [9489-5]

Development of feature extraction analysis for a multi-functional optical profiling device applied to field engineering applications, Kevin G. Harding, GE Global Research (USA); Xu Han, Guangping Xie, GE Global Research (China); Brandon Laflen, GE Global Research (USA); Ming Jia, GE Global Research (China) . . . . [9489-6]

Composite layup monitoring using structured light, Robert W. Tait, Kevin G. Harding, Christopher Nafis, GE Global Research (USA) . . . . . . [9489-7]

Characterization of 3D printing output using an optical sensing system, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9489-8]

Lunch Break . . . . .Mon 12:00 pm to 1:10 pm

SESSION 3 . . . . .MON 1:10 PM TO 2:10 PM

Metrology for Additive Manufacturing

Session Chair: **Edward W. Reutzel,** Applied Research Lab. (USA)

Sensors for modern manufacturing: certify as you build *(Invited Paper)*, Jyoti Mazumder, Lijun Song, Univ. of Michigan (USA) . . . . [9489-9]

A brief survey of sensing for additive manufacturing *(Invited Paper)*, Edward W. Reutzel, Abdalla R. Nassar, Applied Research Lab. (USA). . [9489-10]

PANEL DISCUSSION. . . . . 2:10 PM TO 3:30 PM

Metrology for Additive Manufacturing

Moderator: **Edward W. (Ted) Reutzel,** Applied Research Lab. (USA)

Panelists: **Doug Rhoda,** Wolf Robotics (USA);
Radovan Kovacevic, Southern Methodist Univ. (USA);
Shawn Kelly, Edison Welding Institute (USA);
Jyoti Mazumder, Univ. of Michigan (USA);
Edward Herderick, GE Corporate (USA)

Process sensing plays an increasingly important role in a wide range of manufacturing processes, both to enable rapid assessment of quality and to provide critical data to real time control systems. Advanced sensors and exploding computational capability afford (i) practitioners, (ii) equipment suppliers, and (iii) researchers unprecedented opportunities to collect and analyze complex sensor data to ensure quality product.

This panel discussion brings together leaders representing these three communities to discuss sensing and control for laser, electron beam, and arc-based welding, metal deposition, and additive manufacturing processes. The current state-of-the-art, current research, issues, and opportunities will be explored.

SESSION 4 . . . . MON 4:00 PM TO 5:00 PM

Advanced Topics

Session Chair: **Yukitoshi Otani,** Utsunomiya Univ. (Japan)

Thickness and air gap measurement of assembled IR objectives, Bernd Lueerss, Patrik Langehanenberg, TRIOPTICS GmbH (Germany). . . . . . [9489-11]

Method for controlling a laser additive process using intrinsic illumination, Guoshuang Cai, Robert W. Tait, Sudhir Tewari, Magdi N. Azer, Xiaobin Chen, David Abbot, Yong Liu, Kevin G. Harding, GE Global Research (USA) . [9489-12]

The impact of oceanic gravity waves on laser propagation, Serdar Kizilkaya, Cumhuriyet Mah. (Turkey); Timothy Kane, The Pennsylvania State Univ. (USA) . . . . [9489-13]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 5 . . . . TUE 8:30 AM TO 12:10 PM

3D and Imaging Methods

Session Chair: **Kevin G. Harding,** GE Global Research (USA)

Measuring accuracy of in-plane and out-of-plane deformations simultaneous measurement of speckle interferometry using multi-recording method *(Invited Paper)*, Yasuhiko Arai, Kansai Univ. (Japan). . . . . [9489-14]

Long wave infrared 3D scanner, Ernst Wiedenmann, Robert Schott, Jan Tusch, Andreas Wolf, Aimess Services GmbH (Germany). . . . . [9489-15]

Terahertz reflection interferometry for automobile paint layer thickness measurement, Aunik K. Rahman, Applied Research & Photonics, Inc. (USA); Kenneth B. Tator, KTA-Tator, Inc. (USA); Anis Rahman, Applied Research & Photonics, Inc. (USA) . . . . [9489-16]

Quantitative imaging of open-circuit voltage in opto-electronic devices with nanoscale resolution, Elizabeth Tennyson, Joseph Garrett, Univ. of Maryland, College Park (USA); Jesse A. Frantz, Jason D. Myers, Robel Y. Bekele, U.S. Naval Research Lab. (USA); Jasbinder S. Sanghera, Univ. Research Foundation (USA) and U.S. Naval Research Lab. (USA); Jeremy N. Munday, Marina S. Leite, Univ. of Maryland, College Park (USA) . . . . [9489-17]

Application of holographic interferometry to in-plane and out-of-plane misalignment and deformation measurements in packaging applications, Vladimir V. Nikulin, Rahul M. Khandekar, Vijit Bedi, Binghamton Univ. (USA) . . . . [9489-18]

Real-time and uniaxial microscopic measurement of 3D profile by polarization grating, Yukitoshi Otani, Shuhei Shibata, Daisuke Barada, Utsunomiya Univ. (Japan) . . . . [9489-19]

3D position tracking for borescope inspections, Kevin G. Harding, GE Global Research (USA); Yong Yang, GE Global Research (China); Guiju Song, GE Global Research (USA) . . . . [9489-20]

Small hole inner profile measurement method, Yi Liao, Kevin G. Harding, Rajesh Ramamurthy, GE Global Research (USA) . . . . [9489-21]

High contrast imaging in the presence of a bright background, Harbans S. Dhadwal, Jahangir Rastegar, Dake Feng, Omnitek Partners, LLC (USA) . . . . [9489-22]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

The omni-directional image assisted optical surveillance system, Yung-Hsiang Chen, National Applied Research Labs. (Taiwan) and National Tsing Hua Univ. (Taiwan); Chi-Hung Hwang, National Applied Research Labs. (Taiwan); Wei-Chung Wang, National Tsing Hua Univ. (Taiwan); Chun-Fu Lin, National Applied Research Labs. (Taiwan) . . . . [9489-23]

CONFERENCE 9490

Monday 20 April 2015 • Proceedings of SPIE Vol. 9490

Advances in Global Health through Sensing Technologies 2015

Conference Chair: **Šárka O. Southern,** Gaia Medical Institute (USA)

Conference Co-Chairs: **Isaac R. Rodriguez-Chavez,** National Institute of Dental and Craniofacial Research (USA); **Claudia Gärtner,** microfluidic ChipShop GmbH (Germany); **Jonathan D. Stallings,** U.S. Army Ctr. for Environmental Health Research (USA)

Program Committee: **James Delehanty,** U.S. Naval Research Lab. (USA); **Theresa G. Evans-Nguyen,** Draper Lab. (USA); **Peter Kiesel,** Palo Alto Research Ctr., Inc. (USA); **Baochuan Lin,** U.S. Naval Research Lab. (USA); **Daniel Malamud,** New York Univ. (USA); **Igor Medintz,** U.S. Naval Research Lab. (USA); **Richard M. Ozanich,** Pacific Northwest National Lab. (USA); **Ava M. Puccio,** Univ. of Pittsburgh Medical Ctr. (USA); **Steven A. Ripp,** The Univ. of Tennessee (USA); **Albert Skip Rizzo III,** The Univ. of Southern California (USA); **Kim E. Sapsford,** U.S. Food and Drug Administration (USA); **Shadrian B. Strong,** Johns Hopkins Univ. Applied Physics Lab. (USA); **David E. Wolf,** Radiation Monitoring Devices, Inc. (USA); **Aurel Ymeti,** Ostendum R&D BV (Netherlands); **Leah Ziph-Schatzberg,** Corning NetOptix (USA)

MONDAY 20 APRIL

SESSION 1. . . . . MON 8:00 AM TO 10:30 AM

Advances in Global Health I

Session Chairs: **Isaac R. Rodriguez-Chavez,** National Institute of Dental and Craniofacial Research (USA); **Šarka O. Southern,** Gaia Medical Institute (USA)

Non-invasive disease diagnostics based on oral biospecimens: lessons learned and future directions *(Invited Paper)*, Isaac R. Rodriguez-Chavez, National Institute of Dental and Craniofacial Research (USA). . . . . [9490-1]

The human saliva proteome: overview and emerging methods for characterization *(Invited Paper)*, Timothy J. Griffin, Univ. of Minnesota (USA) . . . . [9490-2]

Comparison between oral and salivary diagnostics *(Invited Paper)*, J. Marques, Univ. de Lisbon (Portugal); Patricia Corby, C. Barber, William R. Abrams, New York Univ. College of Dentistry (USA); Daniel Malamud, New York Univ. (USA) . . . . [9490-3]

Saliva fluid considerations in oral diagnostics, Eva J. Helmerhorst, Boston Univ. (USA) . . . . [9490-4]

Addressing the challenges of system integration for non-invasive diagnostics, Vincent Gau, Genefluidics (USA). . . . . [9490-5]

Saliva-based molecular diagnostics of HPV, Jennifer Webster-Cyriaque, The Univ. of North Carolina at Chapel Hill (USA); William Seaman, Univ. of North Carolina at Chapel Hill (USA). . . . . [9490-6]

Next Generation saliva diagnostics: host response biomarkers for HIV diagnostics,Šarka O. Southern, Gaia Medical Institute (USA); Jennifer Webster-Cyriaque, The Univ. of North Carolina at Chapel Hill (USA); Martin Gleeson, Genalyte, Inc. (USA) . . . . [9490-7]

SESSION 2 . . . . MON 10:45 AM TO 12:30 PM

Advances in Global Health II

Session Chairs: **Jonathan D. Stallings,** U.S. Army Ctr. for Environmental Health Research (USA); **Utkan Demirci,** Stanford Univ. School of Medicine (USA)

Early predictive markers of organ injury and toxicity *(Invited Paper)*, Danielle L. Ippolito, U.S. Army Ctr. for Environmental Health Research (USA); Mohamed D. M. AbdulHameed, Gregory J. Tawa, BHSAI (USA); John A. Lewis, U.S. Army Ctr. for Environmental Health Research (USA); Christine E. Baer, EXCET, Inc. (USA); Bonna C. Donald, Oak Ridge Institute for Science and Education (USA); Anders Wallqvist, BHSAI (USA); Jonathan D. Stallings, U.S. Army Ctr. for Environmental Health Research (USA) . . . . [9490-8]

Detecting biotargets and drugs from blood, urine and saliva *(Invited Paper)*, Utkan Demirci, Stanford Univ. School of Medicine (USA). . . . . [9490-9]

Imaging-based rapid test and assay reader with trans-visual sensitivity, Onur Mudanyali, Neven Karlovac, Holomic (USA) . . . . [9490-10]

Multiplex on-chip detection of pathogen biomarkers in human saliva using silicon photonic microring resonators, Martin A. Gleeson, Genalyte, Inc. (USA) . . . . [9490-11]

Optical biosensor technologies for molecular diagnostics at the point-of-care, Joerg M. Schotter, Stefan Schrittwieser, Paul Muellner, Eva Melnik, Rainer Hainberger, AIT Austrian Institute of Technology GmbH (Austria); Guenther Koppitsch, Franz Schrank, ams AG (Austria); Katerina Soulantika, Sergio Lentijo-Mozo, Institut National des Sciences Appliquées de Toulouse (France) and Lab. de Photonique et de Nanostructures, CNRS, Univ. de Toulouse (France); Beatriz Pelaz, Wolfgang J. Parak, Philipps-Univ. Marburg (Germany); Frank Ludwig, Jan Dieckhoff, Technische Univ. Braunschweig (Germany) . . . . [9490-12]

Lunch Break . . . . .Mon 12:30 pm to 1:30 pm

SESSION 3 . . . . MON 1:30 PM TO 5:00 PM

Advances in Global Health III

Session Chairs: **Claudia Gärtner,** microfluidic ChipShop GmbH (Germany); **Amy E. Herr,** Univ. of California, Berkeley (USA)

Microfluidic design for next-generation diagnostics *(Invited Paper)*, Amy E. Herr, Univ. of California, Berkeley (USA) . . . . [9490-13]

Lab-on-a-chip enabled HLA diagnostic: combined sample preparation and real time PCR for HLA-b27 diagnosis *(Invited Paper)*, Claudia Gärtner, Holger Becker, Richard Klemm, Sebastian Schattschneider, Nadine Hlawatsch, Christian Moche, microfluidic ChipShop GmbH (Germany); Rainer Frank, Andreas Willems, Inno-Train Diagnostik GmbH (Germany) . . . . [9490-14]

Microchip technologies for HIV management in developed and developing countries, Hadi Shafiee, Brigham and Women's Hospital (USA). . . . . . [9490-15]

Rapid detection of ebola virus in immunofiltration lab on chip system, Peter Miethe, fzmb GmbH (Germany); Claudia Gärtner, microfluidic ChipShop GmbH (Germany); Dominik Gary, fzmb GmbH (Germany); Nadine Hlawatsch, microfluidic ChipShop GmbH (Germany) . . . . [9490-16]

Low cost molecular diagnostics for cancer and infectious disease, Catherine Klapperich, Boston Univ. (USA) . . . . [9490-17]

PANDAA: rapid, sensitive detection of highly polymorphic pathogens and quantification of drug resistance, Iain J. MacLeod, Harvard School of Public Health (USA) and Botswana-Harvard AIDS Institute (Botswana) and Aldatu Biosciences (USA); Christopher F. Rowley, Harvard School of Public Health (USA) and Botswana-Harvard AIDS Institute (Botswana) and Beth Israel Deaconess Medical Ctr. (USA); David M. Raiser, Aldatu Biosciences (USA); M. Essex, Harvard School of Public Health (USA) and Botswana-Harvard AIDS Institute (Botswana). . . . . [9490-18]

Next generation DNA, Steven Albert Benner, The Westheimer Institute for Science and Technology (USA). . . . . [9490-19]

Developing targeted immunotherapies and vaccines against difficult to treat infectious diseases, Frank Jones, Elizabeth Gabitzsch, Etubics Corp. (USA) . . . . [9490-20]

Nanopore sensing technology for single molecule and single cell analysis, MinJun Kim, Drexel Univ. (USA) . . . . [9490-21]

Homogeneous biochemiluminescence assays for point of care use, X. James Li, Cellex, Inc. (USA) . . . . [9490-22]

Advances in global health through sensing technologies, Jonathan C. Claussen, Iowa State Univ. (USA) . . . . [9490-23]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Differential excitation spectroscopy for detection of industrial chemicals: benzene and chlorinated solvents, Boyd V. Hunter, Jason M. Cox, Kestrel Corp. (USA); Michael A. Miller, Robert A. McIntosh, Southwest Research Institute (USA); Paul Harrison, William P. Walters, Kestrel Corp. (USA) . [9490-24]

Advancing innovative regulatory science and public health through CDx: FDA's development of a counterfeit detection tool, Leigh Verbois, U.S. Food and Drug Administration (USA) . . . . [9490-25]

Sensors for isolation of anti-cancer compounds found within marine invertebrates, Gordon W. Wiegand, Amanda C. LaRue, Medical Univ. of South Carolina (USA) . . . . [9490-26]

Space medical applications of optical 3D scanning, Jeremy Straub, Univ. of North Dakota (USA); Atif F. Mohammad, The Univ. of North Dakota (USA) . . . . [9490-27]

Early detection and monitoring of malaria, Mohammed Z. Rahman, LaGuardia Community College (USA); Leonid Roytman, The City College of New York (USA); Abdelhamid Kadik, Howard Miller, LaGuardia Community College (USA); Dilara A. Rosy, Univ. of Dhaka (Bangladesh) . . . . [9490-28]

SEE PROFESSIONAL DEVELOPMENT COURSES
pages 145–214

CONFERENCE 9491

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9491

Sensors for Extreme Harsh Environments II

Conference Chairs: **Debbie G. Senesky,** Stanford Univ. (USA); **Sachin Dekate,** GE Global Research (USA)

Program Committee: **Laurent A. Francis,** Univ. Catholique de Louvain (Belgium); **Jr-Hau (J.H.) He,** King Abdullah Univ. of Science and Technology (Saudi Arabia); **Kevin S. C. Kuang,** National Univ. of Singapore (Singapore)

WEDNESDAY 22 APRIL

SESSION 1. . . . . WED 3:30 PM TO 5:40 PM

Novel Harsh Environment Sensors for Energy Applications

Joint Session with Conferences 9467 and 9491

Session Chair: **Michael P. Buric,** National Energy Technology Lab. (USA)

Functional sensor material enabled harsh environment, high temperature optical sensors for energy applications *(Keynote Presentation)*, Paul R. Ohodnicki Jr., National Energy Technology Lab. (USA) . . . . [9467-53]

Ultra-high temperature fiber optical chemical sensors based on nano-porous metal oxides *(Invited Paper)*, Kevin P. Chen, Univ. of Pittsburgh (USA) . . . . [9467-54]

Phosphor-based fiber optic temperature sensors for harsh environments *(Invited Paper)*, Nicholas Djeu, Yutaka Shimoji, MicroMaterials, Inc. (USA) . . . . [9467-55]

Development of Laser induced breakdown spectroscopy (LIBS) sensor to assess groundwater quality impacts *(Invited Paper)*, Dustin McIntyre, Jinesh Jain, Cantwell Carson, Christian Goueguel, National Energy Technology Lab. (USA) . . . . [9467-56]

Temperature dependence of hydrogen related absorption in silica glass optical fibers at high temperatures *(Invited Paper)*, Elizabeth A. Bonnell, Li Yu, Daniel Homa, Virginia Tech Ctr. for Photonics Technology (USA) . . . . . [9467-57]

Analysis of the coupling optical fiber ultrasonic sensor for partial discharges detection, Fengmei F. Li, Yiying Liu, Linjie Wang, Chen Yu, Xi'an Jiaotong Univ. (China) . . . . [9491-15]

THURSDAY 23 APRIL

SESSION 2 . . . . .THU 8:00 AM TO 10:20 AM

Micro/Nano Sensing Technology for Harsh Environments

Session Chair: **Debbie G. Senesky,** Stanford Univ. (USA)

Harsh environment compatible chemical sensors: plasmonics and electrochemical device principles, Michael A. Carpenter, SUNY College of Nanoscale Science and Engineering (USA). . . . . [9491-1]

Growth and morphology of lead tin selenide for MWIR detectors, Christopher Cooper, Univ. of Maryland, Baltimore County (USA); Narasimha S. Prasad, NASA Langley Research Ctr. (USA); Bradley Arnold, Lisa Kelly, Fow-Sen Choa, Narsingh B. Singh, Univ. of Maryland, Baltimore County (USA) . . . . [9491-2]

Atomic layer deposited passivation films for AlGaN/GaN high electron mobility radiation dosimeters, Ateeq J. Suria, Stanford Univ. (USA); Chetan Angadi, Sharmila Bhattacharya, NASA Ames Research Ctr. (USA); Debbie G. Senesky, Stanford Univ. (USA) . . . . [9491-3]

Solar cells for harsh environments uses based on InGaN/GaN multiple quantum wells, Der-Hsien Lien, Yu-Hsuan Hsiao, Shih-Guo Yang, Si-Chen Lee, National Taiwan Univ. (Taiwan); Jr-Hau He, King Abdullah Univ. of Science and Technology (Saudi Arabia) . . . . [9491-4]

Irradiation effects of graphene-enhanced gallium nitride (GaN) metal-semiconductor-metal (MSM) ultraviolet photodetectors, Heather C. Chiamori, Nicholas Broad, Ruth Miller, Debbie G. Senesky, Stanford Univ. (USA) . . . . [9491-5]

Investigation of the optical and sensing characteristics of nanoparticle arrays for high temperature applications, Gnanaprakash Dharmalingam, Michael A. Carpenter, SUNY College of Nanoscale Science and Engineering (USA) . . . . [9491-6]

Wireless photonic power and data transfer to dormant devices, Harbans S. Dhadwal, Jahangir Rastegar, Dake Feng, Philip Kwok, Omnitek Partners, LLC (USA) . . . . [9491-7]

SESSION 3 . . . . THU 11:00 AM TO 12:00 PM

Optical Sensing Technology for Harsh Environments I

Session Chair: **Sachin Dekate,** GE Global Research (USA)

Characterization and calibration of Raman based distributed temperature sensing system for 600C operation, Sudeep Mandal, Boon Kwee Lee, Sachin Dekate, Renato Guida, GE Global Research (USA); Marc Goranson, Jerome Ybema, Suncor Energy Products, Ltd. (Canada) . . . . [9491-8]

Coherent probe-pump-based Brillouin sensor for harsh environments, L. F. Zou, OZ Optics Ltd. (Canada) . . . . [9491-9]

Potential of commercial single-mode optical fibers as distributed sensors for high temperature measurement with PPP-BOTDA, Yi Bao, Yizheng Chen, Fujian Tang, Weina Meng, Genda Chen, Missouri Univ. of Science and Technology (USA) . . . . [9491-10]

Lunch Break and Exhibition Time . . . . Thu 12:00 pm to 1:30 pm

SESSION 4 . . . . THU 1:30 PM TO 3:10 PM

Optical Sensing Technology for Harsh Environments II

Session Chair: **Sachin Dekate,** GE Global Research (USA)

Optical sensors for harsh environment applications, Rachit Sharma, GE Global Research (India); Anish Bekal, Arun K. Sridharan, Sameer Vartak, Chayan Mitra, GE India Technology Centre Pvt. Ltd. (India) . . . . [9491-11]

Analysis of the acoustic response in water and sand of different fiber optic sensing cables, Joachim Hofmann, Brugg Kabel AG (Switzerland) . . . [9491-12]

Optical fiber distributed temperature and distributed acoustic sensing for remote and harsh environments, Michael Mondanos, Tom Parker, Craig Milne, Jackson Yeo, Silixa Ltd. (United Kingdom); Mahmoud Farhadiroushan, Silixa, Ltd. (United Kingdom). . . . . [9491-13]

Planetary atmospheres minor species sensor balloon flight test to near space, Robert E. Peale, Christopher J. Fredricksen, Andrei V. Muraviev, Douglas Maukonen, Seth Calhoun, Joshua E. Colwell, Univ. of Central Florida (USA) . . . . [9491-14]

Optical fiber reliability in subsea monitoring, Kaustubh Nagarkar, Victor Ostroverkhov, Thomas Stecher, Mahadevan Balasubramaniam, Glen Koste, Sachin Dekate, Slawomir Rubinsztajn, GE Global Research (USA) . . . . [9491-16]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Thermal stability and energy harvesting characteristics of Au nanorods: harsh environment chemical sensing, Nicholas A. Karker, Gnanaprakash Dharmalingam, Nicholas Joy, Michael A. Carpenter, SUNY College of Nanoscale Science and Engineering (USA). . . . . [9491-17]

Microfabricated electrochemical sensors for combustion applications, Vitor A. Vulcano Rossi, SUNY College of Nanoscale Science and Engineering (USA); Max Mullen, The Ohio State Univ. (USA); Nicholas A. Karker, Zhouying Zhao, SUNY College of Nanoscale Science and Engineering (USA); Marek Kowarz, Smart System Technology & Commercialization Ctr. (USA); Prabir K. Dutta, The Ohio State Univ. (USA); Michael A. Carpenter, SUNY College of Nanoscale Science and Engineering (USA). . . . . [9491-18]

Data communication through multiple physical media: applications to munitions, Harbans S. Dhadwal, Jahangir Rastegar, Dake Feng, Philip Kwok, Omnitek Partners, LLC (USA) . . . . [9491-19]

Lessons learned and experience from land collapse accidents using remote sensing and GIS: case study of continuous land collapse in east Cairo area, Egypt, Mohamed N. Hegazy, National Authority for Remote Sensing and Space Sciences (Egypt) . . . . [9491-20]

CONFERENCE 9492

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9492

Advanced Photon Counting Techniques IX

Conference Chair: **Mark A. Itzler,** Princeton Lightwave, Inc. (USA)

Conference Co-Chair: **Joe C. Campbell,** Univ. of Virginia (USA)

Program Committee: **Gerald S. Buller,** Heriot-Watt Univ. (United Kingdom); **Sergio Cova,** Politecnico di Milano (Italy); **William H. Farr,** Jet Propulsion Lab. (USA); **Robert H. Hadfield,** Univ. of Glasgow (United Kingdom); **Majeed Hayat,** The Univ. of New Mexico (USA); **Michael A. Krainak,** NASA Goddard Space Flight Ctr. (USA); **Robert A. Lamb,** SELEX Galileo Ltd. (United Kingdom); **K. Alex McIntosh,** MIT Lincoln Lab. (USA); **Alan L. Migdall,** National Institute of Standards and Technology (USA); **Michael Wahl,** PicoQuant GmbH (Germany); **Hugo Zbinden,** Univ. of Geneva (Switzerland)

WEDNESDAY 22 APRIL

SESSION 1. . . . . WED 8:20 AM TO 10:00 AM

Single-Photon Applications I

Session Chair: **Joe C. Campbell,** Univ. of Virginia (USA)

Cutting the cord: toward wireless optical intensity interferometry *(Invited Paper)*, Elliott P. Horch, Southern Connecticut State Univ. (USA) . . . . . . [9492-1]

Time and spectrum-resolving multiphoton correlator for 300-900 nm, Piotr L. Kolenderski, Nicolaus Copernicus Univ. (Poland); Kelsey Johnsen, Institute for Quantum Computing (Canada); Thomas D. Jennewein, Univ. of Waterloo (Canada); Marilyne Thibault, Institute for Quantum Computing (Canada); Alberto Tosi, Carmelo Scarcella, Politecnico di Milano (Italy) . . . . [9492-2]

Photon counting camera for fluorescence lifetime imaging *(Invited Paper)*, Werner Zuschratter, Yury Prokazov, Evgeny Turbin, André Weber, Leibniz Institute für Neurobiologie Magdeburg (Germany); Roland Hartig, Otto-von-Guericke Univ. Magdeburg (Germany) . . . . [9492-3]

48-confocal-spots single-molecule measurements using a custom 48-pixel SPAD arrays with integrated timestamping, Antonino Ingargiola, Univ. of California, Los Angeles (USA); Luca Miari, Ivan Rech, Angelo Gulinatti, Massimo Ghioni, Politecnico di Milano (Italy); Shimon Weiss, Xavier Michalet, Univ. of California, Los Angeles (USA) . . . . [9492-4]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 2. . . . . WED 1:00 PM TO 1:45 PM

Keynote: SPDs and Quantum Sensing

Session Chair: **Mark A. Itzler,** Princeton Lightwave, Inc. (USA)

Single photon detectors and quantum sensing *(Keynote Presentation)*, John G. Rarity, Univ. of Bristol (United Kingdom) . . . . [9492-5]

SESSION 3 . . . . WED 1:45 PM TO 3:05 PM

Single-Photon Applications II

Session Chair: **Mark A. Itzler,** Princeton Lightwave, Inc. (USA)

Quantum key distribution on lit fibre *(Invited Paper)*, Zhiliang L. Yuan, Toshiba Research Europe Ltd. (United Kingdom). . . . . [9492-6]

Photon-counting communications receiver in the lunar lasercom ground terminal *(Invited Paper)*, Matthew E. Grein, Eric A. Dauler, Andrew J. Kerman, Mark L. Stevens, Richard J. Molnar, Bryan S. Robinson, Daniel V. Murphy, Don M. Boroson, MIT Lincoln Lab. (USA). . . . . [9492-7]

Single photon counting for space based quantum experiments, Rakhitha Chandrasekara, Zhongkan Tang, Yue Chuan Tan, Yong Sean Yau, Cliff Cheng, Ctr. for Quantum Technologies (Singapore); Christoph F. Wildfeuer, Kantonsschule Sursee (Switzerland); Alexander Ling, National Univ. of Singapore (Singapore). . . . . [9492-8]

SESSION 4 . . . . WED 3:35 PM TO 5:55 PM

Superconducting Single-Photon Detectors

Session Chair: **William H. Farr,** Jet Propulsion Lab. (USA)

Real-time, infrared single-photon imaging with a superconducting nanowire camera *(Invited Paper)*, Martin J. Stevens, Michael S. Allman, Varun B. Verma, Robert D. Horansky, National Institute of Standards and Technology (USA); Francesco Marsili, Matthew D. Shaw, Andrew D. Beyer, Jet Propulsion Lab. (USA); Richard P. Mirin, Sae Woo Nam, National Institute of Standards and Technology (USA). . . . . [9492-9]

Single photon imaging with superconducting nanowire single photon detectors *(Invited Paper)*, Robert H. Hadfield, Univ. of Glasgow (United Kingdom). . . . . [9492-10]

High performance superconducting nanowire single photon detectors embedded in silicon nanobeam cavities *(Invited Paper)*, Mohsen K. Akhlaghi, Ellen Schelew, Jeff F. Young, The Univ. of British Columbia (Canada) . [9492-11]

Waveguide-integrated WSi-based superconducting nanowire single-photon detectors *(Invited Paper)*, Ryan M. Briggs, Matthew D. Shaw, Francesco Marsili, Andrew D. Beyer, Jet Propulsion Lab. (USA); Justin D. Cohen, Sean Meenehan, Oskar J. Painter, California Institute of Technology (USA) . . . . [9492-12]

Large-area NbN superconducting nanowire avalanche photon detectors with saturated detection efficiency, Ryan P. Murphy, Matthew E. Grein, Theodore J. Gudmundsen, MIT Lincoln Lab. (USA); Adam McCaughan, Faraz Najafi, Massachusetts Institute of Technology (USA); Francesco Marsili, Jet Propulsion Lab. (USA); Eric A. Dauler, MIT Lincoln Lab. (USA) . . . . [9492-13]

THURSDAY 23 APRIL

SESSION 5 . . . . THU 8:10 AM TO 10:00 AM

Single-Photon LIDAR I

Session Chair: **Michael A. Krainak,**
NASA Goddard Space Flight Ctr. (USA)

Multi-channel single photon receiver for IceSat-2 Mission ATLAS instrument *(Invited Paper)*, Guangning Yang, Michael A. Krainak, Xiaoli Sun, NASA Goddard Space Flight Ctr. (USA); Wei Lu, As and D, Inc. (USA); William E. Hasselbrack, Sigma Space Corp. (USA) . . . . [9492-14]

Photon counting using maximal length sequences: a theoretical assessment of pseudo-random coding for rangefinding *(Invited Paper)*, Robert A. Lamb, SELEX ES (United Kingdom) . . . . [9492-15]

Time-of-flight laser ranging for moving targets with single-photon counting *(Invited Paper)*, Yan Liang, Univ. of Shanghai for Science and Technology (China); Heping Zeng, Univ. of Shanghai for Science and Technology (China) and East China Normal Univ. (China) . . . . [9492-16]

Underwater depth imaging using time-correlated single photon counting, Aurora Maccarone, Aongus McCarthy, Ximing Ren, Andrew M. Wallace, Heriot-Watt Univ. (United Kingdom); James Moffat, Defence Science and Technology Lab. (United Kingdom); Yvan R. Petillot, Gerald S. Buller, Heriot-Watt Univ. (United Kingdom). . . . . [9492-17]

SESSION 6 . . . . THU 10:30 AM TO 11:40 AM

Single-Photon LIDAR II

Session Chair: **Robert A. Lamb,** SELEX Galileo Ltd. (United Kingdom)

Real-time imaging and tracking of objects hidden from view using SPAD imaging arrays *(Invited Paper)*, Daniele Faccio, Genevieve Gariepy, Francesco Tonolini, Heriot-Watt Univ. (United Kingdom); Nikola Krstajic, Robert K. Henderson, The Univ. of Edinburgh (United Kingdom); Jonathan Leach, Heriot-Watt Univ. (United Kingdom) . . . . [9492-18]

Study of single photon counting for non line of sight vision, Martin Laurenzis, Institut Franco-Allemand de Recherches de Saint-Louis (France); Jonathan Klein, Univ. Bonn (Germany); Andreas Velten, Univ. of Wisconsin-Madison (USA) and Morgridge Institute for Research (USA); Matthias B. Hullin, Univ. Bonn (Germany); Frank Christnacher, Institut Franco-Allemand de Recherches de Saint-Louis (France) . . . . [9492-19]

Hybrid receiver system for single photon sensitive direct and coherent detection, Piotr K. Kondratko, Paul J. Suni, Andrew T. Bratcher, John J. Glennon III, Lockheed Martin Coherent Technologies (USA) . . . . [9492-20]

Lunch Break and Exhibition Time . . . . Thu 11:40 am to 12:50 pm

SESSION 7 . . . . THU 12:50 PM TO 3:20 PM

Geiger-Mode APDs

Session Chair: **K. Alex McIntosh,** MIT Lincoln Lab. (USA)

Silicon Geiger-mode avalanche photodiode arrays for photon-starved imaging *(Invited Paper)*, Brian F. Aull, MIT Lincoln Lab. (USA). . . . . [9492-21]

Gun muzzle flash detection using a single photon avalanche diode array in 0.18µm CMOS technology *(Invited Paper)*, Vitali Savuskan, Tomer Merhav, Avi Shoham, Igor Brouk, Yael Nemirovsky, Technion-Israel Institute of Technology (Israel) . . . . [9492-22]

Analysis and modeling of optical crosstalk in InP-based Geiger-mode avalanche photodiode FPAs, Quan Chau, Xudong Jiang, Mark A. Itzler, Mark Entwitsle, Mark Owens, Krystyna Slomkowski, Princeton Lightwave, Inc. (USA) . . . . [9492-23]

Model of turn-on characteristics of InP-based Geiger–mode avalanche photodiodes suitable for circuit simulations, George Jordy, Joseph P. Donnelly, MIT Lincoln Lab. (USA) . . . . [9492-24]

Low noise InGaAs/inp single-photon negative feedback avalanche diodes: characterization and applications *(Invited Paper)*, Gianluca Boso, Boris Korzh, Tommaso Lunghi, Hugo Zbinden, Univ. de Genève (Switzerland) . . . . . [9492-25]

Al0.8Ga0.2As avalanche photodiodes for single photon counting, Min Ren, Yaojia Chen, Wenlu Sun, Joe C. Campbell, Univ. of Virginia (USA); Xiao Jie Chen, Erik B. Johnson, James F. Christian, Radiation Monitoring Devices, Inc. (USA) . . . . [9492-26]

SESSION 8 . . . . THU 3:50 PM TO 5:40 PM

Novel Avalanche Diode SPDs

Session Chair: **Alan L. Migdall,**
National Institute of Standards and Technology (USA)

Nanopillar optical antenna avalanche detectors: 3D nanoscale electric fields for high speed, low noise avalanche gain *(Invited Paper)*, Pradeep N. Senanayake, Alan Farrell, Diana L. Huffaker, Univ. of California, Los Angeles (USA) . . . . [9492-27]

Visible to infrared photon counting with the MWIR HgCdTe e-APD *(Invited Paper)*, William W. Sullivan III, Jeffrey D. Beck, Richard Scritchfield, Mark R. Skokan, Pradip Mitra, DRS Technologies, Inc. (USA); Xiaoli Sun, James B. Abshire, NASA Goddard Space Flight Ctr. (USA); Darren P. Carpenter, Barry L. Lane, Analog/Digital Integrated Circuits, Inc. (USA) . . . . [9492-28]

Recent progress in upconversion detector and its application *(Invited Paper)*, Qiang Zhang, Univ. of Science and Technology of China (China) . . . . [9492-29]

Phase preservation and ultra-low background in parametric up-conversion at the single-photon level, Yu-Hsiang Cheng, Tim O. Thomay, Joint Quantum Institute (USA) and National Institute of Standards and Technology (USA); Alan L. Migdall, Glenn S. Solomon, Joint Quantum Institute (USA) and National Institute of Standards and Technology (USA); Sergey V. Polyakov, Joint Quantum Institute (USA) and National Institute of Standards and Technology (USA) . . . . [9492-30]

CONFERENCE 9493

Tuesday 21 April 2015 • Proceedings of SPIE Vol. 9493

Energy Harvesting and Storage: Materials, Devices, and Applications VI

Conference Chairs: **Nibir K. Dhar,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Achyut K. Dutta,** Banpil Photonics, Inc. (USA)

Program Committee: **Pulickel M. Ajayan,** Rice Univ. (USA); **Paul Boieriu,** EPISOLAR, Inc. (USA); **Deryn Chu,** U.S. Army Research Lab. (USA); **M. Saif Islam,** Univ. of California, Davis (USA); **Nobuhiko P. Kobayashi,** Univ. of California, Santa Cruz (USA); **Pooi See Lee,** Nanyang Technological Univ. (Singapore); **Pat McGrath,** Booz Allen Hamilton Inc. (USA); **Robert Olah,** Banpil Photonics, Inc. (USA); **Kimberly A. Sablon,** U.S. Army Research Lab. (USA); **A. Fred Semendy,** U.S. Army Research Lab. (USA); **Sivalingam Sivananthan,** EPIR Technologies (USA); **Ashok K. Sood,** Magnolia Optical Technologies, Inc. (USA); **Patrick J. Taylor,** U.S. Army Research Lab. (USA); **Sudhir B. Trivedi,** Brimrose Corp. of America (USA); **Rama Venkatasubramanian,** RTI International (USA); **Chunlei Wang,** Florida International Univ. (USA); **Priyalal Wijewarnasuriya,** U.S. Army Research Lab. (USA)

TUESDAY 21 APRIL

OPENING REMARKS. . . . . 8:30 AM TO 8:35 AM

Conference Chair: **Nibir K. Dhar,**
U.S. Army Night Vision & Electronic Sensors Directorate (USA)

SESSION 1. . . . . TUE 8:35 AM TO 10:00 AM

Advanced Fuel Cells

Session Chairs: **Nibir K. Dhar,**
U.S. Army Night Vision & Electronic Sensors Directorate (USA);
Achyut K. Dutta, Banpil Photonics, Inc. (USA)

Micro enzymatic biofuel cells: from theoretical to experimental aspect *(Invited Paper)*, Chunlei Wang, Yin Song, Chunhui Chen, Richa Agrawal, Yong Hao, Florida International Univ. (USA) . . . . [9493-1]

Performance study of sugar-yeast-ethanol bio-hybrid fuel cells, Justin P. Jahnke, David M. Mackie, Marcus Benyamin, Sanchao Liu, James J. Sumner, U.S. Army Research Lab. (USA); Rahul Ganguli, Teledyne Scientific Co. (USA) . . . . [9493-2]

Synergic system between photovoltaic module and microbial fuel cell with simultaneous pollution control, Oresta M. Vasyliv, Arterium Corp. (Ukraine); Neelkanth G. Dhere, Univ. of Central Florida (USA) . . . . [9493-3]

Inhomogeneous thermoelectrics: improving overall ZT by localized property variations, Narasimha S. Prasad, NASA Langley Research Ctr. (USA); David C. Nemir, Jan Beck, TXL Group, Inc. (USA); Jay R. Maddux, Patrick J. Taylor, U.S. Army Research Lab. (USA) . . . . [9493-4]

Solar fuel production for a sustainable energy *(Invited Paper)*, Deryn D. Chu, U.S. Army Research Lab. (USA); Nick Wu, West Virginia Univ. (USA); Terry DuBois, Edward J. Plichta, U.S. Army RDECOM CERDEC NVESD (USA) [9493-5]

SESSION 2 . . . . TUE 10:30 AM TO 11:50 AM

Advanced Storage and Battery Technologies

Session Chairs: **Chunlei Wang,** Florida International Univ. (USA);
Achyut K. Dutta, Banpil Photonics, Inc. (USA)

Dielectric properties of low temperature nano engineered Y2/3Cu3Ti4O12 ceramic compound, K. D. Mandal, Sunita Sharma, Shiv S. Yadav, Institute of Technology, Banaras Hindu Univ. (India); M. M. Singh, Narsingh B. Singh, Univ. of Maryland, Baltimore County (USA) . . . . [9493-6]

Effect of organic flux on the colossal dielectric constant of CCTO, Vishnu Razdan, Carnegie-Mellon Univ. (USA); Abhishek Singh, The Pennsylvania State Univ. (USA); Brad Arnold, Fow-Sen Choa, Lisa Kelly, Narsingh B. Singh, Univ. of Maryland, Baltimore County (USA) . . . . [9493-7]

Mapping capacity loss in Al anodes for ultra-lightweight and compact all-solid-state batteries, Chen Gong, Alex Pearse, Univ. of Maryland, College Park (USA); Dmitry Ruzmetov, National Institute of Standards and Technology (USA) and Univ. of Maryland, College Park (USA); Gary Rubloff, Univ. of Maryland, College Park (USA); Norman C. Bartelt, A. Alec Talin, Sandia National Labs. (USA); Marina S. Leite, Univ. of Maryland, College Park (USA) . . . . [9493-8]

Effect of temperature and thickness of the graphene on the hydrogen storage properties, Jie Huang, Chee How Wong, Nanyang Technological Univ. (Singapore) . . . . [9493-9]

Hybridization of lithium-ion batteries and electrochemical capacitors: fabrication and challenges *(Invited Paper)*, Chunlei Wang, Richa Agrawal, Chunhui Chen, Yin Song, Yong Hao, Florida International Univ. (USA) . [9493-10]

Lunch Break and Exhibition Time . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . TUE 1:20 PM TO 3:10 PM

Advanced Harvesting Device and Applications

Session Chairs: **Achyut K. Dutta,** Banpil Photonics, Inc. (USA);
Chunlei Wang, Florida International Univ. (USA)

Carbon microelectromechanical systems (C-MEMS) based microsupercapacitors, Chunlei Wang, Chunhui Chen, Yin Song, Richa Agrawal, Yong Hao, Florida International Univ. (USA) . . . . [9493-11]

Paper-based broadband and wide-angle antireflection coatings for Si and GaAs solar cells, Dongheon Ha, Jeremy N. Munday, Univ. of Maryland, College Park (USA) . . . . [9493-12]

High efficiency solar cells utilizing light-trapping structure, Anil Shrestha, Genki Mizuno, Robert Olah, Banpil Photonics, Inc. (USA); Saif Islam, Banpil Photonics Inc (USA); Achyut K Dutta, Banpil Photonics, Inc. (USA); Nibir K Dhar, Night Vision Lab (USA) . . . . [9493-13]

Pulsed microwave heating method for preparation of dye-sensitized solar cells for greener, faster, cheaper production of photovoltaic materials, Clifford B. Murphy, Roger Williams Univ. (USA); Robert Cotta, The Univ. of Texas at El Paso (USA); Timothy Blais, Roger Williams Univ. (USA); Charles B. Hall, QD Vision, Inc. (USA). . . . . [9493-14]

Piezoelectric energy-harvesting power source and event detection sensors for gun-fired munitions, Jahangir Rastegar, Dake Feng, Omnitek Partners, LLC (USA); Carlos M. Pereira, U.S. Army Armament Research, Development and Engineering Ctr. (USA). . . . . [9493-16]

C-MEMS for bio-sensing applications *(Invited Paper)*, Chunlei Wang, Yin Song, Chunhui Chen, Yong Hao, Richa Agrawal, Florida International Univ. (USA) . . . . [9493-17]

Energy harvesting via ferrofluidic induction, John G. Monroe, Erick S. Vasquez, Zachary S. Aspin, Keisha B. Walters, Matthew J. Berg, Scott M. Thompson, Mississippi State Univ. (USA) . . . . [9493-15]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Interconnection between tricarboxylic acid cycle and energy generation in microbial fuel cell performed by desulfuromonas acetoxidans IMV B-7384, Oresta M. Vasyliv, Arterium Corp. (Ukraine); Olga D. Maslovska, Yaroslav P. Ferensovych, Oleksandr I. Bilyy, Svitlana O. Hnatush, Ivan Franko National Univ. of L'viv (Ukraine) . . . . [9493-18]

Alloyed metal nanoparticles with modulated optical properties for photovoltaics, Allen Chang, Chen Gong, Ellen Cesewski, Marina S. Leite, Univ. of Maryland, College Park (USA). . . . . [9493-19]

A new scattering and absorption enhancement mechanism using quantum dot emission, Yunlu Xu, Jeremy N. Munday, Univ. of Maryland, College Park (USA) . . . . [9493-20]

Power conversion and photodetection through hot carrier generation and collection in a TCO-insulator-metal based device, Tao Gong, Jeremy N. Munday, Univ. of Maryland, College Park (USA). . . . . [9493-21]

The electrical and structural analysis of degraded single junction amorphous silicon solar modules, Gilbert O. Osayemwenre, Univ. of Fort Hare (South Africa). . . . . [9493-22]

Spray-on solar cells using non-toxic nanocrystal inks, Troy K. Townsend, Harry K. Kelderman, St. Mary's College of Maryland (USA) . . . . [9493-23]

How effective are Lambertian dielectric scatterers for light trapping?, Joseph Murray, Jeremy N. Munday, Univ. of Maryland, College Park (USA) . . . . [9493-24]

Enhanced vibration energy harvesting using nonlinear oscillations, Emily K. Engel, Jiaying Wei, Christopher Lee, Franklin W. Olin College of Engineering (USA) . . . . [9493-25]

CONFERENCE 9494A

Wednesday 22 April 2015 • Part of Proceedings of SPIE Vol. 9494

Sensors for Next-Generation Robotics II

Conference Chairs: **Dan Popa,** The Univ. of Texas at Arlington (USA); **Muthu B. J. Wijesundara,** The Univ. of Texas at Arlington Research Institute (USA)

Program Committee: **Ashis G. Banerjee,** GE Global Research (USA); **Ryan R. Close,** U.S. Army RDECOM CERDEC NVESD (USA); **Yong-Lae Park,** Carnegie Mellon Univ. (USA); **Micky Rakotondrabe,** FEMTO-ST (France); **Veronica J. Santos,** Univ. of California, Los Angeles (USA)

WEDNESDAY 22 APRIL

WELCOME REMARKS . . . . 8:00 AM TO 8:10 AM

Conference Chair: **Dan Popa,** The Univ. of Texas at Arlington (USA)

SESSION 1. . . . . WED 8:10 AM TO 10:00 AM

New Sensors for Robots

Session Chair: **Muthu B. J. Wijesundara,** The Univ. of Texas at Arlington Research Institute (USA)

Silicon carbide micro-/nanosystems for sensing and energy applications in harsh environment *(Invited Paper)*, Carlo Carraro, Roya Maboudian, Univ. of California, Berkeley (USA) . . . . [9494-1]

EHD printing of PEDOT: PSS inks for fabricating pressure sensor arrays on flexible substrates, Joshua R. Baptist, Woo Ho Lee, Dan O. Popa, Muthu B. J. Wijesundara, The Univ. of Texas at Arlington (USA) . . . . [9494-2]

Multi-material additive manufacturing of robot components with integrated sensor arrays, Adam Cohen, Matt Saari, Bryan Cox, Matt Galla, Paul Krueger, Edmond Richer, Southern Methodist Univ. (USA). . . . . [9494-3]

Micro-force sensing mobile microrobots for mechanobiology, Wuming Jing, Peter Jaron, Archit Aggarwal, David J. Cappelleri, Purdue Univ. (USA) . . [9494-4]

Magnetoresistive sensors for the next robot generation, Rolf Slatter, Sensitec GmbH (Germany) . . . . [9494-5]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 2 . . . . WED 1:00 PM TO 3:00 PM

Robotic Applications

Session Chair: **Ryan R. Close,** U.S. Army RDECOM CERDEC NVESD (USA)

Perception sensor study for high speed autonomous operations, Anne R. Schneider, Zachary La Celle, Alberto Lacaze, Karl Murphy, Robotic Research LLC (USA); Mark Del Giorno, Del Services, LLC (USA); Ryan R. Close, U.S. Army RDECOM CERDEC NVESD (USA) . . . . [9494-6]

Multi-model sensor and HMI integration with applications in personal robotics, Rommel A. Alonzo, Sven Cremer, Dan O. Popa, The Univ. of Texas at Arlington (USA) . . . . [9494-7]

Robotic situational awareness of actions in human teaming, David Tahmoush, U.S. Army Research Lab. (USA). . . . . [9494-8]

Performance evaluation and clinical applications of 3D plenoptic cameras, Ryan Decker, Azad Shademan, Justin Opfermann, Simon Leonard, Peter C. W. Kim, Axel Krieger, Children's National Medical Ctr. (USA) . . . . [9494-9]

Surface EMG and intra-socket force measurement to control a prosthetic device, Joe D. Sanford, Oguz Yetkin, The Univ. of Texas at Arlington (USA); Carolyn Young, Nicoleta Bugnariu, Rita M. Patterson, Univ. of North Texas Health Science Ctr. at Fort Worth (USA); Dan O. Popa, The Univ. of Texas at Arlington (USA) . . . . [9494-10]

Resolving ranges of layered objects using ground vehicle LiDAR, Jim Hollinger, Brett Kutscher, LSA Autonomy LLC (USA); Ryan R. Close, U.S. Army RDECOM CERDEC NVESD (USA). . . . . [9494-11]

SESSION 3 . . . . WED 3:30 PM TO 4:50 PM

Control

Session Chair: **Ashis Gopal Banerjee,** GE Global Research (USA)

Automated actuation of multiple bubble microrobots using computer-generated holograms, M. Arifur Rahman, Julian Cheng, Qihui Fan, Aaron T. Ohta, Univ. of Hawaii at Manoa (USA) . . . . [9494-12]

An ontology to enable optimized task partitioning in human-robot collaboration for warehouse kitting operations, Ashis G. Banerjee, Andrew Barnes, GE Global Research (USA); Krishnanand N. Kaipa, Jiashun Liu, Shaurya Shriyam, Nadir Shah, Satyandra K. Gupta, Univ. of Maryland, College Park (USA) . . . . [9494-13]

Control of a powered prosthetic device via a pinch gesture interface, Oguz Yetkin, Joe D. Sanford, Dan O. Popa, The Univ. of Texas at Arlington (USA) . . . . [9494-14]

Interaction models between robots wearing sensorized skin and their environment, Md Ahsan Habib, Ioana Corina Bogdan, Dan O. Popa, The Univ. of Texas at Arlington (USA) . . . . [9494-15]

CONFERENCE 9494B

Tuesday 21 April 2015 • Part of Proceedings of SPIE Vol. 9494

Machine Intelligence and Bio-inspired Computation: Theory and Applications IX

Conference Chair: **Misty Blowers,** Air Force Research Lab. (USA)

Program Committee: **Gus Anderson,** MacAulay-Brown, Inc. (USA); **Georgiy M. Levchuk,** Aptima, Inc. (USA); **John A. Marsh,** State Univ. of New York Institute of Technology (USA); **Clare D. Thiem,** Air Force Research Lab. (USA); **Robinson Pino,** U.S. Dept. of Energy (USA); **Daniel Stambovsky,** Air Force Research Lab. (USA); **Jonathan Williams,** Air Force Research Lab. (USA); **Bryant T. Wysocki,** Air Force Research Lab. (USA)

TUESDAY 21 APRIL

SESSION 1. . . . . TUE 1:00 PM TO 2:20 PM

Advances in Fundamental Research

Session Chair: **Misty Blowers,** Air Force Research Lab. (USA)

Evolving spiking neural networks: a novel growth algorithm, J. David Schaffer, Binghamton Univ. (USA) . . . . [9494-16]

Tractability and experimental analysis of a Lotka-Volterra neural network for classification, Christopher L. Sukhu, Joseph E. Stanton, Marc Aylesworth, BAE Systems (USA). . . . . [9494-17]

Collaborative mining and transfer learning for relational data, Georgiy M. Levchuk, Andres Ortiz, Aptima, Inc. (USA) . . . . [9494-18]

Spike encoding for dynamical control system architecture, Bryant T. Wysocki, Thomas A. McEwen, Clare D. Thiem, Nathan R. McDonald, Air Force Research Lab. (USA) . . . . [9494-19]

SESSION 2 . . . . TUE 2:20 PM TO 3:20 PM

Innovations in Applied Research

Session Chair: **Daniel Stambovsky,** Air Force Research Lab. (USA)

Experimental study of a fuzzy-logic-based control approach for maintaining wireless communication connections among multiple mobile robots, Xu Zhong, Stony Brook Univ. (USA); Yu Zhou, State Univ. of New York Institute of Technology (USA) . . . . [9494-20]

Bio-inspired approach for intelligent unattended ground sensors, Nicolas Hueber, Pierre Raymond, Christophe Hennequin, Maxime Perrot, Philippe Voisin, Alexander Pichler, Julien Pichard, Jean-Pierre Moeglin, Institut Franco-Allemand de Recherches de Saint-Louis (France) . . . . [9494-21]

Evaluating data distribution and drift vulnerabilities of machine learning algorithms in secure and adversarial environments part two, Kevin M. Nelson, George E. Corbin, Mark Anania, Matthew G. Kovacs, BAE Systems (USA); Misty Blowers, Air Force Research Lab. (USA) . . . . [9494-22]

SESSION 3 . . . . TUE 3:50 PM TO 4:50 PM

Improved Situational Awareness

Session Chair: **Bryant T. Wysocki,** Air Force Research Lab. (USA)

Subset selection of training data for machine learning: a situational awareness system case study, Sebastien Wong, Mark C. McKenzie, Defence Science and Technology Organisation (Australia). . . . . [9494-23]

Realistic computer network simulation for network intrusion detection dataset generation, Garrett S. Payer, ICF International (USA) . . . . [9494-24]

Change detection in satellite imagery using clustering of sparse approximations (CoSA) over learned feature dictionaries, Daniela I. Moody, Los Alamos National Lab. (USA) . . . . [9494-25]

CONFERENCE 9495

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9495

Three-Dimensional Imaging, Visualization, and Display 2015

Conference Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Conference Co-Chairs: **Osamu Matoba,** Kobe Univ. (Japan); **Manuel Martínez-Corral,** Univ. de València (Spain); **Adrian Stern,** Ben-Gurion Univ. of the Negev (Israel)

Program Committee: **Arun Anand,** Maharaja Sayajirao Univ. of Baroda (India); **Jun Arai,** NHK Japan Broadcasting Corp. (Japan); **V. Michael Bove Jr.,** MIT Media Lab. (USA); **Michael T. Eismann,** Air Force Research Lab. (USA); **Pietro Ferraro,** Istituto Nazionale di Ottica (Italy); **Toshiaki Fujii,** Nagoya Univ. (Japan); **Hong Hua,** College of Optical Sciences, The Univ. of Arizona (USA); **Yi-Pai Huang,** National Chiao Tung Univ. (Taiwan); **Naomi Inoue,** National Institute of Information and Communications Technology (Japan); **Dae-Sik Kim,** SAMSUNG Electronics Co., Ltd. (Korea, Republic of); **Jinwoong Kim,** Electronics and Telecommunications Research Institute (Korea, Republic of); **Thomas J. Naughton,** National Univ. of Ireland, Maynooth (Ireland); **Wolfgang Osten,** Univ. Stuttgart (Germany); **Min-Chul Park,** Korea Institute of Science and Technology (Korea, Republic of); **David J. Rabb,** Air Force Research Lab. (USA); **José Manuel Rodríguez Ramos,** Univ. de La Laguna (Spain); **Sumio Yano,** Shimane Univ. (Japan); **Zeev Zalevsky,** Bar-Ilan Univ. (Israel)

MONDAY 20 APRIL

SESSION 1. . . . . MON 8:10 AM TO 10:00 AM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Portable digital holographic microscope using spherical reference beam and its biomedical applications *(Invited Paper)*, Eriko Watanabe, Kanami Ikeda, Kazuhiro Hoshino, The Univ. of Electro-Communications (Japan) [9495-1]

Three-dimensional microscopy through liquid-lens axial scanning *(Invited Paper)*, Manuel Martínez-Corral, Univ. de València (Spain); Po-Yuan Hsieh, National Chiao Tung Univ. (Taiwan); Ana Isabel Doblas-Exposito, Emilio Sánchez-Ortiga, Genaro Saavedra, Univ. de València (Spain); Yi-Pai Huang, National Chiao Tung Univ. (Taiwan) . . . . [9495-2]

An integral imaging augmented reality display *(Invited Paper)*, Hong Hua, College of Optical Sciences, The Univ. of Arizona (USA); Bahram Javidi, Univ. of Connecticut (USA). . . . . [9495-3]

Integrated fluorescence and phase-contrast digital holographic microscopy for live cell imaging, Xiangyu Quan, Kouichi Nitta, Osamu Matoba, Kobe Univ. (Japan); Peng Xia, Yasuhiro Awatsuji, Kyoto Institute of Technology (Japan) . . . . [9495-4]

SESSION 2 . . . . MON 10:20 AM TO 11:50 AM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Floating information display based on aerial imaging by retro-reflection (AIRR) *(Invited Paper)*, Hirotsugu Yamamoto, Utsunomiya Univ. (Japan) [9495-5]

Recent developments in DFD (depth-fused 3D) display and arc 3D display *(Invited Paper)*, Shiro Suyama, Univ. of Tokushima (Japan); Hirotsugu Yamamoto, Utsunomiya Univ. (Japan) . . . . [9495-6]

Floating three-dimensional image display using micro-mirror array imaging element *(Invited Paper)*, Daisuke Miyazaki, Yuki Maeda, Osaka City Univ. (Japan); Satoshi Maekawa, Parity Innovations Co. Ltd. (Japan). . . . . [9495-7]

Lunch Break . . . . Mon 11:50 am to 12:50 pm

SESSION 3 . . . . MON 12:50 PM TO 2:30 PM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Evaluation of viewing experiences induced by curved 3D display *(Invited Paper)*, Sungchul Mun, Min-Chul Park, Korea Institute of Science and Technology (Korea, Republic of); Sumio Yano, Shimane Univ. (Japan) . . [9495-8]

Accommodation response for integral photography still images, Sumio Yano, Shimane Univ. (Japan); Min-Chul Park, Korea Institute of Science and Technology (Korea, Republic of) . . . . [9495-9]

Effect of brightness in visual discomfort caused from watching 3D and 2D video, Yongwoo Kim, Hang-Bong Kang, The Catholic Univ. of Korea (Korea, Republic of) . . . . [9495-10]

The performances of a supermultiview simulator and the presence of monocular depth sense *(Invited Paper)*, Beom-Ryeol Lee, Jeung-Chul Park, Ilkwon Jeong, Electronics and Telecommunications Research Institute (Korea, Republic of); Jung-Young Son, Konyang Univ. (Korea, Republic of) . . . [9495-11]

SESSION 4 . . . . MON 2:30 PM TO 4:40 PM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Integral imaging for anti-access/area denial environments *(Invited Paper)*, Shih-Chi K. Chen, Abhijit Mahalanobis, Robert Stanfill, Lockheed Martin Missiles and Fire Control (USA); Bahram Javidi, Univ. of Connecticut (USA). . . . [9495-12]

Full-parallax 3D display from single-shot Kinect capture, Seok-Min Hong, Dong-Hak Shin, Byung-Gook Lee, Dongseo Univ. (Korea, Republic of); Adrián Dorado, Genaro Saavedra, Manuel Martínez-Corral, Univ. de València (Spain) . . . . [9495-13]

2D MEMS scanning for lidar with sub-Nyquist sampling, electronics and measurement procedure, Thorsten Giese, Joachim Janes, Fraunhofer-Institut für Siliziumtechnologie (Germany). . . . . [9495-14]

Shaping field for 3D deep tissue microscopy, Hyungsik Lim, Jorge Colon, Hunter College (USA) . . . . [9495-15]

Spatial-spectral volume holographic microscopy, Yuan Luo, National Taiwan Univ. (Taiwan) . . . . [9495-16]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 5 . . . . TUE 8:30 AM TO 10:30 AM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Compact integral three-dimensional imaging device *(Invited Paper)*, Jun Arai, NHK Japan Broadcasting Corp. (Japan); Takayuki Yamashita, Hitoshi Hiura, Masato Masato, Ryohei Funatsu, NHK (Japan Broadcasting Corporation) (Japan); Eisuke Nakasu, NHK Engineering System, Inc. (Japan) . . . . . . [9495-17]

Using perceivable light fields to evaluate the amount of information that autostereoscopic displays need to cast *(Invited Paper)*, Adrian Stern, Ben-Gurion Univ. of the Negev (Israel); Bahram Javidi, Univ. of Connecticut (USA) . . . . [9495-18]

Integral imaging acquisition and processing for human gesture recognition *(Invited Paper)*, Pedro Latorre Carmona, Eva Salvador-Balaguer, Filiberto Pla, Univ. Jaume I (Spain); Bahram Javidi, Univ. of Connecticut (USA). . . . . [9495-19]

Optical barriers in integral imaging monitors through micro-Köhler illumination *(Invited Paper)*, Manuel Martínez-Corral, Héctor Navarro, Genaro Saavedra, Amparo Pons-Martí, Univ. de València (Spain); Raul Martinez-Cuenca, Univ. Jaume I (Spain); Angel Tolosa, AIDO Instituto Tecnológico de Óptica, Color e Imagen (Spain); Bahram Javidi, Univ. of Connecticut (USA) . . . . [9495-20]

SESSION 6 . . . . .TUE 10:30 AM TO 11:50 AM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Digital holographic measurement for voice recording and reproduction *(Invited Paper)*, Osamu Matoba, Hiroki Inokuchi, Kobe Univ. (Japan); Yasuhiro Awatsuji, Kyoto Institute of Technology (Japan) . . . . [9495-21]

High-speed parallel phase-shifting digital holography system using special-purpose computer for image reconstruction *(Invited Paper)*, Takashi Kakue, Tomoyoshi Shimobaba, Tomoyoshi Ito, Chiba Univ. (Japan) . . . . [9495-22]

Implementation of wireless 3D stereo image capture system and 3D exaggeration algorithm for the region of interest, Woonchul C. Ham, Chonbuk National Univ. (Korea, Republic of) . . . . [9495-23]

Lunch Break . . . . Tue 11:50 am to 1:20 pm

SESSION 7 . . . . .TUE 1:20 PM TO 4:30 PM

Session Chairs: **Bahram Javidi,** Univ. of Connecticut (USA); **Jung-Young Son,** Konyang Univ. (Korea, Republic of)

Crosstalks in multiview 3D images *(Invited Paper)*, Jung-Young Son, Konyang Univ. (Korea, Republic of); Beom-Ryeol Lee, Electronics and Telecommunications Research Institute (Korea, Republic of); Min-Chul Park, Thibault Leportier, Korea Institute of Science and Technology (Korea, Republic of) . . . . [9495-24]

Ligthfield superresolution through turbulence *(Invited Paper)*, Juan M. T. Trujillo-Sevilla, Univ. de La Laguna (Spain); Luis Fernando Rodriguez-Ramos, Instituto de Astrofísica de Canarias (Spain); José Manuel Rodríguez Ramos, Univ. de La Laguna (Spain) and ITB-CIBICAN (Spain) . . . . [9495-25]

Spectral analysis of views interpolated by Chroma subpixel downsampling, Avishai Marson, Adrian Stern, Ben-Gurion Univ. of the Negev (Israel) . . [9495-26]

2D MEMS scanning for lidar with sub-Nyquist sampling, set-up and functionality, Joachim Janes, Thorsten Giese, Fraunhofer-Institut für Siliziumtechnologie (Germany) . . . . [9495-27]

FTV standardization for super multiview and free navigation in MPEG *(Invited Paper)*, Masayuki Tanimoto, Nagoya Industrial Science Research Institute (Japan) . . . . [9495-28]

Research on steady-state visual evoked potentials in 3D displays *(Invited Paper)*, Yu-Yi Chien, Chia-Ying Lee, Fang-Cheng Lin, Yi-Pai Huang, Han-Ping D. Shieh, National Chiao Tung Univ. (Taiwan). . . . . [9495-29]

Reconstruct holographic 3D objects by double phase hologram *(Invited Paper)*, Chih-Hung Ting, National Chiao Tung Univ. (Taiwan); Koki Wakunami, Kenji Yamamoto, National Institute of Information and Communications Technology (Japan); Yi-Pai Huang, National Chiao Tung Univ. (Taiwan) [9495-30]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Format matching using multiple-planes pseudoscopic-to-orthoscopic conversion for 3D integral imaging display, Xin Shen, Xiao Xiao, Univ. of Connecticut (USA); Manuel Martínez-Corral, Univ. de València (Spain); Bahram Javidi, Univ. of Connecticut (USA). . . . . [9495-31]

A comparison of a DEM's derived from DS2, LIDAR and Kompsat-3, Eman S. Altunaiji, Emirates Institution for Advanced Science and Technology (United Arab Emirates) . . . . [9495-32]

Color image authentication scheme via multispectral photon-counting double random phase encoding, Inkyu Moon, Chosun Univ. (Korea, Republic of) . . . . [9495-33]

Parallel reconstruction of multiple depth slice images with focused parts in integral imaging via graphics processing unit, Inkyu Moon, Faliu Yi, Chosun Univ. (Korea, Republic of) . . . . [9495-34]

Optimizing the diffraction efficiency of LCOS-based holography with anomalous reflection by gradient meta-surface, Chuan Shen, Kaifeng Liu, Sui Wei, Lei Ni, Hao Wang, Anhui Univ. (China) . . . . [9495-35]

Phase retrieval using iterative Fourier transform and convex optimization algorithm, Zhang Fen, Cheng Hong, Quanbing Zhang, Sui Wei, Anhui Univ. (China) . . . . [9495-36]

A novel hybrid phase retrieval algorithm for partially coherent light illuminations, Hong Cheng, Fen Zhang, Sui Wei, Yanliu Liu, Yapin Chen, Anhui Univ. (China) . . . . [9495-37]

3D high speed characterization of phase and amplitude objects using the transport of intensity equation, Georges T. Nehmetallah, Thanh Nguyen, The Catholic Univ. of America (USA); Ahmad Darudi, Peyman Soltani, Univ. of Zanjan (Iran, Islamic Republic of) . . . . [9495-38]

3D subsurface imaging of crustal rocks using components of electromagnetic radiations based on Maxwell theory prior seismic events in situ, Umesh P. Verma, Ranvir N. Nandan, Patna Science College (India). . . . . [9495-39]

Color reconstruction of computer-generated hologram for real scenes using a light field camera, Yutaka Endo, Takashi Kakue, Tomoyoshi Shimobaba, Tomoyoshi Ito, Chiba Univ. (Japan) . . . . [9495-40]

Compressive holography reconstruction using parallel phase-shifting interferometry, Cheng Zhang, Chuan Shen, Hong Cheng, Fen Zhang, Kaifeng Liu, Quanbing Zhang, Sui Wei, Anhui Univ. (China). . . . . [9495-41]

Viewing zone control of super multi-view display with directional backlight, Kenji Hirano, Nagaoka Univ. of Technology (Japan). . . . . [9495-42]

The use of 3D scanning for sporting applications, Kevin J. Friel, Pann Ajjimaporn, Jeremy Straub, Scott Kerlin, Univ. of North Dakota (USA) . [9495-43]

The use of 3D scanning for wellness assessment purposes, Pann Ajjimaporn, Kevin J. Friel, Jeremy Straub, Scott Kerlin, Univ. of North Dakota (USA) . . . . [9495-44]

Gesture recognition and space-division multiplexing enabled fog based interactive 360-degree viewable display, Praneeth K. Chakravarthula, Indian Institute of Technology Madras (India); Pattie Maes, Massachusetts Institute of Technology (USA) . . . . [9495-45]

Projection type transparent 3D display using active screen, Hiroki Kamoshita, Nagaoka Univ. of Technology (Japan) . . . . [9495-46]

Noise reduction in holographic reconstruction by combining two spatial light modulators, Thibault Leportier, Min-Chul Park, Korea Institute of Science and Technology (Korea, Republic of); Jung-Young Son, Konyang Univ. (Korea, Republic of) . . . . [9495-47]

Evaluating visual discomfort in stereoscopic projection-based CAVE system with a close viewing distance, Weitao Song, Beijing Institute of Technology (China) and Univ. of Connecticut (USA); Dongdong Weng, Dan Feng, Yue Liu, Yongtian Wang, Beijing Institute of Technology (China) . [9495-48]

Conditions in order to maintain the viewing zone in autostereoscopic display, Seon Kyu Yoon, Korea Institute of Science and Technology (Korea, Republic of) and Korea Univ. (Korea, Republic of); Sung Kyu Kim, Korea Institute of Science and Technology (Korea, Republic of) . . . . [9495-49]

Impact of lighting and attire on 3D scanner performance, Dakota J. Feist, Jeremy Straub, Scott Kerlin, Univ. of North Dakota (USA) . . . . [9495-50]

Integrating visible light 3D scanning into the everyday world, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9495-51]

CONFERENCE 9496

Wednesday 22 April 2015 • Proceedings of SPIE Vol. 9496

Independent Component Analyses, Compressive Sampling, Large Data Analyses (LDA), Neural Networks, Biosystems, and Nanoengineering XIII

Conference Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Conference Co-Chairs: **Liyi Dai,** U.S. Army Research Office (USA); **Yufeng Zheng,** Alcorn State Univ. (USA)

Program Committee: **Shun-ichi Amari,** RIKEN (Japan); **Richard G. Baraniuk,** Rice Univ. (USA); **John J. Benedetto,** Univ. of Maryland, College Park (USA); **Henry Chu,** Univ. of Louisiana at Lafayette (USA); **Ronald R. Coifman,** Yale Univ. (USA); **John Daugman,** Univ. of Cambridge (United Kingdom); **David Donohoe,** Stanford Univ. (USA); **Ronald G. Driggers,** St. Johns Optical Systems (USA); **Jide Familoni,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Fredric M. Ham,** Florida Institute of Technology (USA); **Yutaka Hata,** Univ. of Hyogo (Japan); **Charles C. Hsu,** Trident Systems Inc. (USA); **Tzyy-Ping Jung,** Univ. of California, San Diego (USA); **Marc W. Kirschner,** Harvard Medical School (USA); **Keith A. Krapels,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Horacio Lamela,** Univ. Carlos III de Madrid (Spain); **Joseph S. Landa,** BriarTek, Inc. (USA); **Douglas A. Lauffenburger,** Massachusetts Institute of Technology (USA); **Soo-Young Lee,** KAIST (Korea, Republic of); **Kevin W. Lyons,** National Institute of Standards and Technology (USA); **Anke D. Meyer-Bäse,** The Florida State Univ. (USA); **Uwe Meyer-Baese,** The Florida State Univ. (USA); **Francesco Carlo Morabito,** Univ. Mediterranea di Reggio Calabria (Italy); **Hiroshi Nakajima,** OMRON Corp. (Japan); **Hyung-Min Park,** Sogang Univ. (Korea, Republic of); **Kitt C. Reinhardt,** Air Force Office of Scientific Research (USA); **Zuowei Shen,** National Univ. of Singapore (Singapore); **Metin Sitti,** Carnegie Mellon Univ. (USA); **Jan-Olov Stromberg,** Royal Institute of Technology (Sweden); **John Tangney,** Office of Naval Research (USA); **Emmanuel Vincent,** IRISA / INRIA Rennes (France); **Nadarajen A. Vydelingum,** National Institutes of Health (USA); **Lipo Wang,** Nanyang Technological Univ. (Singapore); **Olaf Wolkenhauer,** Univ. Rostock (Germany); **Donald C. Wunsch II,** Missouri Univ. of Science and Technology (USA); **Ning Xi,** Michigan State Univ. (USA); **Takeshi Yamakawa,** Fuzzy Logic Systems Institute (Japan); **Yiping Zhao,** The Univ. of Georgia (USA); **Xiaowei Zhuang,** Harvard Univ. (USA)

THURSDAY 23 APRIL

SESSION 1. . . . . THU 8:00 AM TO 9:40 AM

Biomedical Wellness Applications

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Remote stress detection using visible (RGB) camera, Balvinder Kaur, Sophia Moses, Megha Luthra, Vasiliki N. Ikonomidou, George Mason Univ. (USA) . . . . [9496-1]

Breast lesion segmentation using a three-dimensional active contours without edges approach with a GPGPU implementation, Anke Meyer-Baese, Florida State Univ. (USA). . . . . [9496-2]

Remotely detected differential pulse transit time as a stress indicator, Balvinder Kaur, Elizabeth Tarbox, Marty Cissel, Sophia Moses, Megha Luthra, Nhien Tran, Misha Vaidya, Vasiliki N. Ikonomidou, George Mason Univ. (USA) . . . . [9496-3]

High accuracy optical flow estimation based on robustification variants and novel computer-aided diagnosis systems applied to breast MRI, Anke Meyer-Baese, Florida State Univ. (USA) . . . . [9496-4]

Catheter ultrasound for cross-sectional imaging and drug delivery to vessel wall, John A. Hossack, Univ. of Virginia (USA) . . . . [9496-5]

SESSION 2 . . . . .THU 9:40 AM TO 10:40 AM

System Biology

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Quantitative analysis of integrated chromosome 19 transcriptomic and proteomic data sets derived from glioma cancer stem-cell lines, Anke Meyer-Baese, Florida State Univ. (USA) . . . . [9496-6]

Dynamical complex network theory applied to the therapeutics of brain malignancies, Anke Meyer-Baese, Florida State Univ. (USA) . . . . [9496-7]

A new EEG measure using the 1-D cluster variation method, Alianna J. Maren, Themasis Associates (USA) . . . . [9496-26]

SESSION 3 . . . . THU 11:00 AM TO 12:40 PM

Learning Theory and Applications

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Reducing weight precision of convolutional neural networks towards large-scale on-chip image recognition, Zhengping Ji, Ilia Ovsiannikov, Yibing Wang, Lilong Shi, Qiang Zhang, Samsung Semiconductor, Inc. (USA) . . . . [9496-8]

An evaluation into the effectiveness of machine learning algorithms in traffic pattern prediction using field and simulation data, Nnanna N. Ekedebe, Nicolas Dolphin, Towson Univ. (USA) . . . . [9496-9]

A generalized LDA framework through 6W, Jeffrey C. Jenkins, The Catholic Univ. of America (USA); Rutger Van Bergem, George Mason Univ. (USA); Charles Sweet, LoftMind, Inc. (USA); Eveline Vietsch, Georgetown Univ. Medical Ctr. (USA); Harold H. Szu, The Catholic Univ. of America (USA); Masud Cader, American Univ. (USA); Dalila Benachenhou, George Washington Univ. (USA) . . . . [9496-10]

Earth mover's distances of feature vectors in large data analyses, Henry Chu, Anurag Singh, Michael A. Pratt, Univ. of Louisiana at Lafayette (USA) . . . . [9496-11]

Compressive sensing solutions through minimax optimization, Liyi Dai, U.S. Army Research Office (USA) . . . . [9496-12]

Lunch Break and Exhibition Time . . . . Thu 12:40 pm to 2:00 pm

SESSION 4 . . . . .THU 2:00 PM TO 3:00 PM

Smart Sensor Systems, Miniaturization, and Applications

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Hypothesis on human eye perceiving optical spectrum rather than an image, Yufeng Zheng, Alcorn State Univ. (USA); Harold H. Szu, The Catholic Univ. of America (USA) . . . . [9496-13]

Radar sensing while optical displaying, Harold H. Szu, Charles C. Hsu, The Catholic Univ. of America (USA); Michael J. Wardlaw, Office of Naval Research (USA); Jefferson M. Willey, U.S. Naval Research Lab. (USA) . . . . [9496-14]

Optical sensing cameras, Harold H. Szu, The Catholic Univ. of America (USA); Jae Hoon Cha, A. Lynn Abbott, Virginia Polytechnic Institute and State Univ. (USA); Keith A. Krapels, The Univ. of Memphis (USA) . . . . [9496-15]

SESSION 5 . . . . THU 3:30 PM TO 5:30 PM

Unsupervised Learning and ICA

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

Automatic organization and signal processing of databases, Ronald R. Coifman, Plain Sight Systems, Inc. (USA). . . . . [9496-16]

VoIP attacks detection engine based on neural network, Jakub Safarik, Pavol Partila, Jaromir Tovarek, Martin Mikulec, Miroslav Voznak, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . . [9496-17]

Thermal image enhancement based on blind source separation and multiple spectral measurements, Jae Hoon Cha, U.S. Army Night Vision & Electronic Sensors Directorate (USA); A. Lynn Abbott, Virginia Polytechnic Institute and State Univ. (USA); Harold H. Szu, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9496-18]

Auxiliary function approach to independent component analysis and independent vector analysis, Nobutaka Ono, National Institute of Informatics (Japan). . . . . [9496-19]

How do artificial neural networks (ANNs) compare to partial least squares (PLS) for spectral interference correction in optical emission spectrometry?, Z. Li, X. Zhang, Vassili Karanassios, Univ. of Waterloo (Canada) . . . . [9496-20]

Biomining: bridging the gap between health and security LDA, Jeffrey C. Jenkins, The Catholic Univ. of America (USA); Christopher Frenchi, Christopher Newport Univ. (USA); Charles Sweet, LoftMind, Inc. (USA); Binh Q. Tran, Harold H. Szu, The Catholic Univ. of America (USA) . . . . [9496-21]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Detection of cardiac activity changes from human speech, Jaromir Tovarek, Pavol Partila, Miroslav Voznak, Jakub Safarik, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . . [9496-22]

FPGA-based realtime blind source separation with principal component analysis, Matthew Wilson, Uwe Meyer-Baese, Florida State Univ. (USA) . . . . [9496-23]

Independent component analysis algorithm FPGA design to perform real-time blind source separation, Uwe Meyer-Baese, Crispin Odom, Florida State Univ. (USA) . . . . [9496-24]

FRIDAY 24 APRIL

SESSION 6 . . . . .FRI 8:00 AM TO 12:00 PM

Award Session

Session Chair: **Harold H. Szu,** U.S. Army Research Office (USA)

CONFERENCE 9497

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9497

Mobile Multimedia/Image Processing, Security, and Applications 2015

Conference Chairs: **Sos S. Agaian,** The Univ. of Texas at San Antonio (USA); **Sabah A. Jassim,** The Univ. of Buckingham (United Kingdom); **Eliza Yingzi Du,** Qualcomm Inc. (USA)

Program Committee: **David Akopian,** The Univ. of Texas at San Antonio (USA); **Salim Alsharif,** Univ. of South Alabama (USA); **Vijayan K. Asari,** Univ. of Dayton (USA); **Cesar Bandera,** BanDeMar Networks (USA); **Chang Wen Chen,** Univ. at Buffalo (USA); **Reiner Creutzburg,** Fachhochschule Brandenburg (Germany); **Stephen P. DelMarco,** BAE Systems (USA); **Frederic Dufaux,** Telecom ParisTech (France); **Touradj Ebrahimi,** Ecole Polytechnique Fédérale de Lausanne (Switzerland); **Erlan H. Feria,** College of Staten Island (USA); **Phalguni Gupta,** Indian Institute of Technology Kanpur (India); **Yo-Ping Huang,** National Taipei Univ. of Technology (Taiwan); **Jacques Koreman,** Norwegian Univ. of Science and Technology (Norway); **Maryline Maknavicius,** TELECOM & Management SudParis (France); **Alessandro Neri,** Univ. degli Studi di Roma Tre (Italy); **Cheryl L. Resch,** Johns Hopkins Univ. Applied Physics Lab. (USA); **Haleh Safavi,** NASA Goddard Space Flight Ctr. (USA); **Harin Sellahewa,** The Univ. of Buckingham (United Kingdom); **Yuri Shukuryan,** National Academy of Sciences of Armenia (Armenia); **Viacheslav Voronin,** Don State Technical Univ. (Russian Federation); **Yue Wu,** Tufts Univ. (USA); **Yicong Zhou,** Univ. of Macau (Macao, China)

MONDAY 20 APRIL

SESSION 1. . . . . .MON 8:00 AM TO 12:10 PM

Innovative Image Processing Techniques

Session Chair: **Sos S. Agaian,** The Univ. of Texas at San Antonio (USA)

Segmentation of textured images based on descriptor's of local approximations, Alexander I. Sherstobitov, Don State Technical Univ. (Russian Federation); Dmitry V. Timofeev, South Federal Univ. (Russian Federation); Vladimir I. Marchuk, Don State Technical Univ. (Russian Federation); Sos S. Agaian, The Univ. of Texas at San Antonio (USA); Vyacheslav V. Voronin, Don State Technical Univ. (Russian Federation); Karen O. Egiazarian, Tampere Univ. of Technology (Finland). . . . .[9497-1]

Color image retrieval and analysis, Chen Gao, Karen Panetta, Tufts Univ. (USA); Sos S. Agaian, The Univ. of Texas at San Antonio (USA) . . . .[9497-2]

A nonparametric hypothesis testing approach to wavelet domain image fusion, Stephen P. DelMarco, BAE Systems (USA) . . . .[9497-3]

Improved patch-based learning for image deblurring, Dong Bo, Haopeng Zhang, Zhiguo Jiang, Beihang Univ. (China). . . . .[9497-4]

Intensity and resolution enhancement of local regions for object detection and tracking in wide area surveillance, Evan Krieger, Vijayan K. Asari, Saibabu Arigela, Theus Aspiras, Univ. of Dayton (USA) . . . .[9497-5]

Image restoration using 2D autoregressive texture model and structure curve construction, Viacheslav V. Voronin, Vladimir I. Marchuk, Alexander I. Sherstobitov, Don State Technical Univ. (Russian Federation); Ilya Svirin, CJSC "Nordavind" (Russian Federation); Sos S. Agaian, The Univ. of Texas at San Antonio (USA); Karen O. Egiazarian, Tampere Univ. of Technology (Finland). . . . .[9497-6]

Real-time, non-distortive multimedia content modification over TCP/IP networks, James C. Collins, Sos S. Agaian, The Univ. of Texas at San Antonio (USA) . . . .[9497-7]

European activities in civil applications of drones: an overview of remotely piloted aircraft systems (RPAS), Reiner Creutzburg, Fachhochschule Brandenburg (Germany) . . . .[9497-8]

Investigation of methods to search for the boundaries on the image and their use on lung hardware of methods finding saliency map, Evgeny Semenishchev, South-Russian State Univ. of Economics and Service (Russian Federation) . . . .[9497-9]

3D cluster-driven bilateral filter for speckle reduction in ultrasound images, Jinshan Tang, Zhilong Hu, Michigan Technological Univ. (USA) . . . . . .[9497-10]

Image enhancement using hierarchical Bayesian image expansion super resolution, Timothy Whitney, Jeremy Straub, Ronald Marsh, Univ. of North Dakota (USA). . . . .[9497-11]

Lunch Break . . . . .Mon 12:10 pm to 1:10 pm

SESSION 2 . . . . .MON 1:10 PM TO 3:10 PM

Security and Privacy

Session Chair: **Sabah A. Jassim,** The Univ. of Buckingham (United Kingdom)

Encryption for confidentiality of the network and influence of this to the quality of streaming video through network, Lukas Sevcik, Dominik Uhrin, Jaroslav Frnda, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . .[9497-12]

Tensor transform-based method of image encryption, Artyom M. Grigoryan, Bryan A. Wiatrek, Sos S. Agaian, The Univ. of Texas at San Antonio (USA) . . . .[9497-13]

On a simulation study of cyber-attacks on vehicle-to-infrastructure communication in intelligent transportation system, Nnanna N. Ekedebe, Wei Yu, Towson Univ. (USA); Houbing Song, West Virginia Univ. (USA); Chao Lu, Towson Univ. (USA). . . . .[9497-14]

Transform domain steganography with blind source separation, Ismail I. Jouny, Lafayette College (USA). . . . .[9497-15]

Information security trades in tactical wireless networks, Michael T. Kurdziel, Harris Corp. (USA) and Rochester Institute of Technology (USA); John A. Alvermann, Harris Corp. (USA). . . . .[9497-16]

A better detection of 2LSB steganography via standard deviation of the extended pairs of values, Omed S. Khalind, Benjamin Aziz, Univ. of Portsmouth (United Kingdom). . . . .[9497-37]

SESSION 3 . . . . MON 3:40 PM TO 5:00 PM

Detection and Localization

Session Chair: **Eliza Yingzi Du,** Qualcomm Inc. (USA)

Capon-based single snapshot DOA estimation in monostatic MIMO radar, Aboulnasr Hassanien, Moeness G. Amin, Yimin D. Zhang, Fauzia Ahmad, Villanova Univ. (USA). . . . .[9497-17]

Building occupant and asset localization and tracking using visible light communication, Kofi Nyarko, Samuel Mbugua, Christian Emiyah, Morgan State Univ. (USA) . . . .[9497-18]

Experimental studies of high-accuracy RFID localization with channel impairments, Eric Pauls, Yimin D. Zhang, Villanova Univ. (USA). . . . . .[9497-19]

Efficient target tracking with an ad-hoc networks of omni-directional sensors, Kalin Atanassov, Qualcomm MEMS Technologies, Inc. (USA); William S. Hodgkiss, Univ. of California, San Diego (USA) . . . .[9497-20]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 4 . . . . .TUE 8:00 AM TO 9:20 AM

Implementation and Applications

Session Chair: **Sos S. Agaian,** The Univ. of Texas at San Antonio (USA)

Nonparametric spectrum estimation using generalized coprime sampling, Si Qin, Yimin D. Zhang, Moeness G. Amin, Villanova Univ. (USA) . . . . . [9497-21]

On an investigation into intelligent transportation system (its) safety, and traffic efficiency applications, Nnanna N. Ekedebe, Nicolas Dolphin, Towson Univ. (USA). . . . . [9497-22]

Video sensor calibration by invoking video synopsis approach with external constraint criteria, Sumit Chakravarty, New York Institute of Technology (USA); Sherry Zhu, Nanjing Univ. of Post and Telecommunications (China) . . . [9497-35]

On the universe's cybernetics duality behavior, Erlan H. Feria, The College of Staten Island of the City Univ. of New York (USA) . . . . [9497-34]

SESSION 5 . . . . TUE 9:20 AM TO 11:30 AM

Modulation and Channel Estimation

Session Chair: **Sabah A. Jassim,**
The Univ. of Buckingham (United Kingdom)

A modified CMA equalizer for SOQPSK for aeronautical telemetry, Arlene Cole-Rhodes, Morgan State Univ. (USA). . . . . [9497-23]

Investigating inner and outer convolutional code structures in serially concatenated systems, John W. Nieto, Harris Corp. (USA) . . . . [9497-24]

On the use of serial concatenated codes as applied to quasi-coherent CPM, James A. Norris, John W. Nieto, Harris Corp. (USA) . . . . [9497-25]

Estimated availability of new wideband HF communications technology at high latitudes, Vivianne Jodalen, Norwegian Defence Research Establishment (Norway) . . . . [9497-26]

New cognitive detection techniques for multimedia signals, Sumit Chakravarty, New York Institute of Technology (USA); Yixuan Sun, Nanjing Univ. of Post and Telecommunications (China) . . . . [9497-36]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Simulating the performance of switched diversity with post-examining selection, Richard J. Wright, Harris Corp. (USA) . . . . [9497-27]

Parsimonious sidelobe control for transmit beamforming in MIMO radar with multidimensional arrays, Aboulnasr Hassanien, Yimin D. Zhang, Moeness G. Amin, Fauzia Ahmad, Villanova Univ. (USA) . . . . [9497-28]

Quaternion Fourier transform-based prediction of coding region in DNA sequences, Artyom M. Grigoryan, Sos S. Agaian, The Univ. of Texas at San Antonio (USA) . . . . [9497-29]

Inpainting for videos with dynamic objects using texture and structure reconstruction, Viacheslav V. Voronin, Vladimir I. Marchuk, Nikolay V. Gapon, Don State Technical Univ. (Russian Federation); Andrey Zhuravlev, Bauman Moscow State Technical Univ. (Russian Federation); Sos S. Agaian, The Univ. of Texas at San Antonio (USA); Karen O. Egiazarian, Tampere Univ. of Technology (Finland). . . . . [9497-30]

Assessment of heart rate variability based on mobile device for planning physical activity, Ilya Svirin, CJSC "Nordavind" (Russian Federation); Nadezhda Nabilskaya, TSEZIS LLC (Russian Federation); Vyacheslav V. Voronin, Don State Technical Univ. (Russian Federation) . . . . [9497-31]

Network synchronization for secure mobile communication, Chang-Woo Park, Korea Electronics Technology Institute (Korea, Republic of). . . . . [9497-32]

CONFERENCE 9498

Tuesday 21 April 2015 • Proceedings of SPIE Vol. 9498

Multisensor, Multisource Information Fusion: Architectures, Algorithms, and Applications 2015

Conference Chair: **Jerome J. Braun** (USA)

Program Committee: **Sheela V. Belur,** The Van Dyke Technology Group, Inc. (USA); **David P. Benjamin,** Pace Univ. (USA); **Belur V. Dasarathy,** Information Fusion Technologies (USA); **Michael Heizmann,** Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany); **Charles F. Hester,** U.S. Army Research, Development and Engineering Command (USA); **Mieczyslaw M. Kokar,** Northeastern Univ. (USA); **Damian M. Lyons,** Fordham Univ. (USA); **Mirela Popa,** Chemring Detection Systems, Inc. (USA); **Firooz A. Sadjadi,** Lockheed Martin Maritime Systems & Sensors (USA); **Pramod Kumar Varshney,** Syracuse Univ. (USA); **Shanchieh Jay Yang,** Rochester Institute of Technology (USA)

TUESDAY 21 APRIL

SESSION 1. . . . . .TUE 9:00 AM TO 10:20 AM

Information Fusion Approaches and Algorithms I

Session Chairs: **Jerome J. Braun,** (USA); **Damian M. Lyons,** Fordham Univ. (USA)

An asset valuation approach using fuzzy logic, Henry Leung, Univ. of Calgary (Canada) . . . . [9498-1]

Reliable sources and uncertain decisions in multisensor systems, Christian P. Minor, Nova Research, Inc. (USA); Kevin J. Johnson, U.S. Naval Research Lab. (USA) . . . . [9498-2]

Integration of a sense and avoid (SAA) sensor fusion system architecture in a UAS in the NAS human-in-the-loop (HITL) experiment simulation platform, William L. Fehlman II, Maria Consiglio, NASA Langley Research Ctr. (USA) . . . . [9498-3]

STAC: a new fusion model for complex scene characterization and semantic mapping, Zsolt Kira, Alan R. Wagner, Christopher J. Kennedy, Jason Zutty, Grady Tuell, Georgia Tech Research Institute (USA) . . . . . . [9498-4]

SESSION 2 . . . . .TUE 10:50 AM TO 12:10 PM

Information Fusion Approaches and Algorithms II

Session Chairs: **David Paul Benjamin,** Pace Univ. (USA); **Damian M. Lyons,** Fordham Univ. (USA)

Better-than-the-best fusion algorithm with application in human activity recognition, Nayeff Njjar, Shalabh Gupta, Univ. of Connecticut (USA) . . [9498-5]

A theoretical performance analysis of discrete data classification when fusing two features, Robert S. Lynch, Analytic Information Fusion Systems, LLC (USA) and Univ. of Connecticut (USA); Peter K. Willett, Univ. of Connecticut (USA) . . . . [9498-6]

Flight plan optimization, Anoop Dharmaseelan, Flight Focus (Singapore) and SIM Univ. (Singapore); Keyne D. Adistambha, Flight Focus (Singapore); Terence K. L. Goh, William Phay, SIM Univ. (Singapore) . . . . [9498-7]

Multisensory information-based real-world multimodal social interactions between a humanoid robot and a virtual human, S. M. Mizanoor Rahman, Clemson Univ. (USA). . . . .[9498-16]

Lunch Break and Exhibition Time . . . . Tue 12:10 pm to 1:40 pm

SESSION 3 . . . . TUE 1:40 PM TO 3:00 PM

Information Fusion Approaches and Algorithms III

Session Chairs: **Mirela Popa,** Chemring Detection Systems, Inc. (USA); **Charles F. Hester,** U.S. Army Research, Development and Engineering Command (USA)

Pragmatic open space box utilization: asteroid survey model using distributed objects management based articulation (DOMBA), Atif F. Mohammad, The Univ. of North Dakota (USA); Jeremy Straub, Univ. of North Dakota (USA). . . . . [9498-8]

Gaussian process based modeling and design of experiments for sensor calibration in drifting environments, Feng Yang, Zongyu Geng, Nianqiang Wu, West Virginia Univ. (USA) . . . . [9498-9]

Uncertainty modeling using copulas for classification, Onur Ozdemir, Boston Fusion Corp. (USA); Sora Choi, Syracuse Univ. (USA); Thomas G. Allen, Boston Fusion Corp. (USA); Pramod K. Varshney, Syracuse Univ. (USA); Karla K. Spriestersbach, Missile Defense Agency (USA) . . . . [9498-10]

Relationships between trust and power assistance levels in human-robot collaborative manipulation of objects with power-assist, S. M. Mizanoor Rahman, Clemson Univ. (USA); Ryojun Ikeura, Mie Univ. (Japan) . . . . . [9498-11]

SESSION 4 . . . . TUE 3:30 PM TO 4:50 PM

Information Fusion and Robotics

Session Chairs: **Damian M. Lyons,** Fordham Univ. (USA); **Jerome J. Braun** (USA)

Effects of using a 3D model on the performance of vision algorithms, Paul Benjamin, Pace Univ. (USA); Damian M. Lyons, Fordham Univ. (USA); Robert Lynch, Analytic Information Fusion Systems, LLC (USA) and Univ. of Connecticut (USA). . . . . [9498-12]

Combining voice and gesture recognition for improved control of UGVs and UAVs, Adrian Stoica, Christopher Assad, Michael Wolf, Jaakko T. Karras, Jet Propulsion Lab. (USA); Marco Arena, Politecnico di Torino (Italy); Randi Williams, Univ. of Maryland, Baltimore (USA) . . . . [9498-13]

Evaluation of parallel reduction strategies for fusion of sensory information from a robot team, Damian M. Lyons, Joseph Leroy, Fordham Univ. (USA) . . . . [9498-14]

Performance measurements of a mobile manipulator, Roger V. Bostelman, Jeremy A. Marvel, National Institute of Standards and Technology (USA) . . . . [9498-15]

PANEL DISCUSSION. . . . . .4:50 PM TO 5:30 PM

Moderator: **Jerome J. Braun** (USA)

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Novel design of a reduced sensory information-based small size and low weight variable impedance actuator for soft and compliant robotics applications, S. M. Mizanoor Rahman, Clemson Univ. (USA) . . . . [9498-17]

CONFERENCE 9499

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9499

Next-Generation Analyst III

Conference Chairs: **Barbara D. Broome,** U.S. Army Research Lab. (USA); **Timothy P. Hanratty,** U.S. Army Research Lab. (USA); **David L. Hall,** The Pennsylvania State Univ. (USA); **James Llinas,** Univ. at Buffalo (USA)

Program Committee: **Nina M. Berry,** Sandia National Labs., California (USA); **John S. Eicke,** U.S. Army Research Lab. (USA); **James Fink,** U.S. Army Intelligence Ctr. of Excellence (USA); **James Hendler,** Rensselaer Polytechnic Institute (USA); **Bob Madahar,** Defence Science and Technology Lab. (United Kingdom); **Paul Sajda,** Columbia Univ. (USA); **Alan Steinberg,** Georgia Tech Research Institute (USA); **Edward L. Waltz,** BAE Systems (USA)

MONDAY 20 APRIL

SESSION 1. . . . . MON 1:30 PM TO 3:10 PM

Exploitation of Social Media

Session Chair: **Barbara D. Broome,** U.S. Army Research Lab. (USA)

Hypothesis testing from social data, Md. Tanvir Al Amin, Univ. of Illinois at Urbana-Champaign (USA); Lance M. Kaplan, Jemin George, U.S. Army Research Lab. (USA); Boleslaw Szymanski, Rensselaer Polytechnic Institute (USA); Tarek Abdelzaher, Univ. of Illinois at Urbana-Champaign (USA) . . [9499-1]

Challenges in the use of social media data for the next generation analyst, William R. Grace, Robert Leskovich, The Pennsylvania State Univ. (USA) . . . . [9499-2]

Localized emotional barometer: sentiment analysis using Yik Yak data, W. Robert Leskovich, The Pennsylvania State Univ. (USA) . . . . [9499-3]

Employing socially driven techniques for framing, contextualization, and collaboration in complex analytical threads, Arthur Wollocko, Michael Farry, Martin Voshell, Michael Jenkins, Charles River Analytics, Inc. (USA) . . . . [9499-4]

Social network analysis realization and exploitation, Jack Davenport, James J. Nolan, Decisive Analytics Corp. (USA) . . . . [9499-5]

SESSION 2 . . . . MON 3:40 PM TO 5:00 PM

Advance Concepts I

Session Chair: **Timothy P. Hanratty,** U.S. Army Research Lab. (USA)

Interactive geospatial integration of multi-INT data, Craig A. Knoblock, Yao-Yi Chiang, Pedro Szekely, The Univ. of Southern California (USA) . . [9499-6]

Classification of short-lived objects using an adaptive assistance system, Nadia El Bekri, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany) . . . . [9499-7]

Recognition of human-vehicle interactions in group activities via multi-attributed semantic message generation, Vinayak Elangovan, Amir Shirkhodaie, Tennessee State Univ. (USA) . . . . [9499-8]

Topic periodicity discovery from text data, Jingjing Wang, Univ. of Illinois at Urbana-Champaign (USA); Hongbo Deng, Yahoo! Inc. (USA); Jiawei Han, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9499-9]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

TUESDAY 21 APRIL

SESSION 3 . . . . TUE 8:10 AM TO 9:50 AM

Emerging Technology

Session Chair: **Timothy P. Hanratty,** U.S. Army Research Lab. (USA)

A survey of tools and resources for the next generation analyst, David L. Hall, Jacob L. Graham, Emily Catherman, The Pennsylvania State Univ. (USA) . . . . [9499-10]

Addressing information management and dissemination challenges for the next-generation analyst, Jesse Kovach, Laurel C. Sadler, Niranjan Suri, Robert P. Winkler, U.S. Army Research Lab. (USA) . . . . [9499-11]

Next generation data harmonization, Justin M. Del Vecchio, CUBRC (USA) . . . . [9499-12]

Intelligence reach for expertise (IREx), James R. Schoening, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); Yonatan Schreiber, CUBRC (USA); Christina Hadley, QED Systems, LLC (USA). [9499-13]

Utilizing context for improved threat analysis, Eric G. Little, Geoff Gross, Modus Operandi, Inc. (USA) . . . . [9499-14]

SESSION 4 . . . . TUE 10:20 AM TO 12:00 PM

Human Machine Interaction

Session Chair: **David L. Hall,** The Pennsylvania State Univ. (USA)

Collaborative interactive visualization: exploratory concept, Marielle Mokhtari, Valérie Lavigne, Frédéric Drolet, Defence R&D - Valcartier (Canada) . . . . [9499-15]

Visualization approaches for displaying measures of sentiment, Sue E. Kase, Heather E. Roy, Daniel N. Cassenti, U.S. Army Research Lab. (USA) . . . . [9499-16]

Conversational sensemaking, Alun D. Preece, Cardiff Univ. (United Kingdom); Dave Braines, IBM United Kingdom Ltd. (United Kingdom); William Webberley, Cardiff Univ. (United Kingdom) . . . . [9499-17]

Collaborative human-machine analysis using a controlled natural language, David Mott, IBM United Kingdom Ltd. (United Kingdom); Donald R. Shemanski, The Pennsylvania State Univ. (USA); Cheryl A. Giammanco, U.S. Army Research Lab. (USA); Dave Braines, IBM United Kingdom Ltd. (United Kingdom) [9499-18]

Enhancing decision-making by leveraging human intervention in large-scale sensor networks, Enrico Casini, Florida Institute for Human & Machine Cognition (USA); Jessica Depree, Modus Operandi, Inc. (USA); Niranjan Suri, Florida Institute for Human & Machine Cognition (USA) and U.S. Army Research Lab. (USA); Jeffrey M. Bradshaw, Florida Institute for Human & Machine Cognition (USA); Teresa Nieten, Modus Operandi, Inc. (USA) . . . . [9499-19]

Lunch Break and Exhibition Time . . . . Tue 12:00 pm to 1:20 pm

CONFERENCE 9499

SESSION 5 . . . . .TUE 1:20 PM TO 3:00 PM

Advance Concepts II

Session Chair: **James Llinas,** Univ. at Buffalo (USA)

One decade of the DFIG model, Erik Blasch, Air Force Research Lab. (USA) . . . . [9499-20]

Combining human and machine processes (CHAMP), Moises Sudit, Univ. at Buffalo (USA); Michael Hirsch, Stetson Univ. (USA); David Sudit, BAE Systems (USA) . . . . [9499-21]

Composable systems, James Llinas, Univ. at Buffalo (USA); Kevin Barry, Lockheed Martin Corp. (USA) . . . . [9499-22]

Generalist analysts' at the edge and distributed analytics, Gavin Pearson, Bob Madahar, Defence Science and Technology Lab. (United Kingdom) . . . . [9499-23]

Argumentation and fusion of soft-hard information for threat prediction, Galina L. Rogova, Univ. at Buffalo (USA); Ronald R. Yager, Iona College (USA) . . . . [9499-24]

PANEL DISCUSSION . . . . 3:30 PM TO 5:00 PM

Next Generation Analytics Panel of Experts Discussion

Moderator: Barbara D. Broome, U.S. Army Research Lab. (USA)

INTERACTIVE POSTER SESSION
TUESDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Dealing with extreme data diversity: extraction and fusion from the growing types of document formats, Peter David, Nichole Hansen, James J. Nolan, Decisive Analytics Corp. (USA) . . . . [9499-25]

Towards an automated intelligence product generation capability, Timothy W. Hawes, Alison M. Smith, James J. Nolan, Decisive Analytics Corp. (USA) . . . . [9499-26]

Entity resolution using cloud computing, Alex James, CUBRC (USA) . . . . [9499-27]

SEE PROFESSIONAL DEVELOPMENT COURSES

CONFERENCE 9500

Wednesday–Friday 22–24 April 2015 • Proceedings of SPIE Vol. 9500

Quantum Information and Computation XIII

Conference Chairs: **Eric Donkor,** Univ. of Connecticut (USA); **Andrew R. Pirich,** ACP Consulting (USA); **Michael Hayduk,** Air Force Research Lab. (USA)

Conference Co-Chairs: **Michael R. Frey,** Bucknell Univ. (USA); **Samuel J. Lomonaco Jr.,** Univ. of Maryland, Baltimore County (USA); **John M. Myers,** Harvard Univ. (USA)

Program Committee: **Paul M. Alsing,** Air Force Research Lab. (USA); **Chip Brig Elliott,** Raytheon BBN Technologies (USA); **Reinhard K. Erdmann,** Advanced Automation Corp. (USA); **Michael L. Fanto,** Air Force Research Lab. (USA); **Louis H. Kauffman,** Univ. of Illinois at Chicago (USA); **Vladimir E. Korepin,** Stony Brook Univ. (USA); **Alexander V. Sergienko,** Boston Univ. (USA); **Tai Tsun Wu,** Harvard Univ. (USA)

WEDNESDAY 22 APRIL

SESSION 1. . . . . WED 1:00 PM TO 4:40 PM

QKD and Quantum Cryptography

Session Chairs: **Michael J. Hayduk,** Air Force Research Lab. (USA); **Michael L. Fanto,** Air Force Research Lab. (USA)

Towards secure networks using entangled photons and spins *(Invited Paper)*, Dirk R. Englund, Edward H. Chen, Tim Schroeder, Luozhou Li, Catherine Lee, Jacob C. Mower, Massachusetts Institute of Technology (USA) . . . [9500-1]

Performance limits for single-photons, correlated-photons, and entangled-photons for quantum key distribution over fiber optics network topologies, Eric Donkor, Fahad A. Althowibi, Ryan Williams, Univ. of Connecticut (USA) . . . . [9500-2]

A quadnat continuous-variable quantum key distribution using collated photons, Eric Donkor, Univ. of Connecticut (USA); Reinhard Erdmann, Advanced Automation Corp. (USA); David H. Hughes, Air Force Research Lab. (USA); Patrick D. Kumavor, Univ. of Connecticut (USA) . . . . [9500-3]

Quantum teleportation for key-less cryptography, Abhishek Parakh, Univ. of Nebraska at Omaha (USA) . . . . [9500-4]

Implementing Diffie?Hellman key exchange using quantum EPR pairs, Sayonnha Mandal, Abhishek Parakh, Univ. of Nebraska at Omaha (USA) . . . . [9500-5]

Provably secure time distribution for the electric grid, Amos M. Smith, Warren P. Grice, Phil G. Evans, Teja Kuruganti, Miljko Bobrek, Rapheal C. Pooser, Pavel Lougovski, Bing Qi, Oak Ridge National Lab. (USA) . . . . . [9500-6]

A modified QSS algorithm for distributing two party secret keys, Amos M. Smith, Warren P. Grice, Phil G. Evans, Benjamin J. Lawrie, Oak Ridge National Lab. (USA); Matthieu Legré, id Quantique SA (Switzerland); Pavel Lougovski, William Ray, Bing Qi, Oak Ridge National Lab. (USA). . . . . [9500-7]

Analysis of the secrecy of the running key in quantum encryption channels using coherent states of light, Vladimir V. Nikulin, David H. Hughes, John Malowicki, Vijit Bedi, Binghamton Univ. (USA) . . . . [9500-8]

Multidimensional manifold extraction for multicarrier continuous-variable quantum key distribution, Laszlo Gyongyosi, Budapest Univ. of Technology and Economics (Hungary) and Hungarian Academy of Sciences (Hungary); Sandor Imre, Budapest Univ. of Technology and Economics (Hungary) . [9500-9]

SESSION 2 . . . . WED 4:40 PM TO 6:20 PM

Quantum Imaging and Sensing

Session Chairs: **Samuel J. Lomonaco Jr.,** Univ. of Maryland, Baltimore County (USA); **Reinhard Erdmann,** Advanced Automation Corp. (USA)

Compressive quantum sensing, John C. Howell, Univ. of Rochester (USA); Gregory A. Howland, Air Force Research Lab. (USA); Samuel Knarr, Daniel Lum, James Schneeloch, Univ. of Rochester (USA) . . . . [9500-10]

Multi-path time-delay detection and estimation using a quantum annealer, John J. Tran, Information Sciences Institute (USA); Kevin J. Scully, Darren L. Semmen, Walter E. Lillo, The Aerospace Corp. (USA); Robert F. Lucas, Information Sciences Institute (USA). . . . . [9500-11]

Complementary imaging with compressive sensing, Gregory A. Howland, Air Force Research Lab. (USA) and Univ. of Rochester (USA); John C. Howell, James Schneeloch, Daniel Lum, Univ. of Rochester (USA) . . . . [9500-12]

Sensors based on quantum hyper-entanglement: efficiency and performance in the presence of other photon sources, James F. Smith III, U.S. Naval Research Lab. (USA) . . . . [9500-13]

Finding analytical solution for mirror inverse gate operations in quantum systems with diagonal interactions, Rudrayya C. Garigipati, Preethika Kumar, Wichita State Univ. (USA) . . . . [9500-14]

THURSDAY 23 APRIL

SESSION 3 . . . . .THU 8:00 AM TO 10:20 AM

Quantum Gates, Circuits, and Networks I

Session Chairs: **Eric Donkor,** Univ. of Connecticut (USA); **Samuel J. Lomonaco Jr.,** Univ. of Maryland, Baltimore County (USA)

Chip-scale quantum communications *(Invited Paper)*, Ryan M. Camacho, Paul S. Davids, Christopher T. DeRose, Mohan Sarovar, Junji Urayama, Sandia National Labs. (USA) . . . . [9500-15]

Quantum networks of trapped atomic ions *(Invited Paper)*, Christopher Monroe, Univ. of Maryland, College Park (USA) . . . . [9500-16]

Targeted single qubit gates with neutral atoms in a 3D optical lattice, David S. Weiss, Yang Wang, Aishwarya Kumar, The Pennsylvania State Univ. (USA) . . . . [9500-17]

Towards scalable quantum information processing with cold atoms and Rydberg blockade, Mark E. Saffman, Univ. of Wisconsin-Madison (USA) . . . . [9500-18]

Scalable quantum computing architecture with mixed species ion chains, Boris Blinov, John Wright, Tomasz Sakrejda, Richard Graham, Zichao Zhou, Carolyn Auchter, Thomas Noel, Univ. of Washington (USA). . . . . [9500-19]

High fidelity quantum information processing in surface ion traps, Jungsang Kim, Emily Mount, Daniel Gaultney, Stephen Crain, Geert Vrijsen, Duke Univ. (USA) . . . . [9500-20]

SESSION 4 . . . . .THU 10:50 AM TO 12:10 PM

Quantum Gates, Circuits and Networks II

Session Chairs: **Reinhard Erdmann,** Advanced Automation Corp. (USA); **John M. Myers,** Harvard Univ. (USA)

Superconducting metamaterials and qubits, Britton L. T. Plourde, Syracuse Univ. (USA) . . . . [9500-21]

An optimal fusion transformation for cluster state growth using only linear optical elements, Dmitry B. Uskov, Brescia Univ. (USA); Pavel Lougovski, Oak Ridge National Lab. (USA); Paul M. Alsing, Michael L. Fanto, Air Force Research Lab. (USA); Lev Kaplan, Tulane Univ. (USA); Amos M. Smith, Oak Ridge National Lab. (USA) . . . . [9500-22]

Functional role of tunneling in a programmable quantum annealer, Vadim N. Smelyanskiy, NASA Ames Research Ctr. (USA) . . . . [9500-23]

Induced dipole-dipole forbidden transitions in rare-earth elements and their prospects for quantum information processing, Eric Donkor, Ryan Williams, Fahad A. Althowibi, Univ. of Connecticut (USA). . . . . . . [9500-24]

Lunch Break and Exhibition Time . . . . Thu 12:10 pm to 1:40 pm

SESSION 5 . . . . THU 1:40 PM TO 3:20 PM

Quantum Measurements and Error Correction

Session Chairs: **Michael R. Frey,** Bucknell Univ. (USA); **Louis H. Kauffman,** Univ. of Illinois at Chicago (USA)

How often must we apply syndrome measurements?, Yaakov S. Weinstein, The MITRE Corp. (USA). . . . . [9500-25]

Random multipartite correlations measure pure multipartite entanglement, Minh C. Tran, Nanyang Technological Univ. (Singapore); Tomasz Paterek, Nanyang Technological Univ. (Singapore) and Ctr. for Quantum Technologies (Singapore); Wieslaw Laskowski, Univ. Gdanski (Poland); Francois Arnault, Univ. de Limoges (France); Borivoje Dakic, Vienna Ctr. for Quantum Science and Technology (Austria) and Univ. Wien (Austria) . . . . [9500-26]

Measuring arbitrarily accurate pulse compensation with randomized benchmarking, True Merrill, Georgia Tech Research Institute (USA); Chingiz Kabytayev, Georgia Institute of Technology (USA); Adam Meier, Georgia Tech Research Institute (USA); Kenneth R. Brown, Georgia Institute of Technology (USA) . . . . [9500-27]

Demonstrating continuous variable Einstein-Podolsky-Rosen steering with a finite number of measurements, James Schneeloch, Samuel Knarr, Gregory A. Howland, John C. Howell, Univ. of Rochester (USA) . . . . [9500-28]

Considerations on the collapse of the wave function, John F. Reintjes, Sotera Defense Solutions (USA); Mark Bashkansky, U.S. Naval Research Lab. (USA) . . . . [9500-29]

SESSION 6 . . . . THU 3:50 PM TO 6:10 PM

Quantum Information Science

Session Chairs: **Paul M. Alsing,** Air Force Research Lab. (USA); **Michael L. Fanto,** Air Force Research Lab. (USA)

Strong local passivity and system excitation energy, Michael R. Frey, Bucknell Univ. (USA) . . . . [9500-30]

Diagrammatic quantum mechanics, Louis H. Kauffman, Univ. of Illinois at Chicago (USA); Samuel J. Lomonaco Jr., Univ. of Maryland, Baltimore County (USA) . . . . [9500-31]

Fiber bundle approach to number scaling in physics and geometry, Paul Benioff, Argonne National Lab. (USA) . . . . [9500-32]

Consequences of recognizing unpredictability beyond quantum uncertainty, John M. Myers, Harvard Univ. (USA); Frederick H. Madjid, Consultant (USA) . . . . [9500-33]

Topological and geometrical quantum computation in cohesive homotopy type theory, Juan F. Ospina, Univ. EAFIT (Colombia) . . . . [9500-34]

Heterotic quantum and classical computing on a convergence space architecture, Howard A. Blair, Daniel R. Patten, Robert J. Irwin, David W. Jakel, Syracuse Univ. (USA) . . . . [9500-35]

Quantum probabilistic logic programming, Radhakrishnan Balu, U.S. Army Research Lab. (USA) . . . . [9500-36]

Theoretical analysis of on-chip linear quantum optical information processing networks, Stefan F. Preble, Jeffrey A. Steidle, Edwin E. Hach III, Rochester Institute of Technology (USA) . . . . [9500-37]

Geometric topological circuit diagrams for adiabatic quantum computation, Avishy Carmi, Ben-Gurion Univ. of the Negev (Israel); Daniel Moskovich, Tomasz Paterek, Nanyang Technological Univ. (Singapore)[9500-38]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Quantum random number generation algorithm realized by smartphone camera, Nan Wu, Kun Wang, Haixing Hu, Fangmin Song, Nanjing Univ. (China); Xiangdong Li, The City Univ. of New York (USA) . . . . [9500-49]

Absorption problems for three-state quantum walks, Kun Wang, Haixing Hu, Nan Wu, Fangmin Song, Nanjing Univ. (China); Xiangdong Li, The City Univ. of New York (USA). . . . . [9500-50]

FRIDAY 24 APRIL

SESSION 7 . . . . FRI 8:20 AM TO 10:00 AM

Quantum States and Quantum Entanglement I

Session Chairs: **John M. Myers,** Harvard Univ. (USA); **Paul M. Alsing,** Air Force Research Lab. (USA)

A bright PPKTP waveguide source of polarization entangled photons, Michael L. Fanto, Air Force Research Lab. (USA); Christopher C. Tison, Rome Research Corp. (USA) and Florida Atlantic Univ. (USA); Stefan F. Preble, Rochester Institute of Technology (USA); Paul M. Alsing, Air Force Research Lab. (USA) . . . . [9500-39]

High spectral purity silicon ring resonator photon-pair source, Stefan F. Preble, Rochester Institute of Technology (USA); Michael L. Fanto, Air Force Research Lab. (USA); Christopher C. Tison, Rome Research Corp. (USA) and Florida Atlantic Univ. (USA); Zihao Wang, Jeffrey A. Steidle, Rochester Institute of Technology (USA); Paul M. Alsing, Air Force Research Lab. (USA) . . [9500-40]

High heralding-efficiency of near-IR fiber coupled photon pairs for quantum technologies, P. Ben Dixon, Danna Rosenberg, Matthew E. Grein, MIT Lincoln Lab. (USA); Ryan S. Bennink, Oak Ridge National Lab. (USA); Veronika Stelmakh, Franco N. C. Wong, Massachusetts Institute of Technology (USA) . . . . [9500-41]

Parametric down conversion with a depleted pump and its relationship to the black hole information loss problem, Paul M. Alsing, Air Force Research Lab. (USA) . . . . [9500-42]

High-purity single-mode photon source for integrated quantum photonics, Xiyuan Lu, Wei C. Jiang, Jidong Zhang, Qiang Lin, Univ. of Rochester (USA) . . . . [9500-43]

SESSION 8 . . . . FRI 10:30 AM TO 11:50 AM

Quantum States and Quantum Entanglement II

Session Chairs: **Louis H. Kauffman,** Univ. of Illinois at Chicago (USA); **Michael R. Frey,** Bucknell Univ. (USA)

Coherently stimulated parametric down-conversion in quantum optical metrology, Christopher C. Gerry, Richard Birrittella, Anna Gura, Lehman College (USA) . . . . [9500-44]

Properties of antipodal atomic Schrödinger cat states, Christopher C. Gerry, Lehman College (USA); Edwin E. Hach III, Rochester Institute of Technology (USA) . . . . [9500-45]

States of photons with space-variant polarization, Enrique J. Galvez, Colgate Univ. (USA); Behzad Khajavi, Colgate Univ. (USA) and Florida Atlantic Univ. (USA); Xinru Cheng, Colgate Univ. (USA) and Univ. of Ottawa (Canada) [9500-46]

Entanglement as a mechanism for controlling distributed quantum systems, Samuel J. Lomonaco Jr., Univ. of Maryland, Baltimore County (USA); Louis H. Kauffman, Univ. of Illinois at Chicago (USA). . . . . [9500-47]

Superconducting circuitry for quantum electromechanical systems, Matthew LaHaye, Syracuse Univ. (USA) . . . . [9500-48]

CONFERENCE 9501

Thursday–Friday 23–24 April 2015 • Proceedings of SPIE Vol. 9501

Satellite Data Compression, Communications, and Processing XI

Conference Chairs: **Bormin Huang,** Univ. of Wisconsin-Madison (USA); **Chein-I Chang,** Univ. of Maryland, Baltimore County (USA)

Conference Co-Chairs: **Chulhee Lee,** Yonsei Univ. (Korea, Republic of); **Yunsong Li,** Xidian Univ. (China); **Qian Du,** Mississippi State Univ. (USA)

Program Committee: **Roberto Camarero,** Ctr. National d'Études Spatiales (France); **Lena Chang,** National Taiwan Ocean Univ. (Taiwan); **Yang-Lang Chang,** National Taipei Univ. of Technology (Taiwan); **Mitchell D. Goldberg,** National Oceanic and Atmospheric Administration (USA); **Allen H.-L. Huang,** Univ. of Wisconsin-Madison (USA); **Wenjiang Huang,** Institute of Remote Sensing and Digital Earth (China); **Roger L. King,** Mississippi State Univ. (USA); **José Fco. López,** Univ. de Las Palmas de Gran Canaria (Spain); **Sebastian López Suárez,** Univ. de Las Palmas de Gran Canaria (Spain); **Jarno Mielikainen,** Univ. of Eastern Finland (USA); **Daniela I. Moody,** Los Alamos National Lab. (USA); **Antonio J. Plaza,** Univ. de Extremadura (Spain); **Jordi Portell de Mora,** Institut d'Estudis Espacials de Catalunya (Spain); **Jeffery J. Puschell,** Raytheon Space & Airborne Systems (USA); **Shen-En Qian,** Canadian Space Agency (Canada); **Joan Serra-Sagrista,** Univ. Autònoma de Barcelona (Spain); **Xiaopeng Shao,** Xidian Univ. (China); **Meiping Song,** Dalian Maritime Univ. (China); **Carole Thiebaut,** Ctr. National d'Études Spatiales (France); **Behcet Ugur Töreyin,** Cankaya Univ. (Turkey); **Lifu Zhang,** Institute of Remote Sensing and Digital Earth (China)

THURSDAY 23 APRIL

SESSION 1. . . . . THU 8:30 AM TO 10:10 AM

Image Compression

Session Chair: **Bormin Huang,** Univ. of Wisconsin-Madison (USA)

Future CNES high-resolution remote sensing missions: novel image compression approaches for on-board processing units, Roberto Camarero, Carole Thiebaut, Christophe Latry, Mathieu Albinet, Jean-Marc Delvit, Ctr. National d'Études Spatiales (France) . . . . [9501-1]

Effects of compression on classification performance and discriminant information preservation in remotely sensed data, Chulhee Lee, Yonsei Univ. (Korea, Republic of); Jeoungyeol Baek, Yonsei Univ (Korea, Republic of); Sungwook Youn, Yonsei Univ. (Korea, Republic of) . . . . [9501-2]

Hyperspectral image compression using an online learning method, Behcet U. Töreyin, Irem Ulku, Cankaya Univ. (Turkey) . . . . [9501-3]

A novel compression for hyperspectral images based on invariant set multi-wavelets, Yongjun Li, Yunsong Li, Xidian Univ. (China) . . . . [9501-4]

FPGA based JPEG-LS encoder for onboard real-time lossless image compression, Yakup Murat Mert, TÜBİTAK BİLGEM İLTAREN (Turkey) [9501-5]

SESSION 2 . . . . THU 10:40 AM TO 12:00 PM

Image Processing I

Session Chair: **Chein-I Chang,** Univ. of Maryland, Baltimore County (USA)

Simplex volume analysis for finding endmembers in hyperspectral imagery, Hsiao-Chi Li, Univ. of Maryland, Baltimore County (USA); Meiping Song, Dalian Maritime Univ. (China); Chein-I Chang, Univ. of Maryland, Baltimore County (USA) . . . . [9501-6]

Super resolution imaging in remote sensing, Qiuhua Luo, Xiaopeng Shao, Lin Wang, Ligen Peng, Yi Wang, Xidian Univ. (China) . . . . [9501-7]

Hyperspectral image classification with a universal extreme learning machine, Qian Du, Mississippi State Univ. (USA); Wei Li, Beijing Univ. of Chemical Technology (China) . . . . [9501-8]

GSM-MR compression algorithm with two step sorting based on similarity analysis, Fei Cheng, Kai Liu, Jin Zhang, Wenwen Ding, Yunsong Li, Xidian Univ. (China) . . . . [9501-9]

Lunch Break and Exhibition Time . . . . Thu 12:00 pm to 1:30 pm

SESSION 3 . . . . THU 1:30 PM TO 3:10 PM

Image Processing II

Session Chair: **Chulhee Lee,** Yonsei Univ. (Korea, Republic of)

Pesticide residue quantification analysis by hyperspectral imaging sensors, Chein-I Chang, Univ. of Maryland, Baltimore County (USA); Yuan-Hsun Liao, Providence Univ. (Taiwan); Wei-Sheng Lo, Horng-Yuh Guo, Ching-Hua Kao, Tau-Meu Chou, Junne-Jih Chen, Taiwan Agricultural Research Institute Council of Agriculture, Executive Yuan (Taiwan); Chia-Hsien Wen, Providence Univ. (Taiwan); Chinsu Lin, National Chiayi Univ. (Taiwan); Hsian-Min Chen, Taichung Veterans General Hospital (Taiwan); Yen-Chieh Ouyang, National Chung Hsing Univ. (Taiwan); Chao-Cheng Wu, National Taipei Univ. of Technology (Taiwan); Shih-Yu Chen, National Yunlin Univ. of Science and Technology (Taiwan) . . . . [9501-10]

Adaptive sparse signal processing for discrimination of satellite-based radiofrequency (RF) recordings of lightning events, Daniela I. Moody, David A. Smith, Los Alamos National Lab. (USA) . . . . [9501-11]

An automatic fractional coefficient setting method of FODPSO for hyperspectral image segmentation, Weiying Xie, Yunsong Li, Xidian Univ. (China) . . . . [9501-12]

Optimizing the updated Goddard shortwave radiation weather research and forecasting (WRF) scheme for Intel many integrated core (MIC) architecture, Jarno Mielikainen, Bormin Huang, Hung-Lung A. Huang, Univ. of Wisconsin-Madison (USA). . . . . [9501-13]

Progressive band processing of orthogonal subspace projection in hyperspectral imagery, Hsiao-Chi Li, Yao Li, Cheng Gao, Univ. of Maryland, Baltimore County (USA); Meiping Song, Dalian Maritime Univ. (China); Chein-I Chang, Univ. of Maryland, Baltimore County (USA) . . . . [9501-14]

SESSION 4 . . . . THU 3:40 PM TO 5:40 PM

Image Processing III

Session Chair: **Yunsong Li,** Xidian Univ. (China)

Orthogonal projection based fully constrained spectral unmixing, Meiping Song, Dalian Maritime Univ. (China); Hsiao-Chi Li, Yao Li, Cheng Gao, Chein-I Chang, Univ. of Maryland, Baltimore County (USA) . . . . [9501-15]

Optical design for computing super-resolution imaging, Xiaopeng Shao, Jiaoyang Wang, Jie Xu, Xiaodong Chen, Xidian Univ. (China) . . . . [9501-16]

A multiple constrained signal subspace projection for target detection in hyperspectral images, Lena Chang, National Taiwan Ocean Univ. (Taiwan) . . . . [9501-17]

PCNN-based level set method of automatic mammographic image segmentation, Weiying Xie, Yunsong Li, Xidian Univ. (China) . . . . [9501-18]

Parallel implementation of WRF double moment 5-class cloud microphysics scheme on multiple GPUs, Melin Huang, Bormin Huang, Hung-Lung A. Huang, Univ. of Wisconsin-Madison (USA) . . . . [9501-19]

Richardson-Lucy deblurring for the star scene under a thinning motion path, Laili Su, Xiaopeng Shao, Lin Wang, Haixin Wang, Xidian Univ. (China) . . . . [9501-20]

CONFERENCE 9501

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

A novel super resolution camera mode00l, Xiaopeng Shao, Yi Wang, Jie Xu, Lin Wang, Fei Liu, Qiuhua Luo, Xiaodong Chen, Xidian Univ. (China) . . [9501-37]

Research on IR thermal emission polarization characteristics of smooth surface material, Fei Liu, Xiaopeng Shao, Bin Xiangli, Lin Wang, Ying Gao, Xidian Univ. (China) . . . . [9501-38]

A simulation method for analyzing infrared polarization scenes, Ying Gao, Xiaopeng Shao, Lin Wang, Fei Liu, Xidian Univ. (China) . . . . [9501-39]

A study of lighting detection and exposure algorithms for smart phones, Haixin Wang, Xiaopeng Shao, Lin Wang, Peng Gao, Laili Su, Xidian Univ. (China) . . . . [9501-40]

Blind image noise assessment based on local phase coherence, Lin Wang, Xiao Li, Xueyan Shi, Xiaopeng Shao, Yanyun Zhang, Xidian Univ. (China) . . . . [9501-41]

Research of ghost imaging with spatial light modulator, Xiaopeng Shao, Yang Zhang, Xue'en Wang, Lin Wang, Xidian Univ. (China) . . . . [9501-42]

A proof-concept optical design with super-resolution reconstruction, Xiaopeng Shao, Jie Xu, Jiaoyang Wang, Xiaodong Chen, Xidian Univ. (China) . . . . [9501-43]

Airborne experiment results for spaceborne atmospheric synchronous correction system, Wenyu Cui, Weining Yi, Lili Du, Xiao Liu, Anhui Institute of Optics and Fine Mechanics (China). . . . . [9501-51]

FRIDAY 24 APRIL

SESSION 5 . . . . FRI 8:00 AM TO 10:00 AM

Image Processing IV

Session Chair: **Qian Du,** Mississippi State Univ. (USA)

Finding endmember classes in hyperspectral imagery, Cheng Gao, Yao Li, Chein-I Chang, Univ. of Maryland, Baltimore County (USA). . . . [9501-21]

Skeleton-based action recognition using multiple sequence alignment, Wenwen Ding, Kai Liu, Fei Cheng, Jin Zhang, Yunsong Li, Xidian Univ. (China) . . . . [9501-22]

Support vector machine with adaptive composite kernel for hyperspectral image classification, Wei Li, Beijing Univ. of Chemical Technology (China); Qian Du, Mississippi State Univ. (USA) . . . . [9501-23]

Construction of WRF Stony Brook University 5-class scheme on Intel many integrated cores (MICs), Melin Huang, Bormin Huang, Hung-Lung A. Huang, Univ. of Wisconsin-Madison (USA) . . . . [9501-24]

Semi-supervised hyperspectral unmixing approach based nonnegative matrix factorization, Lifu Zhang, Taixia Wu, Nan Wang, Xia Zhang, Institute of Remote Sensing and Digital Earth (China) . . . . [9501-25]

Virtual dimensionality analysis for hyperspectral imagery, Drew Paylor, Li-Chien Lee, Chein-I Chang, Univ. of Maryland, Baltimore County (USA) . . . . [9501-26]

SESSION 6 . . . . FRI 10:30 AM TO 11:50 AM

Image Processing V

Session Chair: **Lifu Zhang,** Institute of Remote Sensing and Digital Earth (China)

A new detection algorithm for microcalcification clusters in mammographic screening, Weiying Xie, Yunsong Li, Xidian Univ. (China) . . . . [9501-27]

Adaptive nearest feature space approach to remote sensing image classification, Yang-Lang Chang, Min-Yu Huang, Zhen-Xian Wu, Jyh-Perng Fang, National Taipei Univ. of Technology (Taiwan); Lena Chang, National Taiwan Ocean Univ. (Taiwan) . . . . [9501-28]

Progressive band processing of pixel purity index for finding endmembers in hyperspectral imagery, Yao Li, Cheng Gao, Hsiao-Chi Li, Univ. of Maryland, Baltimore County (USA); Meiping Song, Dalian Maritime Univ. (China); Chein-I Chang, Univ. of Maryland, Baltimore County (USA) . . . . [9501-29]

Collaborative representation for hyperspectral image classification, Wei Li, Beijng Univ. of Chemical Technology (China); Qian Du, Mississippi State Univ. (USA) . . . . [9501-30]

Lunch Break . . . . Fri 11:50 am to 1:20 pm

SESSION 7 . . . . FRI 1:20 PM TO 3:20 PM

Image Processing VI

Session Chair: **Daniela I. Moody,** Los Alamos National Lab. (USA)

A vegetation classification method based on optimization of feature band set using hyperspectral remote sensing data, Xia Zhang, Lifu Zhang, Kun Shang, Yanli Sun, Institute of Remote Sensing and Digital Earth (China) . . . . [9501-31]

Accurate estimation of motion blur parameters in noisy remote sensing image, Xueyan Shi, Lin Wang, Xiao Li, Xiaopeng Shao, Hailing Bai, Xidian Univ. (China) . . . . [9501-32]

Further optimization of dynamics code of the advanced research weather research and forecasting (ARW) model for Intel Xeon Phi, Jarno Mielikainen, Bormin Huang, Hung-Lung A. Huang, Univ. of Wisconsin-Madison (USA) . . . . [9501-33]

A super resolution algorithm for degraded satellite image, Ligen Peng, Xiaopeng Shao, Lin Wang, Xiaodong Chen, Xidian Univ. (China). . . . . . [9501-34]

Hyperspectral vital sign signal analysis for medical data, Cheng Gao, Yao Li, Hsiao-Chi Li, Chein-I Chang, Univ. of Maryland, Baltimore County (USA); Peter F. Hu, Colin Mackenzie, Univ. of Maryland School of Medicine (USA) . . [9501-35]

Dehazing method through polarimetric imaging and multi-scale analysis, Lei Cao, Xiaopeng Shao, Fei Liu, Lin Wang, Xidian Univ. (China). . . . . . [9501-36]

Fiber Optic Sensors Program

This track highlights papers from both Defense + Security and Sensing Technology + Applications that showcase the latest in fiber optic sensors.

FIBER OPTIC SENSOR COURSES

Fundamentals of Fiber Optic Sensor Design and Technology

SC1160

Instructors: Eric Udd / Robert Lieberman
Schedule: Tuesday 21 April, 8:30 am - 5:30 pm
Price: $545 members / $640 non-members

Price includes the text *Fiber Optic Sensor Field Guide* (SPIE Press, 2015), by William B. Spillman and Eric Udd.

FIBER OPTIC SENSOR PRESENTATIONS

View the Fiber Optic Sensors and Applications XII conference (Conf. 9480) program at www.spie.org/st101 or see page 20.

(FOLLOWING PAPERS ORDERED NUMERICALLY BY CONFERENCE PAPER NUMBER)

A miniature fiber-optic sensor for high-resolution and high-speed temperature and flow sensing in ocean environment

PAPER 9459-19

Author(s): **Ming Han,** Univ. of Nebraska-Lincoln (USA), et al.
Conference 9459: Ocean Sensing and Monitoring VII
SESSION 4: Underwater Optical Imaging and Ranging II

In oceanography, the underwater thermal structures are critical for analyzing the energy events, monitoring material transfer, transmitting optical signals, etc. In this paper, we present an optical fiber sensor consisting of a thin piece of silicon wafer which forms a Fabry-Perot interferometer for the high-resolution and high-speed temperature profiling. A new data processing method has also been developed to reduce the signal-to-noise ratio of the system. Experimental results indicate that the fiber-optic temperature sensor can achieve a temperature resolution ~0.001 degree Celsius with a sampling frequency higher than 500 Hz. The ability of the sensor used as a water flow probe will also be demonstrated.

OEM fiber laser rangefinder for long-distance measurement

PAPER 9465-5

Author(s): **Alexandre Corman,** SensUp (France), et al.
Conference 9465A: Laser Radar Technology and Applications XX
SESSION 1: LIDAR Design/Demonstrations

SensUp designs, manufactures and commercializes OEM electro-optical systems based on laser technology. This presentation is focused on the development of the first OEM rangefinder based on fiber laser technology. The flexibility provided by this laser source coupled with the important peak power of solid-state lasers and the huge repetition rate of laser diodes, enable us to fit the SWAP requirements of the optronic market integrators. It actually turns out to be a real alternative to other technologies usually used in range finding systems.

Functional sensor material enabled harsh environment, high temperature optical sensors for energy applications

PAPER 9467-53

Author(s): **Paul R. Ohodnicki,** National Energy Technology Lab. (USA), et al.
Conference 9467: Micro- and Nanotechnology Sensors, Systems, and Applications VII
SESSION 10: Novel Harsh Environment Sensors for Energy Applications: Joint Session with Conferences 9467 and 9491

Opportunities exist for increasing efficiency and enabling new technology development in fossil-based power generation systems through embedded sensing at the highest value locations. Functional sensor materials can play an important role in enabling new sensor devices with unique functionality and improved stability. The in-house research team at the NETL has established an advanced sensor material program focused on research and development of sensing materials in parallel with demonstration on fabricated sensors under relevant conditions. A brief overview of the program and research team capabilities will be presented followed by recent breakthroughs of the on-going research and development efforts.

Ultra-high temperature fiber optical chemical sensors based on nano-porous metal oxides

PAPER 9467-54

Author(s): **Kevin P. Chen,** Univ. of Pittsburgh (USA), et al.
Conference 9467: Micro- and Nanotechnology Sensors, Systems, and Applications VII
SESSION 10: Novel Harsh Environment Sensors for Energy Applications: Joint Session with Conferences 9467 and 9491

This paper presents fiber optical gas sensors based on nano-porous metal oxide functional materials for high-temperature energy applications. A solution-based approach was used to produce nano-porous functional metal oxide and their dopant variants as sensing films, which was integrated on high-temperature stable FBGs in D-shaped silica fibers and sapphire fibers. The Bragg grating peaks were used to monitor the refractive index change and optical absorption loss due to the redox reaction between Pd-doped TiO_2 and hydrogen from the room temperature to 800C. The experimental results show the sensor's response is reversible for hydrogen concentration between 0.1 vol.% to 5 vol. %. The response time of the hydrogen sensor is <8s.

Phosphor-based fiber optic temperature sensors for harsh environments

PAPER 9467-55

Author(s): Nicholas Djeu, MicroMaterials, Inc. (USA), et al.
Conference 9467: Micro- and Nanotechnology Sensors, Systems, and Applications VII
SESSION 10: Novel Harsh Environment Sensors for Energy Applications: Joint Session with Conferences 9467 and 9491

Fiber optic temperature sensors based on Yb doped phosphors will be described. Two designs for the thermal probe have been successfully demonstrated. In the first design, the phosphor is a doped YAG in single crystal form and is grown directly onto one end of an undoped single crystal YAG fiber. When excited by a moderate-power diode laser, it can be operated up to 1,600 C. In the second approach, the phosphor is in the form of a doped ceramic YAG microsphere, butted against a silica fiber. With this design, operating temperatures up to 1,100 C can be reached using an LED.

LandSafe precision flight instrumentation system for rotorcraft operations in degraded environments

PAPER 9471-5

Author(s): **Pri Mamidipudi,** Optical Air Data Systems, LLC (USA), et al.
Conference 9471: Degraded Visual Environments: Enhanced, Synthetic, and External Vision Solutions 2015
SESSION 1: DVE Sensors I

Helicopter hover, landing, and take-off operations in darkness, dust, fog, rain, snow, and high winds is an integral part of military and commercial flight operations. OADS has developed and flight-tested a standalone LDV-based optical sensor suite capable of precisely measuring and reporting height above ground, groundspeed, ground drift, and air data at an FCS capable data rate from a helicopter platform under all environmental conditions. Details about the sensor and recent flight test results from multiple platforms will be presented.

A plastic optical fiber biosensor for e. coli

PAPER 9486-29

Author(s): **Domingos M. C. Rodrigues,** Univ. Federal of Rio de Janeiro (Brazil), et al.
Conference 9486: Advanced Environmental, Chemical, and Biological Sensing Technologies XII
TUESDAY POSTER SESSION: Interactive Poster Session: Tuesday Evening

This work presents a plastic optic fiber biosensor to detect Escherichia coli. Different probe shapes were tested: U-shaped with different radiuses, coil-shaped and meander-shaped. In calibration, we used solutions of sucrose for obtaining refractive indexes in the range 1.33 – 1.39 equivalent to water and bacteria, respectively. The setup consists of a LED connected to the probe and driven by microcontroller. In the opposite fiber end, the light received by a photodiode is amplified, and the output voltage varies accordingly to the captured bacteria. Measurement results for concentration readings of 104 CFU/mL are obtained in less than 10 minutes.

Light-directed functionalization methods for high-resolution optical fiber based biosensors

PAPER 9486-5

Author(s): Leyla N. Kahyaoglu, Purdue Univ. (USA), et al.
Conference 9486: Advanced Environmental, Chemical, and Biological Sensing Technologies XII
SESSION 2: Biosensors II

Implementation of a novel fiber-optic Fourier transform infrared (FO-FTIR) spectroscopy approach for non-contact and label-free sensing of biochemical contamination

PAPER 9487-12

Author(s): **Moinuddin Hassan,** U.S. Food and Drug Administration (USA), et al.
Conference 9487: Smart Biomedical and Physiological Sensor Technology XII
SESSION 3: Regulation and Monitoring

Healthcare associated infections (HAI) in clinics and hospitals are a major concern to public safety. Reusable medical devices can serve as a reservoir of infectious agents as they repeatedly come into contact with multiple patients and healthcare professionals. In order to reduce HAIs from reusable devices, alternative methods for quantitative, accurate, easy-to-use and real-time detection and identification of microorganism contaminations on medical devices surfaces in clinical setting are needed. We have developed a fiber-optic Fourier transform infrared (FO-FTIR) spectroscopy based sensing platform for non-contact, label-free and real-time detection of pathogens such as E.coli, S.aureus etc. on medical device surfaces.

Potential of commercial single-mode optical fibers as distributed sensors for high temperature measurement with PPP-BOTDA

PAPER 9491-10

Author(s): **Yi Bao,** Missouri Univ. of Science and Technology (USA), et al.
Conference 9491: Sensors for Extreme Harsh Environments II
SESSION 3: Optical Sensing Technology for Harsh Environments I

A commercial single-mode optical fiber is used as a distributed sensor to measure temperatures up to 1000ºC. The optical fiber was protected by a heat resistant glass tube with inside and outside diameters of 4 mm and 8 mm, respectively. The glass tube was heated at a thermal gradient of 8°C/min until 1000°C, and then was monotonously cooled to room temperature (22°C) in a thermostatic chamber. The distribution of Brillouin frequency shifts along each fiber were measured by a Neubrescope (Model NBX-7020) at different temperatures with pulse pre-pump Brillouin optical time domain analysis (PPP-BOTDA). The accuracy of temperature measurement is ±2°C. The measurement repeatability and spatial resolution are ±1°C and 4 cm, respectively.

Optical fiber distributed temperature and distributed acoustic sensing for remote and harsh environments

PAPER 9491-13

Author(s): **Michael Mondanos,** Silixa Ltd. (United Kingdom), et al.
Conference 9491: Sensors for Extreme Harsh Environments II
SESSION 4: Optical Sensing Technology for Harsh Environments II

Advances in opto-electronics and associated signal processing have enabled the development of optical fibre distributed acoustic and temperature sensors. Unlike systems relying on discrete optical sensors a distributed system does not rely upon manufactured sensors but utilises passive custom optical fibre cables resistant to harsh environments, including high temperature applications. These systems have been developed for the oil and gas industry to assist reservoir engineers in optimising the well lifetime. Nowadays these systems find a wide variety of applications as integrity monitoring tools .

Analysis of the coupling optical fiber ultrasonic sensor for partial discharges detection

PAPER 9491-15

Author(s): **Fengmei F. Li,** Xi'an Jiaotong Univ. (China), et al.
Conference 9491: Sensors for Extreme Harsh Environments II

Author(s): **Sudeep Mandal,** GE Global Research (USA), et al.
Conference 9491: Sensors for Extreme Harsh Environments II
SESSION 3: Optical Sensing Technology for Harsh Environments I

Fiber optic distributed temperature sensing based on Raman scattering of light in optical fibers has become a very attractive solution for distributed temperature sensing (DTS) applications. Currently, most Raman DTS instruments and fiber sensors are designed for operation up to approximately 300?C. We will present our work in demonstrating high temperature calibration of a Raman DTS system and describe the challenges of measuring large temperature ranges (0 – 600?C) with a single DTS interrogator. We will demonstrate the need to customize interrogator electronics and detector response in order to achieve reliable and repeatable high temperature measurements across a wide temperature range.

Coherent probe-pump-based Brillouin sensor for harsh environments

PAPER 9491-9

Author(s): **L. F. Zou,** OZ Optics Ltd. (Canada), et al.
Conference 9491: Sensors for Extreme Harsh Environments II
SESSION 3: Optical Sensing Technology for Harsh Environments I

A coherent probe-pump-based Brillouin sensor has been used for some harsh environments, such as leakage detection of oil and gas pipeline, monitoring of thunderstorms and rime ice on electricity power line, and monitoring of nuclear waste repository. The small leakage can be detected in five minutes after a leakage happened and the temperature change caused by the leakage increased with time during 15 minutes leakage operating. The effects of thunderstorms and rime ice on the power line were identified by monitoring strain on an OPGW with 140km optical fiber. The fiber types at high gamma doses that represent the harsh environment constraints associated with the considered application have been investigated by the coherent probe-pump-based Brillouin sensor.

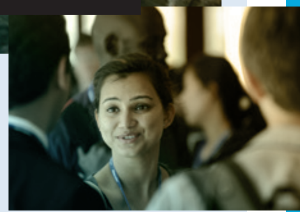
Plan to Attend



We invite you to attend SPIE Defense + Security 2015, the leading meeting for scientists, researchers and engineers from industry, military, government agencies, and academia throughout the world. For more than 25 years Defense + Security has been one of the largest defense technology meetings worldwide, and it is the key event featuring optics, imaging, and sensing.

One of the strengths of Defense + Security is its central location in the Baltimore Inner Harbor, close to the center of many U.S. Federal Government offices/agencies and many of the largest defense/security contractors and aerospace companies in America. Defense + Security is a prime event for government acquisition, policy, and program executive representatives. This year Defense + Security has 32 separate conferences spanning all 5 days of the symposium, with over 1200 presentations.

We look forward to an even closer and stronger partnership with you during SPIE Defense + Security 2015.

Nils Sandell, *Symposium Chair*
Director, Strategic Technology Office/DARPA (USA)

David A. Logan, *Symposium Co-Chair*
Vice President and General Manager of Technology Solutions, BAE Systems

CONTENTS

GREEN PHOTONICS Cutting-edge developments in photonics-driven green technologies and applications. such as energy, sustainability, conservation, and environmental monitoring. Watch for this icon next to conferences discussing innovative ways to help our planet.

BEST PAPER AND BEST STUDENT PAPER AWARDS

The list of awards for the Defense + Security symposium may be updated as new awards are added.

Head- and Helmet-Mounted Displays XX: Design and Applications
(Conference 9470B)

Special emphasis will be placed on university research in general, and student conceived and executed research in particular. As an incentive, a non-monetary award for Best Student Paper will be given.

Display Technologies and Applications for Defense, Security, and Avionics IX
(Conference 9470A)

Each year, Best Paper Award is given based on originality, depth of research, significance of findings and/or historical interest. The award is based primarily on the oral presentation and is a joint decision stemming from input by conference committee members and chairs. The winner is determined shortly after the meeting, and notified by the conference chairs.

Signal Processing, Sensor/Information Fusion, and Target Recognition XXIV
(Conference 9474)

Commencing in 2015, a conference awards committee will be established to evaluate the submitted papers and associated presentation to select the Young Researcher Best Paper Award.

Algorithms for Synthetic Aperture Radar Imagery XXII
(Conference 9475)

In order to be considered for this award, the student must be the presenter and the primary author. A panel of experts will evaluate the papers, both for quality and content with regard to: 1) innovation, clarity, and style, and 2) the importance of the work to the field.

Automatic Target Recognition XXV
(Conference 9476)

ANNOUNCING THE 2015 ATR BEST PAPER AWARDS

Lockheed Martin Corporation has generously offered to sponsor the Best Paper Awards for the Automatic Target Recognition (ATR) conference, which will be held in Baltimore, Maryland, 20-24 May 2015. One or more in each category are planned: Best Student Paper Award and Best Paper Award.

In order to be considered for these awards:

- Presenter must make their oral presentation as scheduled
  Manuscript must be submitted to SPIE no later than the week of 23 March 2015.

SPONSORED BY

LOCKHEED MARTIN

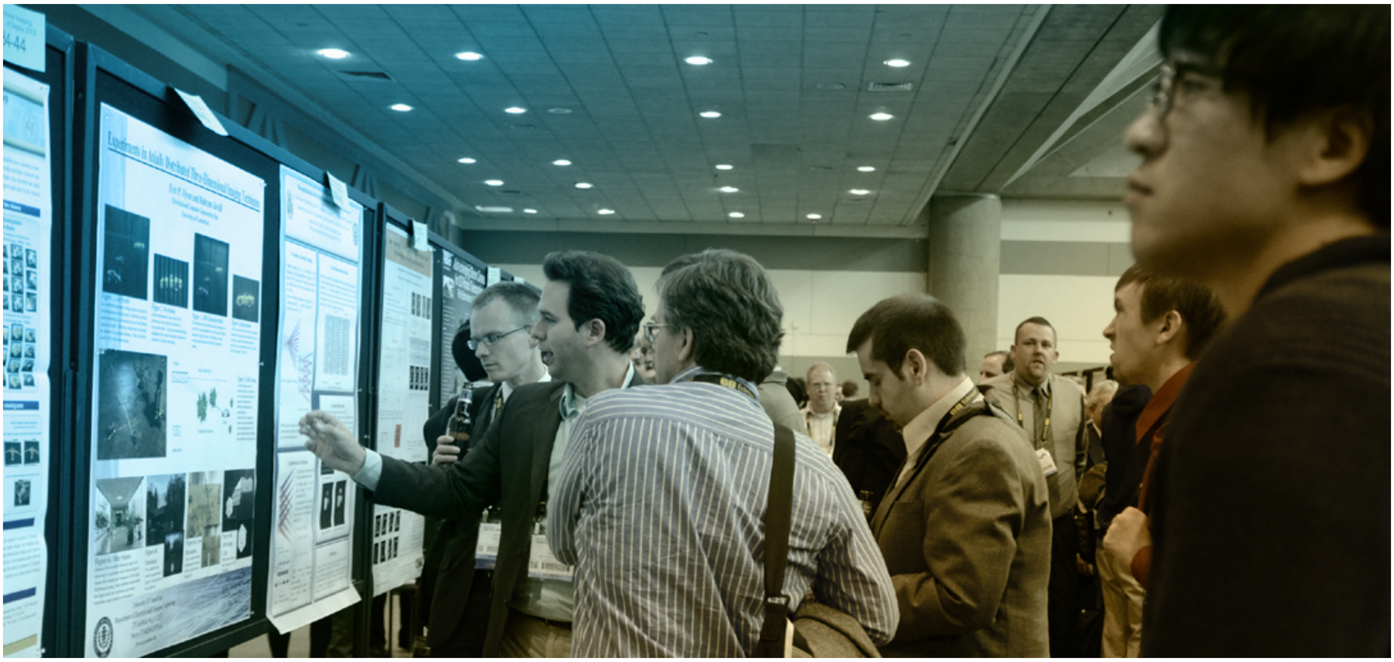
BEST STUDENT PAPER AWARDS

FOR STUDENTS: In addition to the above requirements, to be considered for the Best Student Paper Award:

- Student must be the presenting author at the conference
- Student must be the leading author of the manuscript
- Student must send a message to the conference chairs identifying them/you as a student. This should be done after you have submitted your abstract, and must include your Tracking Number and Paper Title.

Please send to:
Firooz Sadajdi - firooz.a.sadjadi@lmco.com
and
Abhijt Mahalanobis - abhijit.mahalanobis@lmco.com

A panel of experts headed by the ATR conference chairs will evaluate all the papers, both for quality and content. Attention will be given to 1) the innovation, clarity, and style of both the oral presentation at the conference and the manuscript submitted for publication, and 2) the importance of the work to the field of ATR. The winners will be recognized in person at the 2015 ATR conference. They will also be formally notified by email, and will receive a certificate of award.



AWARD ELIGIBILITY REQUIREMENTS FOR CONFERENCES:

Infrared Technology and Applications XLI (Conference 9451)

Chemical, Biological, Radiological, Nuclear, and Explosives (CBRNE) Sensing XVI (Conference 9455)

Micro- and Nanotechnology Sensors, Systems, and Applications VII (Conference 9467)

Geospatial Informatics, Fusion, and Motion Video Analytics V (Conference 9473)

CRITERIA FOR BEST PAPER AWARDS

In order to be considered for a Best Paper Award:

Presenter must make their oral or poster presentation as scheduled.

Manuscript must be submitted to the Proceedings of SPIE. The award decision is based on manuscript submission.

Please see the conference award description above and conference website to check for possible additional requirements.

EVALUATION PROCESS

A panel coordinated by the Conference Chairs will evaluate all manuscripts submitted for consideration of high quality content. Attention may be given to 1) the innovation, clarity, and style of both the presentation at the conference and the manuscript submitted for publication, and 2) the importance of the work in the field.

Please contact your Conference Program Coordinator, Pat Wight, at patw@spie.org with any questions. Thank you for your interest!

Monday 20 April

OPENING REMARKS . . . . 8:00 AM TO 8:10 AM

Gabor F. Fulop , Maxtech International, Inc. (USA)

SESSION 1. . . . . MON 8:10 AM TO 10:10 AM

NIR / SWIR FPAs and Applications

Session Chairs: **Mario O. Münzberg,** Airbus DS Optronics GmbH (Germany); **Eric M. Costard,** SOFRADIR (France)

Improved sensitivity performance of SWIR imager in a multispectral VIS/SWIR zoom camera for long-range surveillance tasks, Martin Huebner, Bertram Achtner, Michael Kraus, Mario O. Münzberg, Airbus DS Optronics GmbH (Germany). . . . . [9451-1]

Smart onboard image enhancement algorithms for SWIR day and night vision camera, Jo Das, Koen Vanhoof, Guy Gielis, Benedict Gouverneur, Pieter D. Deroo, Xenics NV (Belgium); Raf L. P. Vandersmissen, sInfraRed Pte. Ltd. (Singapore); Jan P. Vermeiren, Xenics NV (Belgium); Patrick J. Merken, Xenics NV (Belgium) and Royal Military Academy (Belgium) . . . . [9451-2]

Low-cost SWIR imaging: demonstration of a colloidal quantum dot focal plane array, Ethan J. D. Klem, Christopher W. Gregory, Dorota S. Temple, Jay S. Lewis, RTI International (USA) . . . . [9451-3]

InGaAs focal plane array developments and perspectives, Anne Rouvié, Jérôme Coussement, Odile Huet, Jean-Patrick Truffer, Maxime Pozzi, El-Houcine Oubensaid, Sébastien Hamard, Vincent Chaffraix, Eric M. Costard, SOFRADIR (France). . . . . [9451-4]

Low light level CMOS sensor for night vision camera, Elad Gross, Ran Ginat, Ofer Nesher, Elbit Systems Ltd (Israel) . . . . [9451-5]

IR CMOS: the digital nightvision solution to sub-1 mLux imaging, Martin U. Pralle, James E. Carey III, Chris J. Vineis, SiOnyx Inc. (USA) . . . . [9451-6]

SESSION 2 . . . . MON 10:40 AM TO 11:30 AM

Infrared in the Service of the Navy I

Session Chair: **James R. Waterman,** U.S. Naval Research Lab. (USA)

Semi-scanning single sensor omni-directional observation system *(Invited Paper)*, Yan Itovich, Dan V. Regelman, Rafael Advanced Defense Systems Ltd. (Israel) . . . . [9451-8]

Considerations for opto-mechanical versus digital stabilization in surveillance systems *(Invited Paper)*, David Kowal, CONTROP Precision Technologies Ltd. (Israel) . . . . [9451-9]

Lunch Break . . . . Mon 11:30 am to 1:00 pm

SESSION 3 . . . . MON 1:00 PM TO 1:40 PM

Infrared in the Service of the Navy II

Session Chair: **James R. Waterman,** U.S. Naval Research Lab. (USA)

Naval piracy acts: design of an infrared multiple cameras system for short-range detection and targeting *(Invited Paper)*, Dominique Maltese, Sagem Défense Sécurité (France) . . . . [9451-10]

TBD on naval system, ... [9451-11]

SESSION 4 . . . . MON 1:40 PM TO 3:00 PM

Infrared Imagers: Variations On a Theme

Session Chairs: **R. Kennedy McEwen,** SELEX ES (United Kingdom); **Torbjørn Skauli,** Norwegian Defence Research Establishment (Norway)

Future of clip-on weapon sights: pros and cons from an applications perspective, Glen L. Francisco, C. Reed Knight Jr., Ken Greenslade, Knight's Armament Co. (USA) . . . . [9451-12]

Development of an infrared ultra-compact multichannel camera integrated in a SOFRADIR's detector Dewar cooler assembly, Guillaume Druart, Florence de la Barrière, Nicolas Guérineau, Aurélien Plyer, ONERA (France); Gilles Lasfargues, Eric D. de Borniol, Commissariat à l'Énergie Atomique (France); Serge Magli, SOFRADIR (France). . . . . [9451-13]

Spin scan tomographic infrared imager, Harald Hovland, Norwegian Defence Research Establishment (Norway) . . . . [9451-14]

TBD on hyperspectral imager, ... [9451-15]

SESSION 5 . . . . .MON 3:30 PM TO 4:30 PM

Infrared Imaging: Retaining Acquisition

Session Chairs: **Torbjørn Skauli,** Norwegian Defence Research Establishment (Norway); **R. Kennedy McEwen,** SELEX ES (United Kingdom)

Minimising blooming in MWIR missile launch systems, Patrick R. Body, TECNOBIT (Spain). . . . . [9451-16]

Passive electro optical counter-countermeasures, Ariela Donval, Tali Fisher, Moshe Oron, KiloLambda Technologies, Ltd. (Israel) . . . . [9451-17]

Daylight coloring for monochrome infrared imagery, James Gabura, Raytheon ELCAN Optical Technologies (Canada) . . . . [9451-18]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 6 . . . . .TUE 8:00 AM TO 9:30 AM

Type II Superlattice FPAs I

Session Chairs: **Meimei Tidrow,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Manijeh Razeghi,** Northwestern Univ. (USA); **Lucy Zheng,** Institute for Defense Analyses (USA)

In/As/InAs$_{1-x}$Sb$_x$ type-II superlattices for high-performance long-wavelength infrared detection *(Invited Paper)*, Manijeh Razeghi, Abbas Haddadi, Guanxi A. Chen, R. Chevallier, Anh Minh Hoang, Northwestern Univ. (USA) . . . . [9451-19]

Type-II superlattice detector for long-wave infrared imaging *(Invited Paper)*, Philip C. Klipstein, Eran Avnon, Yael Benny, Avraham Fraenkel, Alex Glozman, Elad Ilan, Ezra Kahanov, Olga Klin, Lidia Langof, SCD SemiConductor Devices (Israel); Yoav Livneh, Israel Ministry of Defense (Israel); Inna Lukomsky, Michal Nitzani, Lior Shkedy, Itay Shtrichman, Noam Snapi, Ron Talmor, SCD SemiConductor Devices (Israel); Avi Tuito, IMOD (Israel); Shay Vaserman, Eliezer Weiss, SCD SemiConductor Devices (Israel) . . . . [9451-20]

InAs/Ga(In)Sb type-II superlattices short/middle dual-color infrared detectors *(Invited Paper)*, Yanli Shi, Kunming Institute of Physics (China) . . . . [9451-21]

SESSION 7 . . . . TUE 9:30 AM TO 10:00 AM

Keynote Session

Session Chair: **Paul R. Norton,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

TBD *(Keynote Presentation)*, Donald Reago, U.S. Army REDECOM CERDEC NVESD (USA) . . . . [9451-22]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Tuesday morning coffee break while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 8 . . . . TUE 1:00 PM TO 4:40 PM

Type II Superlattice FPAs II

Session Chairs: **Meimei Tidrow,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Manijeh Razeghi,** Northwestern Univ. (USA); **Lucy Zheng,** Institute for Defense Analyses (USA)

High-performance bias-selectable dual-band mid-/long-wavelength infrared photodetectors based on InAs/InAs$_{1-x}$Sb$_x$ type-II superlattices *(Invited Paper)*, Manijeh Razeghi, Abbas Haddadi, R. Chevallier, Guanxi A. Chen, Anh Minh Hoang, Northwestern Univ. (USA). . . . . [9451-23]

Limiting dark current mechanisms in antimony-based superlattice infrared detectors for the mid- and long-wavelength infrared regime, Robert Rehm, Volker Daumer, Tsvetlina Hugger, Norbert Kohn, Florian Lemke, Wolfgang Luppold, Jasmin Niemasz, Johannes Schmidt, Johannes Schmitz, Frank Rutz, Tim O. Stadelmann, Matthias Wauro, Andreas Wörl, Martin Walther, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany). . . . . [9451-24]

Modeling of the InAs/GaSb superlattices performance, Julien Imbert, ONERA (France); Virginie Trinite, III-V Lab. (France); Sophie Derelle, Julien Jaeck, ONERA (France); Jean-Baptiste Rodriguez, Institut d'Electronique du Sud (France); Riad Haidar, ONERA (France); Mathieu Carras, III-V Lab. (France); Philippe Christol, Institut d'Electronique du Sud (France). . . . . [9451-25]

Carrier transport in unipolar barrier infrared detectors, David Z. Ting, Alexander Soibel, Linda Höglund, Cory J. Hill, Arezou Khoshakhlagh, Sam A. Keo, Anita M. Fisher, Layton Baker, Edward M. Luong, Robert S. Kowalczyk, John K. Liu, Jason M. Mumolo, Sir B. Rafol, Sarath D. Gunapala, Jet Propulsion Lab. (USA) . . . . [9451-26]

Minority carrier lifetimes in InAs/InAsSb type-II superlattices measured using double-modulation time-resolved photoluminescence, Zhiyuan Lin, Shi Liu, Yong-Hang Zhang, Arizona State Univ. (USA) . . . . [9451-27]

TBD *(Invited Paper)*, ... [9451-28]

Confocal Raman spectroscopy and AFM for evaluation of sidewalls in type-II superlattices, Alexander A. Ukhanov, Tito L. Busani, Pranav Rathi, Thomas J. Rotter, Felix Jaeckel, Kevin J. Malloy, Actoprobe LLC (USA); Elena Plis, Sanjay Krishna, SKINfrared LLC (USA); Neil F. Baril, J. D. Benson, Marvin Jaime-Vasquez, U.S. Army RDECOM CERDEC NVESD (USA); Dmitri A. Tenne, Boise State Univ. (USA). . . . . [9451-29]

Growth and characterization of ≥6" epitaxy-ready GaSb substrates for use in large-area infrared detector applications, Mark J. Furlong, IQE IR (United Kingdom); Rebecca J. Martinez, Marius Tybjerg, Andrew Mowbray, Brian Smith, Wafer Technology Ltd. (United Kingdom) . . . . [9451-30]

MBE growth of Sb-based bulk nBn infrared photodetector structures on ≥6" GaSb substrates, Amy W. K. Liu, Dmitri Loubychev, Yueming Qiu, Joel M. Fastenau, IQE Inc. (USA); Mark J. Furlong, IQE IR (United Kingdom); Marius Tybjerg, Wafer Technology Ltd. (United Kingdom); Rebecca J. Martinez, IQE IR (United Kingdom); Andrew Mowbray, Brian Smith, Wafer Technology Ltd. (United Kingdom). . . . . [9451-31]

SESSION 9 . . . . TUE 4:40 PM TO 5:40 PM

ROIC and NUC

Session Chairs: **Paul L. McCarley,** Air Force Research Lab. (USA); **John T. Caulfield,** Cyan Systems (USA)

Digital pixel readout integrated circuit architectures for LWIR, Melik Yazici, Huseyin Kayahan, Omer Ceylan, Atia Shafique, Yasar Gurbuz, Sabanci Univ. (Turkey) . . . . [9451-32]

A 1280×1024-15 µm CTIA ROIC for SWIR FPAs, Selim Eminoglu, MikroSens Elektronik San ve Tic A S (Turkey) . . . . [9451-33]

Cryogenic measurements of a digital pixel readout integrated circuit for LWIR, Atia Shafique, Melik Yazici, Huseyin Kayahan, Omer Ceylan, Yasar Gurbuz, Sabanci Univ. (Turkey). . . . . [9451-34]

INTERACTIVE POSTER SESSION
TUESDAY EVENING.................... 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Design of IR omni-directional optical system for night vision and surveillance of defence and safety *(Invited Paper)*, Jae Heung Jo, Hannam Univ. (Korea, Republic of); Jae Myung Ryu, Kumoh National Institute of Technology (Korea, Republic of); Jong-goo Kang, Hannam Univ. (Korea, Republic of) .... [9451-7]

Study on magnetic circuit of moving magnet linear compressor, Xia Ming, Xiaoping Chen, Xiaoping Chen, Kunming Institute of Physics (China) . . [9451-91]

Polarization-selective uncooled infrared sensor using a one-dimensional plasmonic grating absorber, Shinpei Ogawa, Mitsubishi Electric Corp. (Japan); Yousuke Takagawa, Masafumi Kimata, Ritsumeikan Univ. (Japan) . . . . [9451-92]

Model, design, and fabrication of antenna coupled metal-insulator-metal diodes for IR sensing, Mesut Inac, Atia Shafique, Yasar Gurbuz, Meriç Özcan, Sabanci Univ. (Turkey)...................................... [9451-93]

Low-power LVDS for digital readout circuits, Melik Yazici, Huseyin Kayahan, Omer Ceylan, Atia Shafique, Yasar Gurbuz, Sabanci Univ. (Turkey) . . . [9451-94]

A study of doping influences on transmission of large-diameter gallium antimonide substrates for long-wave (LWIR) to very long wavelength (VLWIR) infrared applications, Rebecca J. Martinez, IQE IR (United Kingdom); Andrew Mowbray, Brian Smith, Marius Tybjerg, Wafer Technology Ltd. (United Kingdom); Mark J. Furlong, IQE IR (United Kingdom)............... [9451-95]

A 640×480-17 µm ROIC for uncooled microbolometer FPAs, Selim Eminoglu, MikroSens Elektronik San ve Tic A S (Turkey) .... [9451-96]

SiO_2 films mask processed by lift-off techniques for plasma etching of HgCdTe, Yiyu Chen, Univ. of Chinese Academy of Sciences (China); Zhenhua Ye, Shanghai Institute of Technical Physics (China)................ [9451-97]

Thermal stability of atomic layer deposition Al_2O_3 film on HgCdTe, P. Zhang, Shanghai Institute of Technical Physics (China); Changhong Sun, Y. Zhang, Shanghai Institute of Technical Physics (China); X. Chen, Shanghai Institute of Technical Physics (China); Y. Y. Chen, Zhenhua Ye, Shanghai Institute of Technical Physics (China) .... [9451-98]

Preliminary validation results of an ASIC for the readout and control of near-infrared large array detectors, Philip Påhlsson, Dirk X. Meier, Hans Kristian Otnes Berge, Petter Øya, David Steenari, Alf Olsen, Amir Hasanbegovic, Mehmet Akif Altan, Bahram Najafiuchevler, Jahanzad Talebi, Suleyman Azman, Codin Gheorghe, Jörg Ackermann, Gunnar Mæhlum, Integrated Detector Electronics AS (Norway) .... [9451-99]

POSTERS/ORAL STANDBYS .... TUE 6:00 PM TO 7:30 PM

Survivability of Corning durable silver-based multispectral mirrors, Leonard G. Wamboldt, Corning Incorporated (USA)...................... [9451-101]

Wednesday 22 April

Session 10 runs concurrently with session 13.

SESSION 10 .... WED 8:00 AM TO 11:20 AM

HOT: High Operating Temperature FPAs

Session Chairs: **Michael T. Eismann,** Air Force Research Lab. (USA); **Philip C. Klipstein,** SCD SemiConductor Devices (Israel)

Infrared SWAP detectors: pushing the limits, Yann Reibel, Laurent Rubaldo, Rachid Taalat, Alexandre Kerlain, Nicolas Péré-Laperne, Marie-Lise Bourqui, David Billon-Lanfrey, SOFRADIR (France); Gérard Destéfanis, Olivier Gravrand, Pierre Castelein, CEA-LETI (France) .... [9451-35]

Firefly: A HOT camera core for thermal imagers with enhanced functionality, Luke Pillans, Tim Edwards, Lee Richardson, David Jeckells, SELEX ES (United Kingdom)................................. [9451-36]

Fabrication of high-operating temperature (HOT), MWIR transparent photon-trap barrier-based detectors, Hasan Sharifi, Mark S. Roebuck, James Jenkins, Sevag Terterian, Pierre-Yves Delaunay, Terrence J. De Lyon, Daniel Yap, Sarabjit Mehta, Rajesh D. Rajavel, HRL Labs., LLC (USA)....... [9451-37]

High-operating temperature MWIR unipolar barrier photodetectors based on strained layer superlattices, David A. Ramirez, Stephen A. Myers, Elena Plis, SKINfrared LLC (USA); Sanjay Krishna, SKINfrared LLC (USA) and The Univ. of New Mexico (USA)................................. [9451-38]

Effects of AlSb interfaces on InAs/InAsSb type-II infrared superlattice material properties, Elizabeth H. Steenbergen, Air Force Research Lab. (USA); Zhiyuan Lin, Arizona State Univ. (USA); Said Elhamri, Univ. of Dayton (USA); Yong-Hang Zhang, Arizona State Univ. (USA); Ron Kaspi, Air Force Research Lab. (USA) .... [9451-39]

Progress on the development of interband cascade photodetectors *(Invited Paper)*, Zhao-Bing Tian, Sanjay Krishna, The Univ. of New Mexico (USA)....... [9451-40]

Numerical analysis of CdS/PbSe room temperature mid-infrared heterojunction photovoltaic detectors, Binbin Weng, Jijun Qiu, Lihua Zhao, Zhisheng Shi, The Univ. of Oklahoma (USA)..................... [9451-41]

Long-wave infrared HgCdTe unipolar PBνn photodetector, Weida Hu, Shanghai Institute of Technical Physics (China) .... [9451-42]

Lunch/Exhibition Break.........................Wed 11:20 am to 1:30 pm

SESSION 13..................... WED 8:00 AM TO 10:10 AM

Chalcogenide Glasses in IR Optical Design

Session Chairs: **Jasbinder S. Sanghera,** U.S. Naval Research Lab. (USA); **Christopher C. Alexay,** StingRay Optics, LLC (USA); **Jay N. Vizgaitis,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

Design and high-volume manufacture of low-cost molded IR aspheres for personal thermal imaging devices, Amy L. Zelazny, Kenneth F. Walsh, John P. Deegan, Brian Bundschuh, Edward K. Patton, Rochester Precision Optics, LLC (USA) .... [9451-54]

Design and fabrication of multispectral optics using expanded glass map, Shyam S. Bayya, Daniel J. Gibson, Vinh Q. Nguyen, Jasbinder S. Sanghera, U.S. Naval Research Lab. (USA); Mikhail Kotov, Sotera Defense Solutions, Inc. (USA); Gryphon Drake, Univ. Research Foundation (USA); John P. Deegan, George P. Lindberg, Rochester Precision Optics, LLC (USA) .... [9451-55]

Investigation of As40Se60 chalcogenide glass in precision glass molding for high-volume thermal imaging lenses, Alan Symmons, Raymond J. Pini, William V. Moreshead, Jacklyn Novak, LightPath Technologies, Inc. (USA) .... [9451-56]

GRIN optics for multispectral infrared imaging *(Invited Paper)*, Daniel J. Gibson, Shyam S. Bayya, Jasbinder S. Sanghera, Vinh Q. Nguyen, U.S. Naval Research Lab. (USA); Mikhail Kotov, Sotera Defense Solutions, Inc. (USA); Gryphon Drake, Univ. Research Foundation (USA) .... [9451-57]

Index change of chalcogenide materials from precision glass molding processes, John P. Deegan, George P. Lindberg, Robert Benson, Rochester Precision Optics, LLC (USA); Daniel J. Gibson, Shyam S. Bayya, Jasbinder S. Sanghera, U.S. Naval Research Lab. (USA) .... [9451-58]

Methods of both destructive and non-destructive metrology of GRIN optical elements, George P. Lindberg, John P. Deegan, Robert Benson, Rochester Precision Optics, LLC (USA); Daniel J. Gibson, Shyam S. Bayya, Jasbinder S. Sanghera, Vinh Q. Nguyen, U.S. Naval Research Lab. (USA); Mikhail Kotov, Sotera Defense Solutions, Inc. (USA) .... [9451-59]

Sessions 11 and 12 run concurrently with sessions 14, 15, and 16.

SESSION 11 . . . . WED 1:30 PM TO 4:20 PM

Uncooled FPAs and Applications I

Session Chairs: **Masafumi Kimata,** Ritsumeikan Univ. (Japan); **Stefan T. Baur,** Raytheon Vision Systems (USA)

Uncooled infrared focal plane array imaging in China *(Invited Paper)*, Shuyu Lei, Hui Fang, North GuangWei Technology Inc. (China) . . . . [9451-43]

Uncooled infrared detector and imager development at DALI technology, Lijun Jiang, Zhejiang Dali Technology Co., Ltd. (China) . . . . [9451-44]

BAE Systems' SMART Chip Camera FPA development *(Invited Paper)*, Louise C. Sengupta, Pierre-Alain Auroux, Donald D. McManus, D. Ahmasi Harris, Richard J. Blackwell, Jeffrey F. Bryant, Evan Binkerd, Mihir Boal, BAE Systems (USA) . . . . [9451-45]

Advanced uncooled sensor product development *(Invited Paper)*, Adam M. Kennedy, Paolo Masini, Mark J. Lamb, Jeff Hamers, Thomas A. Kocian, Eli E. Gordon, Raytheon Co. (USA); William J. Parrish, Ross E. Williams, Seek Thermal, Inc. (USA) . . . . [9451-46]

On-orbit performance of the compact infrared camera (CIRC) with uncooled infrared detector, Haruyoshi Katayama, Michito Sakai, Eri Kato, Yasuhiro Nakajima, Toshiyoshi Kimura, Japan Aerospace Exploration Agency (Japan); Koji Nakau, Hokkaido Univ. (Japan) . . . . [9451-47]

Low-SWaP shutterless uncooled video core by SCD, Udi Mizrahi, Yair Lury, Yaakov Gridish, Shahar Yuval, Nickolay Syrel, Yaron Shamay, Roman Meshorer, Roman Iosevich, Shibolet L. Horesh, SCD SemiConductor Devices (Israel) . . . . [9451-48]

SESSION 12 . . . . WED 4:20 PM TO 6:00 PM

Uncooled FPAs and Applications II

Session Chairs: **Colin E. Reese,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Kevin C. Liddiard,** Electro-optic Sensor Design (Australia); **Charles M. Hanson,** SenseIR Solutions, LLC (USA)

Improving the shutterless compensation method for TEC-less microbolometer-based infrared cameras, Alexander Tempelhahn, Helmut Budzier, Volker Krause, Gerald Gerlach, Technische Univ. Dresden (Germany) . . . . [9451-49]

Implementation and performance of shutterless uncooled micro-bolometer cameras, Jo Das, Danny De Gaspari, Philippe Cornet, Pieter D. Deroo, Jan P. Vermeiren, Xenics NV (Belgium); Patrick J. Merken, Xenics NV (Belgium) and Royal Military Academy (Belgium). . . . . [9451-50]

Shutters with embedded processors, Stanley W. Stephenson, Melles Griot (USA) . . . . [9451-51]

Integration of a patterned gold-black absorber with a VO_x-based bolometer for enhanced device performance, Evan M. Smith, Univ. of Central Florida (USA) and Plasmonics, Inc. (USA); Deep Panjwani, Univ. of Central Florida (USA); James C. Ginn III, Christopher J. Long, Plasmonics, Inc. (USA); Robert E. Peale, Univ. of Central Florida (USA); David J. Shelton, Joshua D. Perlstein, Plasmonics, Inc. (USA); Christian W. Smith, Univ. of Central Florida (USA) . . . . [9451-52]

Three-dimensional plasmonic metamaterial absorbers based on all metal structures, Shinpei Ogawa, Daisuke Fujisawa, Mitsubishi Electric Corp. (Japan); Masafumi Kimata, Ritsumeikan Univ. (Japan). [9451-53]

SESSION 14 . . . . WED 10:40 AM TO 12:10 PM

Alternative Approaches and Tools in IR Optical Design I

Session Chairs: **Jay N. Vizgaitis,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Christopher C. Alexay,** StingRay Optics, LLC (USA); **Jasbinder S. Sanghera,** U.S. Naval Research Lab. (USA)

> *This poster may also be given as an oral presentation in this session*
> **Survivability of Corning durable silver-based multispectral mirrors,** Leonard G. Wamboldt, Corning Incorporated (USA) . . . . [9451-101]

Diffractive optics technologies in infrared systems *(Invited Paper)*, Yakov G. Soskind, DHPC Technologies (USA) . . . . [9451-60]

Varo-Achro-Phobia: the fear of broad spectrum zoom optics, Christopher C. Alexay, Troy A. Palmer, StingRay Optics, LLC (USA) . . . [9451-61]

Improved optical-to-mechanical software export process for precision systems, Ian B. Murray, Jerry Ma, BAE Systems (USA). . . . . [9451-62]

Cost-effective lightweight mirrors for aerospace and defense, Kenneth S. Woodard, Lovell E. Comstock, Leonard G. Wamboldt, Joseph C. Crifasi, Brian P. Roy, Corning Incorporated (USA) . . . . [9451-63]

Lunch/Exhibition Break . . . . .Wed 12:10 pm to 1:30 pm

SESSION 15 . . . . WED 1:30 PM TO 2:10 PM

Alternative Approaches and Tools in IR Optical Design II

Session Chairs: **Jay N. Vizgaitis,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Christopher C. Alexay,** StingRay Optics, LLC (USA); **Jasbinder S. Sanghera,** U.S. Naval Research Lab. (USA)

An ultra-low surface finish process for 6061-Al mirrors, Leonard G. Wamboldt, Corning Incorporated (USA) . . . . [9451-64]

TBD *(Invited Paper)*, ... [9451-65]

SESSION 16 . . . . .WED 2:10 PM TO 4:40 PM

Cryogenic Detector Coolers

Session Chairs: **Richard M. Rawlings,** DRS Technologies, Inc. (USA); **Sergey V. Riabzev,** RICOR-Cryogenic & Vacuum Systems (Israel); **Ingo N. Ruehlich,** AIM INFRAROT-MODULE GmbH (Germany); **Alexander Veprik,** SCD SemiConductor Devices (Israel)

Miniature cryocooler developments for high-operating temperatures at Thales Cryogenics, Roel Arts, Thales Cryogenics B.V. (Netherlands); Jean-Yves Martin, Sebastien Van Acker, Thales Cryogénie S.A. (France); Daniel Willems, Jeroen C. Mullié, Frank Bots, Mark Tops, Thales Cryogenics B.V. (Netherlands); Julien Le Bordays, Thierry Etchanchu, Thales Cryogénie S.A. (France); Tonny Benschop, Thales Cryogenics B.V. (Netherlands). . . . . [9451-66]

Development and optimization progress with Ricor's cryocoolers for HOT IR detectors, Sergey V. Riabzev, RICOR-Cryogenic & Vacuum Systems (Israel) . . . . [9451-67]

Miniature linear cryocoolers for HOT applications, Ingo N. Ruehlich, Markus Mai, Carsten Rosenhagen, Andreas Withopf, Sebastian Zehner, AIM INFRAROT-MODULE GmbH (Germany) . . . . [9451-68]

Multi slope warm-up calorimetry of integrated Dewar-detector assemblies, Alexander Veprik, Baruch Shlomovich, SCD SemiConductor Devices (Israel); Avi Tuito, Israel Ministry of Defense (Israel) . . . . [9451-69]

Microsat cryocooler system, Carl S. Kirkconnell, Lauren S. Shaw, Jacinto Dominguez, Michael J. Ellis, Iris Technology Corp. (USA) . . . . [9451-70]

Advanced Ricor's cryocoolers for high-end IR missile warning systems and ruggedized platforms, Sergey V. Riabzev, RICOR-Cryogenic & Vacuum Systems (Israel) . . . . [9451-71]

CONFERENCE 9451

Thursday 23 April

SESSION 17. . . . . .THU 8:00 AM TO 10:30 AM

HgCdTe

Session Chairs: **Whitney Mason,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Michel Vuillermet,** SOFRADIR (France)

RMS noise modeling and detection for high-reliability HgCdTe infrared focal plane arrays development, Augustin Cathignol, Guillaume Vauquelin, Alexandre Brunner, Vincent Destefanis, SOFRADIR (France). . . . . [9451-72]

MCT by MBE on GaAs at AIM: state of the art and roadmap, Heinrich Figgemeier, Jan Wenisch, Detlef Eich, Stefan Hanna, Wilhelm Schirmacher, Holger Lutz, Timo Schallenberg, Rainer Breiter, AIM INFRAROT-MODULE GmbH (Germany). . . . . [9451-73]

Dark current characterization of very long-wavelength HgCdTe photodetectors, Weida Hu, Shanghai Institute of Technical Physics (China) . . . . [9451-74]

Improved MCT LWIR modules for demanding imaging applications, Rainer Breiter, Heinrich Figgemeier, Holger Lutz, Joachim C. Wendler, Stefan Rutzinger, Timo Schallenberg, AIM INFRAROT-MODULE GmbH (Germany) . . . . [9451-75]

Stress effects on electrical transportation properties of HgCdTe film, Pengyun Song, Xing Chen, Shan Zhang, Shanghai Institute of Technical Physics (China); Zhenhua Ye, Shanghai Institute of Technical Physics (China); Xiaoning Hu, Shanghai Institute of Technical Physics (China) . . . . [9451-76]

Low-dark current p-on-n MCT detector in long and very long-wavelength infrared, Cyril Cervera, Nicolas Baier, Olivier Gravrand, Olivier Boulade, Laurent Mollard, Commissariat à l'Énergie Atomique (France); Gérard Destéfanis, CEA-LETI (France); Vincent Moreau, Jean-Paul Zanatta, Commissariat à l'Énergie Atomique (France) . . . . [9451-77]

TBD *(Invited Paper)*, ... [9451-78]

SESSION 18 . . . . THU 11:00 AM TO 12:00 PM

A Word from the Masters

Session Chair: **Paul R. Norton,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

An IR journey *(Invited Paper)*, Michael A Kinch, DRS Sensors & Targeting Systems, Inc. (USA). . . . . [9451-79]

An IR castle *(Invited Paper)*, Gérard Destéfanis, CEA-LETI (France) . . . [9451-80]

Lunch/Exhibition Break . . . . Thu 12:00 pm to 1:30 pm

SESSION 19 . . . . THU 1:30 PM TO 2:40 PM

Reducing the Pitch

Session Chair: **Ronald G. Driggers,** St. Johns Optical Systems (USA)

Reducing pixel geometries with MOVPE grown MCT arrays, R. Kennedy McEwen, David Jeckells, Sudesh K. Bains, Selex ES (United Kingdom) [9451-81]

Update on 10 µm pixel pitch MCT-based focal plane array with enhanced functionalities, Yann Reibel, Thibault Augey, Laurent Baud, Nicolas Péré-Laperne, Julien Roumegoux, Laurent Rubaldo, Olivier Pacaud, SOFRADIR (France) . . . . [9451-82]

Small pixel oversampled focal plane arrays *(Invited Paper)*, John T. Caulfield, Jerry A. Wilson, Cyan Systems (USA); Nibir K. Dhar, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9451-83]

SESSION 20 . . . . .THU 2:40 PM TO 4:40 PM

Smart Processing

Session Chairs: **Paul L. McCarley,** Air Force Research Lab. (USA); **John T. Caulfield,** Cyan Systems (USA)

Hardware acceleration of lucky-region fusion (LRF) algorithm for high-performance real-time video processing, Tyler Browning, Christopher R. Jackson, Furkan Cayci, Univ. of Delaware (USA); Gary W. Carhart, Jony J. Liu, U.S. Army Research Lab. (USA); Fouad E. Kiamilev, Univ. of Delaware (USA) . . . . [9451-84]

Demonstrations of compressive pixel-based on-chip coded aperture temporal imaging of multiple and dynamic unresolved targets *(Invited Paper)*, Christy Fernandez-Cull, Brian M. Tyrrell, Joseph H. Lin, Richard D'Onofrio, MIT Lincoln Lab. (USA) . . . . [9451-85]

An edge-enhanced infrared-visible image fusion method based on NSCT and fuzzy logic, Qiong Zhang, Xavier Maldague, Univ. Laval (Canada) [9451-86]

TBD, ... [9451-87]

SESSION 21 . . . . .THU 4:40 PM TO 5:40 PM

Alternative Photon Detectors and Applications

Session Chair: **Henk Martijn,** IRnova AB (Sweden)

Resonator-QWIP FPA development, Kwong-Kit Choi, Jason N. Sun, Kimberley A. Olver, U.S. Army Research Lab. (USA) . . . . [9451-88]

Thermal infrared sensors at the Jet Propulsion Laboratory: hyperspectral and multispectral remote sensing, William R. Johnson, Simon J. Hook, Jet Propulsion Lab. (USA) . . . . [9451-89]

Theoretical study of QWIP or QDIP IR-FPA non-uniformity correction, Yusuke Matsukura, Fujitsu Labs., Ltd. (Japan) . . . . [9451-90]

CONFERENCE ENDS . . . . 5:40 PM TO 5:40 PM

CONFERENCE 9452

Tuesday–Thursday 21–23 April 2015 • Proceedings of SPIE Vol. 9452

Infrared Imaging Systems: Design, Analysis, Modeling, and Testing XXVI

Conference Chairs: **Gerald C. Holst,** JCD Publishing (USA); **Keith A. Krapels,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

Program Committee: **Gary H. Ballard,** U.S. Army Research, Development and Engineering Command (USA); **Gisele Bennett,** Georgia Institute of Technology (USA); **Piet Bijl,** TNO Defence, Security and Safety (Netherlands); **James A. Buford Jr.,** U.S. Army Research, Development and Engineering Command (USA); **James A. Dawson,** Dynetics, Inc. (USA); **Ronald G. Driggers,** St. Johns Optical Systems (USA); **Richard L. Espinola,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **David P. Forrai,** L-3 Communications Cincinnati Electronics (USA); **Jonathan G. Hixson,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Alan Irwin,** Santa Barbara Infrared, Inc. (USA); **Eddie L. Jacobs,** Univ. of Memphis (USA); **Terrence S. Lomheim,** The Aerospace Corp. (USA); **R. Lee Murrer Jr.,** Millennium Engineering and Integration Co. (USA); **Teresa L. Pace,** SenTech, LLC- A DSCI Co. (USA); **Hector M. Reyes,** Raytheon Co. (USA); **Endre Repasi,** Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany); **Joseph P. Reynolds,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Bernard M. Rosier,** ONERA (France); **Michael A. Soel,** FLIR Systems, Inc. (USA); **Curtis M. Webb,** Northrop Grumman Electronic Systems (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 8:30 AM TO 11:50 AM

Testing and Systems

Session Chairs: **Alan Irwin,** Santa Barbara Infrared, Inc. (USA); **Curtis M. Webb,** Northrop Grumman Electronic Systems (USA)

Black-box imager characterization, from measurements to modeling range performance *(Invited Paper)*, David P. Haefner, Stephen D. Burks, Brian P. Teaney, U.S. Army RDECOM CERDEC NVESD (USA) . . . . [9452-1]

Characterizing a high-resolution CRT display performance using a Prichard photometer with microscanner, Balvinder Kaur, Jeff T. Olson, Jonathan G. Hixson, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . [9452-2]

Validating machine vision MRT performance against trained observer performance for linear shift invariant sensors, Stephen D. Burks, Joshua M. Doe, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . [9452-3]

Advanced E-O test capability for Army Next-Generation Automated Test System (NGATS), Fred King, Steve W. McHugh, Steve Errea, James McKechnie, Brian Nehring, Gregory P. Matis, Santa Barbara Infrared, Inc. (USA) . . . . [9452-4]

Signal intensity transfer function determination on thermal systems with stray light and scattering present, Stephen D. Burks, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9452-5]

Measuring noise equivalent irradiance of a digital short-wave infrared imaging system using a broadband source to simulate the night spectrum, Tim Robinson, John Green, Esterline Control & Communication Systems (USA) . . . . [9452-6]

Statistical analysis of target acquisition sensor modeling experiments, Dawne M. Deaver, Steven K. Moyer, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9452-7]

Panoramic sensor requirements for military vehicles, Orges Furxhi, Ronald G. Driggers, St. Johns Optical Systems (USA); Bradley L. Preece, Keith A. Krapels, U.S. Army Night Vision & Electronic Sensors Directorate (USA) [9452-8]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:00 pm

SESSION 2 . . . . TUE 1:00 PM TO 3:00 PM

Targets, Backgrounds and Atmospherics

Session Chairs: **Richard L. Espinola,** U.S. Army RDECOM CERDEC NVESD (USA); **Endre Repasi,** Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany); **Bernard M. Rosier,** ONERA (France)

Simulation of a polarized laser beam reflected at the sea surface: modeling and validation, Frédéric Schwenger, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany) . . . . [9452-9]

Detector integration time-dependent atmospheric turbulence imaging simulation, Todd W. Du Bosq, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Endre Repasi, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany). . . . . [9452-10]

Image enhancement methods for turbulence mitigation and the influence of different color spaces, Claudia S. Huebner, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany) . . . . [9452-11]

Automatic parameter estimation for atmospheric turbulence mitigation techniques, Stephen Kozacik, Aaron L. Paolini, Eric J. Kelmelis, EM Photonics, Inc. (USA). . . . . [9452-12]

Atmospheric turbulence and sensor system effects on biometric algorithm performance, Richard L. Espinola, Kevin R. Leonard, U.S. Army RDECOM CERDEC NVESD (USA); Kenneth A. Byrd, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Guy Potvin, Defence Research and Development Canada, Valcartier (Canada) . . . . [9452-13]

An adaptive tracker for ShipIR/NTCS, Srinivasan Ramaswamy, David A. Vaitekunas, W. R. Davis Engineering, Ltd. (Canada). . . . . [9452-14]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. . . . . TUE 6:00 PM TO 12:00 AM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

New night vision goggle gain definition, Vyacheslav B. Podobedov, George P. Eppeldauer, Thomas C. Larason, National Institute of Standards and Technology (USA) . . . . [9452-38]

Application and validation of a S/W developed for IR signal simulation by using the measured data from a moving test ship, Kuk-Il Han, Dong-Geon Kim, Jun-Hyuk Choi, Tae-Kuk Kim, Chung-Ang Univ. (Korea, Republic of) . . . . [9452-39]

Contrast performance modeling of broadband IR imaging systems with tunable filter fore-optics, Van A. Hodgkin, U.S. Army RDECOM CERDEC NVESD (USA). . . . . [9452-40]

A real-time contrast enhancement using adaptive histogram threshold for a FLIR camera, Sunmi Oh, Samsung Digital City (Korea, Republic of); Gyu-Hee Park, SK Telecom (Korea, Republic of) . . . . [9452-41]

Optical design of an LWIR imaging polarimetric camera, Sławomir Gogler, Military Univ. of Technology (Poland) . . . . [9452-42]

DEFENSE + SECURITY

CONFERENCE 9452

Wednesday 22 April

SESSION 3 . . . . WED 8:10 AM TO 10:00 AM

Modeling I

Session Chairs: **Keith A. Krapels,** U.S. Army RDECOM CERDEC NVESD (USA); **Gisele Bennett,** Georgia Institute of Technology (USA); **Piet Bijl,** TNO Defence, Security and Safety (Netherlands); **James A. Dawson,** Dynetics, Inc. (USA); **Jonathan G. Hixson,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

Simulation-based sensor modeling and at-range target detection characterization *(Invited Paper)*, Corey D. Packard, Peter L. Rynes, Allen R. Curran, ThermoAnalytics, Inc. (USA) . . . . [9452-15]

Probability of detection using ShipIR/NVIPM, David A. Vaitekunas, W. R. Davis Engineering, Ltd. (Canada); Gerald C. Holst, JCD Publishing (USA); Srinivasan Ramaswamy, W. R. Davis Engineering, Ltd. (Canada) . . . . . [9452-16]

A TRM4 component for the night vision integrated performance model, Joseph P. Reynolds, Brian P. Teaney, U.S. Army RDECOM CERDEC NVESD (USA); Todd W. Du Bosq, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Endre Repasi, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany). . . . . [9452-17]

A low-light performance survey of commercially available camera modules, Bradley L. Preece, David M. Tomkinson, Joseph P. Reynolds, U.S. Army RDECOM CERDEC NVESD (USA) . . . . [9452-18]

Depth of field in modern thermal imaging, Norbert Schuster, John W. Franks, Umicore Electro-Optic Materials (Belgium). . . . . [9452-19]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 4 . . . . .WED 1:00 PM TO 2:30 PM

Modeling II

Session Chairs: **Ronald G. Driggers,** St. Johns Optical Systems (USA); **David P. Forrai,** L-3 Communications Cincinnati Electronics (USA); **Eddie L. Jacobs,** The Univ. of Memphis (USA); **Terrence S. Lomheim,** The Aerospace Corp. (USA)

Optimum viewing distance *(Invited Paper)*, Gerald C. Holst, JCD Publishing (USA) . . . . [9452-20]

Optimal design of a compressive sensing imaging system, Bradley L. Preece, U.S. Army RDECOM CERDEC NVESD (USA); Todd W. Du Bosq, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Nader M. Namazi, Georges T. Nehmetallah, The Catholic Univ. of America (USA) . . . . [9452-21]

Block randomization versus complete randomization of human perception stimuli: Is there a difference?, Steven K. Moyer, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Elizabeth R. Uhl, U. S. Army Research Institute (USA) . . . . [9452-22]

Modeled performance of low-light digital imagers, Joseph P. Reynolds, Bradley L. Preece, U.S. Army RDECOM CERDEC NVESD (USA) . . . . . [9452-23]

SESSION 5 . . . . WED 2:30 PM TO 5:00 PM

Modeling III

Session Chairs: **Teresa L. Pace,** DSCI (USA); **Hector M. Reyes,** Raytheon Co. (USA); **Joseph P. Reynolds,** U.S. Army RDECOM CERDEC NVESD (USA); **Michael A. Soel,** FLIR Systems, Inc. (USA)

Legacy modeling and range prediction comparison: NV-IPM versus SSCamIP and NVTherm, Jonathan G. Hixson, Philip I. Richardson, Balvinder Kaur, David M. Tomkinson, Brian P. Teaney, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9452-24]

Custom component generation in the night vision integrated performance model, Brian P. Teaney, David P. Haefner, U.S. Army RDECOM CERDEC NVESD (USA); Stephen D. Burks, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9452-25]

Investigating the validity of the networked imaging sensor model in field of view search, Melvin H. Friedman, U.S. Army RDECOM CERDEC NVESD (USA); Eric A. Flug, Steven K. Moyer, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9452-26]

Model of Large-format EO-IR sensor for calculating the probability of detection and false alarm for fixed and moving targets, Andrew R. Korb, Korb Satellite Systems (USA) . . . . [9452-27]

Face acquisition camera design using the NV-IPM image generation tool, Kenneth A. Byrd, Joseph P. Reynolds, U.S. Army Night Vision & Electronic Sensors Directorate (USA). . . . . [9452-28]

Detection range estimation model for LWIR polarmetric camera, Sławomir Gogler, Military Univ. of Technology (Poland) . . . . [9452-29]

Thursday 23 April

SESSION 6 . . . . THU 9:00 AM TO 12:10 PM

HWIL

Session Chairs: **James A. Buford Jr.,** U.S. Army Research, Development and Engineering Command (USA); **R. Lee Murrer Jr.,** Millennium Engineering and Integration Co. (USA); **Gary H. Ballard,** U.S. Army Research, Development and Engineering Command (USA)

Scene projection technology enhancements for testing infrared imaging sensors in a simulated environment, Heard S. Lowry, Aerospace Testing Alliance (USA) . . . . [9452-30]

Development of an ultrahigh-temperature infrared scene projector at Santa Barbara Infrared Inc., Gregory Franks, Joseph D. Laveigne, Tom Danielson, Santa Barbara Infrared, Inc. (USA); John M. Lannon Jr., Scott H. Goodwin, RTI International (USA); Kevin Sparkman, Santa Barbara Infrared, Inc. (USA) . . . . [9452-31]

Test pixels for high-temperature infrared scene projection, Christopher J. Fredricksen, LRC Engineering, Inc. (USA); Seth Calhoun, Stephen Trewick, Aubrey Coffey, Edward Dein, Kevin R. Coffey, Robert E. Peale, Univ. of Central Florida (USA); Joseph D. LaVeigne, Gregory Franks, Tom Danielson, Santa Barbara Infrared, Inc. (USA); John M. Lannon Jr., Scott H. Goodwin, RTI International (USA). . . . . [9452-32]

Resolution specification for infrared scene projectors used in hardware-in-the-loop testing, Joseph D. LaVeigne, Gregory Franks, Tom Danielson, Santa Barbara Infrared, Inc. (USA); Breck A. Sieglinger, William L. Herald, MacAulay-Brown, Inc. (USA). . . . . [9452-33]

Spectral homogenization techniques for the hyperspectral image projector, Logan E. Hillberry, Colorado School of Mines (USA); Joseph P. Rice, National Institute of Standards and Technology (USA). [9452-34]

Advances in iterative non-uniformity correction techniques for infrared scene projection, Tom Danielson, Joseph D. LaVeigne, Gregory Franks, Marcus Prewarski, Brian Nehring, Santa Barbara Infrared, Inc. (USA) . . [9452-35]

Computing the total atmospheric refraction for real-time optical imaging sensor simulation, Richard F. Olson Jr., U.S. Army Research, Development and Engineering Command (USA). . . . . [9452-36]

Memory efficient atmospheric effects modeling for infrared scene generators, Çaglar Kavak, Seçkin Özsaraç, TÜBİTAK BİLGEM İLTAREN (Turkey) . . . . [9452-37]

CONFERENCE 9453

Tuesday–Wednesday 21–22 April 2015 • Proceedings of SPIE Vol. 9453

Window and Dome Technologies and Materials XIV

Conference Chair: **Brian J. Zelinski,** Raytheon Missile Systems (USA)

Program Committee: **Rick Gentilman,** Raytheon Integrated Defense Systems (USA); **Daniel C. Harris,** Naval Air Warfare Ctr. Weapons Div. (USA); **Brian K. Jones,** U.S. Army Research, Development and Engineering Command (USA); **John S. McCloy,** Washington State Univ. (USA); **Richard Porter,** Air Force Research Lab. (USA); **Michael E. Thomas,** Johns Hopkins Univ. Applied Physics Lab. (USA); **Randal W. Tustison,** Consultant (USA); **Martin Winterling,** UTC Aerospace Systems (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 8:00 AM TO 10:00 AM

Advances in Mid-Wavelength Infrared Window Technology

Session Chair: **Richard Gentilman,** Raytheon Co. (USA)

SESSION 2 . . . . .TUE 10:30 AM TO 11:50 AM

Window and Dome Technology Overviews

Session Chair: **Brian J. Zelinski,** Raytheon Missile Systems (USA)

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . .TUE 1:20 PM TO 3:00 PM

Metrology and Finishing of Flat, Free-Form, and Conformal Optics

Session Chair: **Daniel C. Harris,** Naval Air Warfare Ctr. Weapons Div. (USA)

SESSION 4 . . . . TUE 3:30 PM TO 5:50 PM

Novel Processing and Applications of Optical Windows, Domes, and Coatings

Session Chair: **Michael E. Thomas,** Johns Hopkins Univ. (USA)

DEFENSE + SECURITY

Wednesday 22 April

SESSION 5 . . . . .WED 8:00 AM TO 10:00 AM

Computational Modeling of Optical and Mechanical Properties

Session Chair: **John S. McCloy,** Washington State Univ. (USA)

Electronic-band structures and optical properties of transition metal-doped zinc oxide, Esakkimuthuraju Murugan, Mahesh Rajendran, Badrinath Vadakkapattu Canthadai, Venugopal Reddy Paduru, Sreekanth Tirumala, Vidya Jyothi Institute of Technology (India). . . . . [9453-22]

Role of impactor properties on computational simulation of sand impact damage in transparent ceramic windows, Robert Schultz, The Univ. of Arizona (USA); Ibrahim Guven, Virginia Commonwealth Univ. (USA); Brian J. Zelinski, Raytheon Missile Systems (USA) . . . . [9453-23]

Computational modeling of sand impact damage in coated, transparent ceramic windows, Shanna Tune, Robert Schultz, The Univ. of Arizona (USA); Ibrahim Guven, Virginia Commonwealth Univ. (USA); Brian J. Zelinski, Raytheon Missile Systems (USA). . . . . [9453-24]

New ZnS interatomic potential for molecular dynamics simulations, Erin K. Boland, Raytheon Missile Systems (USA); Krishna Muralidharan, The Univ. of Arizona (USA); Brian J. Zelinski, Raytheon Missile Systems (USA); Stefan Bringuier, The Univ. of Arizona (USA) . . . . [9453-25]

Stress analysis of optical coatings for improved durability and performance of high-end optical components, Shay Joseph, Anna Gleizer, Doron Yadlovker, Arit E. Shinman-Avraham, Rafael Advanced Defense Systems Ltd. (Israel) . . . . [9453-26]

Internal two-phase cooling of an aerodynamically heated LWIR window, Brian Tucker, Joshua Sole, Mainstream Engineering (USA) . . . . [9453-27]

SEE PROFESSIONAL DEVELOPMENT COURSES
pages 145–214

CONFERENCE 9454

Monday–Thursday 20–23 April 2015 • Proceedings of SPIE Vol. 9454

Detection and Sensing of Mines, Explosive Objects, and Obscured Targets XX

Conference Chairs: **Steven S. Bishop,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Jason C. Isaacs,** Naval Surface Warfare Ctr. Panama City Div. (USA)

Program Committee: **Benjamin E. Barrowes,** U.S. Army Engineer Research and Development Ctr. (USA); **Ryan R. Close,** U.S. Army Night Vision & Electronics Sensors Directorate (USA); **Leslie M. Collins,** Duke Univ. (USA); **Gerald J. Dobeck,** Naval Surface Warfare Ctr. Panama City Div. (USA); **Anthony A. Faust,** Defence Research and Development Canada, Suffield (Canada); **Tesfaye G-Michael,** Naval Surface Warfare Ctr. Panama City Div. (USA); **Gregory Garcia,** Naval Surface Warfare Ctr. Panama City Div. (USA); **James M. Keller,** Univ. of Missouri-Columbia (USA); **Aaron LaPointe,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Henric Östmark,** Swedish Defence Research Agency (Sweden); **Motoyuki Sato,** Tohoku Univ. (Japan); **Waymond R. Scott Jr.,** Georgia Institute of Technology (USA); **Richard C. Weaver,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

Monday 20 April

SESSION 1. . . . . MON 8:30 AM TO 9:50 AM

Technology Mélange I

Session Chairs: **Denis M. Reidy,** Naval Explosive Ordnance Disposal Technology Div. (USA); **Leslie M. Collins,** Duke Univ. (USA)

Forecasting the soil-dependent performance of ground-penetrating radar by means of a conventional field moisture sensor, Markus Loewer, Jan Igel, Leibniz Institute for Applied Geosciences (Germany) . . . . [9454-1]

Stand-off explosive detection utilizing low-power stimulated emission nuclear quadrupole resonance detection and sub-wavelength focusing wideband super lens, William Mouyos, John Apostolos, Judy Feng, Walter Chase, AMI Research and Development (USA) . . . . [9454-2]

Minimally disruptive schedule repair for MCM Missions, Kalyan M. Gupta, Matthew Molineaux, Bryan L. Auslander, Philip G. Moore, Knexus Research (USA) . . . . [9454-3]

Fusion of iECO image descriptors for buried explosive hazard detection in forward-looking imagery, Stanton R. Price, Derek T. Anderson, Mississippi State Univ. (USA); James M. Keller, Univ. of Missouri-Columbia (USA) . . [9454-4]

SESSION 2 . . . . MON 10:40 AM TO 12:00 PM

Technology Mélange II

Session Chairs: **Zeke Topolosky,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Joe Keranen,** White River Technologies, Inc. (USA)

Detection of concealed targets using spintronic microwave sensor, Lei Fu, Yongsheng Gui, Can-Ming Hu, Univ. of Manitoba (Canada); Yang Xiao, Mounir Jaidann, Hong Guo, McGill Univ. (Canada); Hakima Abou-Rachid, Defence Research and Development Canada, Valcartier (Canada) . . . . [9454-5]

Differential excitation spectroscopy for detection of common explosives: ammonium nitrate and urea nitrate, Boyd V. Hunter, Jason M. Cox, Kestrel Corp. (USA); Michael A. Miller, Southwest Research Institute (USA); Richard V. Hunter, Paul Harrison, Levi Van Bastian, William P. Walters, Kestrel Corp. (USA) . . . . [9454-6]

Using a blackboard architecture or expert system to identify obfuscated targets from symptoms, Jeremy Straub, Univ. of North Dakota (USA) . [9454-7]

Efficiency of using the spectral dynamics analysis for pulsed THz spectroscopy of both explosive and other materials, Vyacheslav A. Trofimov, Svetlana A. Varentsova, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9454-8]

Lunch Break . . . . .Mon 12:00 pm to 1:30 pm

SESSION 3 . . . . MON 1:30 PM TO 3:10 PM

Electromagnetic Induction I

Session Chairs: **Rajiv Suri,** U.S. Army Research, Development and Engineering Command (USA); **Alina Zare,** Univ. of Missouri-Columbia (USA)

Fuzzy logic-based IED/landmine detection sensor evaluation methodology, Canicious G. Abeynayake, Defence Science and Technology Organisation (Australia). . . . . [9454-9]

Explosive hazard detection using sensor fusion and multiple kernel learning with downward-looking GPR and EMI sensor data, Anthony Pinar, Michigan Technological Univ. (USA); Matthew P. Masarik, Jack Kelly, Michigan Tech Research Institute (USA); Timothy C. Havens, Michigan Technological Univ. (USA); Joseph W. Burns, Brian T. Thelen, Michigan Tech Research Institute (USA); John Becker, Michigan Technological Univ. (USA) . . . . [9454-10]

Extended-range electromagnetic induction sensor concepts, Jonathan S. Miller, Chet Bassani, Gregory Schultz, White River Technologies, Inc. (USA). . . . . [9454-11]

Wideband electromagnetic interrogation of buried explosive hazards using 3D array, Gregory Schultz, Jonathan S. Miller, Chet Bassani, Peter Lorenz, Joe Keranen, White River Technologies, Inc. (USA) . . . . [9454-12]

Munitions detection and discrimination on-the-move: dynamic EMI classification methods and potential in CONUS and OCONUS applications, Gregory Schultz, Jonathan S. Miller, Joe Keranen, Fridon Shubitidze, White River Technologies, Inc. (USA) . . . . [9454-13]

SESSION 4 . . . . MON 3:40 PM TO 4:40 PM

Electromagnetic Induction II

Session Chairs: **Frank Navish III,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Gregory Schultz,** White River Technologies, Inc. (USA)

Non-colocated sensor fusion for buried explosive threat detection for handheld data, Mary Knox, Peter A. Torrione, Leslie M. Collins, Kenneth D. Morton Jr., Duke Univ. (USA) . . . . [9454-14]

Multiple instance dictionary learning for subsurface object detection using handheld EMI, Alina Zare, Univ. of Missouri-Columbia (USA); Brendan Alvey, Univ. of Missouri (USA) and Univ. of Missouri-Columbia (USA); Matthew Cook, Dominic K. Ho, Univ. of Missouri-Columbia (USA) . . . . [9454-15]

Phase response of high- to very high-frequency metal/anomaly detector, Daniel C. Heinz, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); Michael L. Brennan, CACI International Inc. (USA); Michael B. Steer, North Carolina State Univ. (USA); Adam W. Melber, John T. Cua, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA) [9454-16]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

CONFERENCE 9454

Tuesday 21 April

SESSION 5 . . . . TUE 8:20 AM TO 10:00 AM

EO/IR Technologies and Signal Processing I

Session Chairs: **Ryan R. Close,** U.S. Army RDECOM CERDEC NVESD (USA); **Kevin K. Green,** EOIR Technologies (USA)

A probabilistic framework for comparing multi-modality buried threat detection systems with dynamic velocity and sensor activity, Jordan M. Malof, Kenneth D. Morton Jr., Leslie M. Collins, Peter A. Torrione, Duke Univ. (USA) . . . . [9454-17]

Ground vehicle-based LADAR for standoff detection of road-side hazards, Jim Hollinger, Brett Kutscher, LSA Autonomy LLC (USA); Ryan R. Close, U.S. Army RDECOM CERDEC NVESD (USA) . . . . [9454-18]

Airborne thermal infrared hyperspectral imaging of buried objects, Marc-André Gagnon, Alexandrine Huot, Karl-Alexandre Jahjah, Pierre Tremblay, Simon Savary, Vincent Farley, Philippe Lagueux, Éric Guyot, Martin Chamberland, Telops (Canada) . . . . [9454-19]

Learning of an explosive hazard detection pre-screener in forward looking imagery based on adaptive mutation Ravinder Singh, Stanton R. Price, Derek T. Anderson, Mississippi State Univ. (USA) . . . . [9454-20]

Design of a buried explosive hazard pre-screener in forward looking imagery based on Shearlet filtering and image post-processing, Stanton R. Price, Derek T. Anderson, Mississippi State Univ. (USA); James M. Keller, Univ. of Missouri-Columbia (USA) . . . . [9454-21]

SESSION 6 . . . . TUE 10:30 AM TO 11:50 AM

EO/IR Technologies and Signal Processing II

Session Chairs: **Sanjeev Agrawal,** Malaviya National Institute of Technology (India); **Bruce Swett,** EOIR Technologies (USA)

Near real-time, on-the-move multisensor integration and computing framework, Kevin K. Green, Chris Burnette, Chris Geyer, EOIR Technologies (USA); Sanjeev Agarwal, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Diane E. Moulton, EOIR Technologies (USA); Chung D. Phan, U.S. Army RDECOM CERDEC NVESD (USA); Richard M. Lydic Jr., U.S. Army Night Vision & Electronic Sensors Directorate (USA); Bruce Swett, EOIR Technologies (USA) . . . . [9454-22]

Near real-time, on-the-move software PED using VPEF, Kevin K. Green, Chris Geyer, Chris Burnette, EOIR Technologies (USA); Sanjeev Agarwal, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Bruce Swett, EOIR Technologies (USA); Chung D. Phan, Richard M. Lydic Jr., U.S. Army Night Vision & Electronic Sensors Directorate (USA); Diane Deterline, EOIR Technologies (USA) . . . . [9454-23]

Automated on-the-move threat detection within the MOVERS+/VPEF framework, Mark P. Kolba, Joshua R. Walters, Signal Innovations Group, Inc. (USA) . . . . [9454-24]

Real-time buried IED detection and cueing capability in VPEF environment, Bo Ling, Migma Systems, Inc. (USA); Sanjeev Agarwal, U.S. Army RDECOM CERDEC NVESD (USA); Santiago Olivera, Zlatko Vasilkoski, Migma Systems, Inc. (USA); Chung D. Phan, Richard M. Lydic Jr., U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9454-25]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 7 . . . . TUE 1:20 PM TO 2:00 PM

EO/IR Technologies and Signal Processing III

Session Chairs: **Robert H. Luke III,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Mark P. Kolba,** Signal Innovations Group, Inc. (USA)

Multi-scale HOG prescreening algorithm for detection of buried explosive hazards in FL-IR imagery, Kevin E. Stone, James M. Keller, Univ. of Missouri-Columbia (USA) . . . . [9454-26]

An application of log-Gabor filter on road detection in arid environments for forward looking buried object detection, James M. Keller, Pooparat Plodpradista, Mihail Popescu, Univ. of Missouri-Columbia (USA) . . . . . [9454-27]

SESSION 8 . . . . TUE 2:00 PM TO 3:00 PM

Laser Based Chemical Sensing Technologies

Session Chairs: **Ken E. Yasuda,** U.S. Army RDECOM CERDEC NVESD (USA); **Mikella E. Farrell,** U.S. Army Research Lab. (USA)

A method for detecting ultra-low quantities of explosives with use a picosecond laser FAIMS analyzer, Gennadii Kotkovskii, Alexander A. Chistyakov, Ivan P. Odulo, Alexey V. Sychev, National Research Nuclear Univ. MEPhI (Russian Federation); Artem S. Bogdanov, Anatoly N. Perederiy, Moscow State Institute of Radiotechnics, Electronics and Automation (Russian Federation); Evgeny M. Spitsyn, JSC "Research Institute" POLYUS "them. M.F. Stelmaha" (Russian Federation); Alexander V. Shestakov, POLYUS Research and Development Institute (Russian Federation) . . . . [9454-28]

Surface enhanced Raman scattering (SERS) detection of ammonium nitrate (AN) samples fabricated using drop-on-demand inkjet technology, Mikella E. Farrell, Ellen L. Holthoff, Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . [9454-29]

Detection of homemade explosives using Raman excitation at 1064 nm, Eric G. Roy, Claire Dentinger, Claude Robotham, Rigaku Raman Technologies, Inc. (USA) . . . . [9454-30]

SESSION 9 . . . . TUE 3:30 PM TO 5:30 PM

Forward Looking GPR Technologies

Session Chairs: **Brian P. Burns,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Matthew P. Masarik,** Michigan Tech Research Institute (USA)

Clutter and target discrimination in forward-looking ground penetrating radar using sparse structured basis pursuits, Joseph A. Camilo, Jordan M. Malof, Peter A. Torrione, Leslie M. Collins, Kenneth D. Morton Jr., Duke Univ. (USA) . . . . [9454-31]

Deep belief networks for false alarm rejection in forward-looking ground-penetrating radar, John Becker, Timothy C. Havens, Anthony Pinar, Timothy J. Schulz, Michigan Technological Univ. (USA) . . . . [9454-32]

Video processing for explosive hazard detection with forward-looking GPR, Adam Webb, Michigan Tech Research Institute (USA) and Michigan Technological Univ. (USA); Timothy C. Havens, Timothy J. Schulz, Michigan Technological Univ. (USA) . . . . [9454-33]

A synthetic aperture acoustic prototype system, Robert H. Luke III, Steven S. Bishop, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Aaron Chan, U.S. Army RDECOM CERDEC NVESD (USA); Peter M. Gugino, Thomas P. Donzelli, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Mehrdad Soumekh, Soumekh Consultant (USA) . . . . [9454-34]

Explosive hazard detection using MIMO forward-looking ground-penetrating radar, Darren Shaw, Univ. of Missouri (USA); Dominic K. Ho, James M. Keller, Mihail Popescu, Univ. of Missouri-Columbia (USA); Robert H. Luke III, Brian P. Burns, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9454-35]

Advanced processing of standoff sensor data for detecting explosively formed penetrators, Joe Keranen, Gregory Schultz, Fridon Shubitidze, White River Technologies, Inc. (USA); Kancham Chotoo, User Systems, Inc. (USA) . . . . [9454-36]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Fractal descriptors for buried explosive hazard detection in forward looking imagery, Joshua L. Dowdy, Mississippi State Univ. (USA). . . . [9454-61]

Wednesday 22 April

SESSION 10 . . . . WED 8:20 AM TO 10:00 AM

GPR Technologies I

Session Chairs: **Brian C. Barlow,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Peter A. Torrione,** Duke Univ. (USA)

Automatic target detection and discrimination algorithms applicable to ground penetrating radar array data, Canicious G. Abeynayake, Defence Science and Technology Organisation (Australia); Minh D. Tran, Univ. of South Australia (Australia) . . . . [9454-37]

Design and validation of inert homemade explosive simulants for ground penetrating radar, Anthony A. Faust, Brian VanderGaast, Defence Research and Development Canada, Suffield (Canada); John E. McFee, McFysics Consulting (Canada); Cristian Mosquera, Defence Research and Development Canada, Suffield (Canada). . . . . [9454-38]

Deep convolutional neural networks for classifying GPR B-scans, Lance E. Besaw, Phil J. Stimac, Applied Research Associates, Inc. (USA). . . . . . [9454-39]

GPR anomaly detection with robust principal component analysis, Matthew P. Masarik, Joseph W. Burns, Brian T. Thelen, Jack Kelly, Michigan Tech Research Institute (USA); Timothy C. Havens, Michigan Technological Univ. (USA) . . . . [9454-40]

A layer tracking approach to buried surface detection, Peter J. Dobbins, Joseph Wilson, Brandon Smock, Univ. of Florida (USA) . . . . [9454-41]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 11. . . . . WED 1:00 PM TO 2:40 PM

GPR Technologies II

Session Chairs: **Pete Howard,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Matthew P. Masarik,** Michigan Tech Research Institute (USA)

Target signature localization in GPR data by clustering and classification, Daniel Reichman, Kenneth D. Morton Jr., Leslie M. Collins, Peter A. Torrione, Duke Univ. (USA). . . . . [9454-42]

Fast 3D subsurface imaging with stepped-frequency GPR, Matthew P. Masarik, Joseph W. Burns, Brian T. Thelen, Lena Sutter, Michigan Tech Research Institute (USA) . . . . [9454-43]

Fusion of forward-looking infrared camera and down-looking ground penetrating radar for buried target detection, Firat Gurbuz, IPA DEFENCE Ltd. (Turkey) and Hacettepe Univ. (Turkey); Seniha E. Yuksel, Hacettepe Univ. (Turkey); Gozde Bozdagi Akar, Middle East Technical Univ. (Turkey) . . [9454-44]

Detection of deeply buried non-metal objects by ground-penetrating radar using non-negative matrix factorization, Daniel Nabelek, Dominic K. Ho, Univ. of Missouri-Columbia (USA) . . . . [9454-45]

Recognizing subsurface target responses in ground penetrating radar data using convolutional neural networks, Rayn T. Sakaguchi, Kenneth D. Morton Jr., Leslie M. Collins, Peter A. Torrione, Duke Univ. (USA) . . . . [9454-46]

SESSION 12 . . . . WED 3:30 PM TO 4:30 PM

GPR Technologies III

Session Chairs: **Richard C. Weaver,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Lance E. Besaw,** Applied Research Associates, Inc. (USA)

Improving buried threat detection in ground-penetrating radar with transfer learning and metadata analysis, Kenneth A. Colwell, Peter A. Torrione, Leslie M. Collins, Kenneth D. Morton Jr., Duke Univ. (USA) . . . . [9454-47]

Leveraging robust principal component analysis to detect buried explosive threats in handheld ground-penetrating radar data, Dmitry Kalika, Mary Knox, Peter A. Torrione, Leslie M. Collins, Kenneth D. Morton Jr., Duke Univ. (USA) . . . . [9454-48]

Anomaly detection of subsurface objects using handheld ground-penetrating radar, Dominic K. Ho, Univ. of Missouri (USA); Samuel Harris, Univ. of Missouri-Columbia (USA); Alina Zare, Matthew Cook, Univ. of Missouri (USA) . . . . [9454-49]

SESSION 13. . . . . WED 4:30 PM TO 5:10 PM

Neutron Beam

Session Chairs: **Anthony A. Faust,** Defence Research and Development Canada, Suffield (Canada); **J. Paul Farrell,** Brookhaven Technology Group, Inc. (USA)

A kinematically-focused neutron beam system to detect surface and buried threats, J. Paul Farrell, Brookhaven Technology Group, Inc. (USA); Michael Vyvoda, Ted Smick, Noah Smick, GT Advanced Technologies (USA); Noel A. Guardala, Naval Surface Warfare Ctr. Carderock Div. (USA) . . . . [9454-50]

Tagged neutron capabilities for detecting hidden explosives, Sergei G. Belichenko, All-Russia Research Institute of Automatics (Russian Federation) . . . . [9454-51]

Thursday 23 April

SESSION 14 . . . . THU 8:20 AM TO 10:00 AM

Maritime Signal Processing I

Session Chairs: **Tesfaye G-Michael,** Naval Surface Warfare Ctr. Panama City Div. (USA); **John G. Baylog,** Naval Undersea Warfare Ctr. (USA)

Information surfing with the JHU/APL coherent imager, Christopher R. Ratto, Kara R. Shipley, Nathaniel Beagley, Kevin C. Wolfe, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . . [9454-52]

Multiple pass collaborative search in the presence of false alarms, John G. Baylog, Thomas A. Wettergren, Naval Undersea Warfare Ctr. (USA) . . . [9454-53]

A solution to the multiple view object detection problem, Syed U. Gilani, Apoorva Shende, Daniel J. Stilwell, Virginia Polytechnic Institute and State Univ. (USA); Bao Nguyen, Defence Research and Development Canada (Canada) . . . . [9454-54]

Possibilistic context identification for SAS imagery, Xiaoxiao Du, Alina Zare, Univ. of Missouri-Columbia (USA); James T. Cobb, Naval Surface Warfare Ctr. Panama City Div. (USA). . . . . [9454-55]

Dictionary learning for sparse sonar image representations, Jason C. Isaacs, Naval Surface Warfare Ctr. Panama City Div. (USA) . . . . [9454-56]

SESSION 15 . . . . THU 10:30 AM TO 11:50 AM

Maritime Signal Processing II

Session Chairs: **John G. Baylog,** Naval Undersea Warfare Ctr. (USA); **Tesfaye G-Michael,** Naval Surface Warfare Ctr. Panama City Div. (USA)

Investigation of measureable parameters that correlate with automated target recognition performance in synthetic aperture sonar, Julia Gazagnaire, Jason C. Isaacs, Naval Surface Warfare Ctr. Panama City Div. (USA) . . . . [9454-57]

Unsupervised 3D scene understanding and prediction to enable adaptable approximate solutions to the art gallery problem and watchman route problem, Bruce A. Johnson, Vatana An, Naval Surface Warfare Ctr. Panama City Div. (USA); Hairong Qi, The Univ. of Tennessee Knoxville (USA). . . [9454-58]

Polar format algorithm for cooperative radar engagement SAR imaging, Tesfaye G-Michael, Naval Surface Warfare Ctr. Panama City Div. (USA); Rodney G. Roberts, Florida State Univ. (USA); Thomas L. Lewis, Air Force Research Lab. (USA) . . . . [9454-59]

Automated area segmentation for ocean bottom surveys, John C. Hyland, Cheryl M. Smith, Naval Surface Warfare Ctr. Panama City Div. (USA) . . [9454-60]

CONFERENCE 9455

Tuesday–Thursday 21–23 April 2015 • Proceedings of SPIE Vol. 9455

Chemical, Biological, Radiological, Nuclear, and Explosives (CBRNE) Sensing XVI

Conference Chair: **Augustus Way Fountain III,** U.S. Army Edgewood Chemical Biological Ctr. (USA)

Program Committee: **Jerome J. Braun,** (USA); **Sylvie Buteau,** Defence Research and Development Canada, Valcartier (Canada); **James P. Carney,** Sandia National Labs. (USA); **Christopher C. Carter,** Johns Hopkins Univ. Applied Physics Lab. (USA); **Darren K. Emge,** U.S. Army Edgewood Chemical Biological Ctr. (USA); **Jason A. Guicheteau,** U.S. Army Edgewood Chemical Biological Ctr. (USA); **Eric J. Houser,** U.S. Dept. of Homeland Security (USA); **Chris R. Howle,** Defence Science and Technology Lab. (United Kingdom); **Harry Ing,** Bubble Technology Industries, Inc. (Canada); **Timothy J. Johnson,** Pacific Northwest National Lab. (USA); **Aaron LaPointe,** U.S. Army RDECOM CERDEC NVESD (USA); **Paul M. Pellegrino,** U.S. Army Research Lab. (USA); **James Placke Jr.,** Y-12 National Security Complex (USA); **Cynthia R. Swim,** U.S. Army Edgewood Chemical Biological Ctr. (USA); **Anna Tedeschi,** Strategic Analysis, Inc. (USA), U. S. Dept. of Homeland Security {United States); **Steven W. Waugh,** Defense Threat Reduction Agency (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 10:30 AM TO 11:50 AM

Radiological Detection

Session Chair: **James Placke Jr.,**
Y-12 National Security Complex (USA)

Neutron spectroscopy using InP scintillator, Veerendra K. Mathur, Naval Surface Warfare Ctr. Carderock Div. (USA); Johnathan Wensman, Naval Surface Warfare Ctr. Carderock Div. (USA) and Georgetown Univ. (USA); Noel A. Guardala, Naval Surface Warfare Ctr. Carderock Div. (USA); John F. Currie, Georgetown Univ. (USA) . . . . [9455-1]

Subwavelength films for standoff radiation dosimetry, Kyle J. Alvine, Bruce E. Bernacki, Wendy D. Bennett, Daniel L. Edwards, Albert M. Mendoza, Jonathan D. Suter, Pacific Northwest National Lab. (USA). . . . . [9455-2]

Dehydration of uranyl nitrate hexahydrate to uranyl nitrate trihydrate under ambient conditions as observed via dynamic infrared reflectance spectroscopy, Timothy J. Johnson, Lucas E. Sweet, David E. Meier, Pacific Northwest National Lab. (USA); Edward J. Mausolf, Pacific Northwest National Lab. (USA) and Univ. of Nevada, Las Vegas (USA); Eunja Kim, Univ. of Nevada, Las Vegas (USA); Philippe F. Weck, Sandia National Labs. (USA); Edgar C. Buck, Bruce K. McNamara, Pacific Northwest National Lab. (USA). . . . . [9455-3]

Effects of sample preparation on the infrared reflectance spectra of powders, Carolyn S. Brauer, Timothy J. Johnson, Tanya L. Myers, Yin-Fong Su, Thomas A. Blake, Pacific Northwest National Lab. (USA); Brenda M. Forland, Red Rocks Community College (USA) . . . . [9455-4]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 2 . . . . .TUE 1:20 PM TO 3:00 PM

Radiological Detection II

Session Chair: **James Placke Jr.,**
Y-12 National Security Complex (USA)

Use of CLYC spectrometer in counter-terrorism applications, Harry Ing, Bubble Technology Industries, Inc. (Canada) . . . . [9455-5]

Elimination of nuisance alarms through the use of HPGe in primary cargo/ passenger radiation portal applications, Joseph B. McCabe, AMETEK, Inc. (USA) . . . . [9455-6]

Single-device measurement of chemical, radiological, nuclear, and explosive threats, Joseph B. McCabe, AMETEK, Inc. (USA) . . . . [9455-7]

Exploratory research in the HPGe: operation at elevated temperatures to achieve advanced rdeduced nuclear/radiological threat detection systems, Joseph B. McCabe, AMETEK, Inc. (USA) . . . . [9455-8]

Order of magnitude size reduction in HPGe-based radioisotope identification devices (RIID) for the advancement of nuclear/radiological threat detection systems, Joseph B. McCabe, AMETEK, Inc. (USA). . . [9455-9]

SESSION 3 . . . . .TUE 3:30 PM TO 5:10 PM

Biological Detection

Session Chair: **Steven W. Waugh,**
Defense Threat Reduction Agency (USA)

Quartz crystal microbalance biosensor for rapid detection of aerosolized microorganisms, Zdenek Farka, David Kovár, Petr Skládal, Masaryk Univ. (Czech Republic) . . . . [9455-10]

Standoff detection and classification procedure for bioorganic compounds by hyperspectral laser-induced fluorescence, Anita Hausmann, Frank Duschek, Thomas Fischbach, Carsten Pargmann, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany); Valeri Alekseyev, Innokenti Sobolev, Larisa Porovkina, Sergey Babichenko, Laser Diagnostic Instruments AS (Estonia); Jürgen Handke, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany) . . . . [9455-11]

Bioaerosol detection and classification using dual excitation wavelength laser-induced fluorescence, Per Jonsson, Pär Wästerby, Per-Åke Gradmark, Julia Hedborg, Anders Larsson, Lars Landström, FOI (Sweden) . . . . . . [9455-12]

Discovery and characterization of anti-PA peptide reagents by bacterial display using a semi-automated method, Deborah A. Sarkes, U.S. Army Research Lab. (USA); Brandi L. Dorsey, Federal Staffing Resources (USA); Amethist S. Finch, Dimitra N. Stratis-Cullum, U.S. Army Research Lab. (USA) . . . . [9455-13]

Multisense chip: continuously working air monitoring system: An integrated system for the detection of airborne biological pathogens on molecular and immunological level, Claudia Gärtner, Holger Becker, Nadine Hlawatsch, Richard Klemm, Sebastian Schattschneider, Christian Moche, microfluidic ChipShop GmbH (Germany) . . . . [9455-14]

Wednesday 22 April

SESSION 4 . . . . WED 1:00 PM TO 4:10 PM

Algorithms for CBRNE Sensing

Session Chair: **Darren K. Emge,**
U.S. Army Edgewood Chemical Biological Ctr. (USA)

Hyperspectral image analysis for detection of explosive substances using IR laser standoff spectroscopy, Jan-Philip Jarvis, Frank Fuchs, Stefan Hugger, Quankui K. Yang, Ralf Ostendorf, Christian Schilling, Wolfgang Bronner, Rachid Driad, Rolf Aidam, Joachim Wagner, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany) . . . . [9455-15]

Massive classification and automated identification of explosives through Raman spectroscopy and artificial neural networks, Salvatore Almaviva, Antonio Palucci, Sabina Botti, Giovanni Dipoppa, Adriana Puiu, ENEA (Italy) . . . . [9455-16]

Bioinspired digital signal processing for fast radionuclide mixture identification, Mathieu Thevenin, Olivier Bichler, Cheick Thiam, Christophe Bobin, Commissariat à l'Énergie Atomique (France). . . . . [9455-17]

Single-wavelength lidar retrieval algorithm of particulate matter concentration using CELiS (compact eyesafe lidar system) a 1.5 µm elastic lidar system, Alan W. Bird, Kori D. Moore, Michael D. Wojcik, Robert Lemon, Utah State Univ. (USA) . . . . [9455-18]

Maximum discrimination approach for classification of nearly identical signatures, Darren K. Emge, U.S. Army Edgewood Chemical Biological Ctr. (USA); Steven Kay, The Univ. of Rhode Island (USA) . . . . [9455-19]

Non-specific sensor arrays for chemical detection, Kevin J. Johnson, U.S. Naval Research Lab. (USA); Christian P. Minor, Nova Research, Inc. (USA) . . . . [9455-20]

Removal of nonresonant background in MCARS spectra using Fourier filtering, Stephen D. Roberson, Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . [9455-21]

Trace explosives detection using photo-thermal infrared imaging spectroscopy (PT-IRIS): theory, modeling, and detection algorithms, Robert Furstenberg, Christopher A. Kendziora, Michael R. Papantonakis, Viet Nguyen, Jeff M. Byers, R. Andrew McGill, U.S. Naval Research Lab. (USA) . . . . [9455-22]

Thursday 23 April

SESSION 5 . . . . .THU 8:00 AM TO 10:20 AM

Chemical Sensing I

Session Chair: **Christopher R. Howle,** Defence Science and Technology Lab. (United Kingdom)

Intracavity optical parametric oscillators based upon orientation-patterned GaAs (OPGaAs): development toward a flexible deep-infrared active hyperspectral imaging system *(Invited Paper)*, David M. Stothard, Fraunhofer Ctr. for Applied Photonics (United Kingdom); Daniel J. Kane, Fraunhofer Ctr, for Applied Photonics (United Kingdom); Peter G. Schunemann, BAE Systems (USA); Malcolm H. Dunn, Malcolm H. Dunn, Univ. of St. Andrews (United Kingdom) . . . . [9455-23]

New plasmonic materials and fabrication tools for near- and mid-infrared sensing *(Invited Paper)*, Otto L. Muskens, Yudong Wang, Leo-Jay Black, Cornelis Hendrik de Groot, Univ. of Southampton (United Kingdom); Arnaud Arbouet, Ctr. d'Elaboration de Matériaux et d'Etudes Structurales (France) . . . . [9455-24]

Detection of chemical clouds using widely tunable quantum cascade lasers, Anish K. Goyal, Petros Kotidis, Erik R. Deutsch, Ninghui Zhu, Mark Norman, Jim Ye, Kostas Zafiriou, Alexander Mazurenko, Block Engineering, LLC (USA). . . . . [9455-25]

Detecting liquid contamination on surfaces using hyperspectral imaging data, Russell E. Warren, EO-Stat, Inc. (USA); David B. Cohn, DBC Technology Corp. (USA); Marc-André Gagnon, Vincent Farley, Telops (Canada) . . . [9455-26]

The development of a wide-field, high-resolution UV Raman hyperspectral imager, Nathaniel R. Gomer, Matthew P. Nelson, ChemImage Corp. (USA); Stanley M. Angel, Univ. of South Carolina (USA) . . . . [9455-27]

Advanced shortwave infrared and Raman hyperspectral sensors for homeland security and law enforcement operations, Matthew P. Nelson, Chuck Gardner, Nathaniel R. Gomer, ChemImage Corp. (USA). . . . . . . [9455-28]

SESSION 6 . . . . THU 10:50 AM TO 11:50 AM

Explosives Sensing

Session Chair: **Aaron LaPointe,** U.S. Army Night Vision & Electronic Sensors Directorate (USA)

Characterization of inkjet-printed explosive materials, Mikella E. Farrell, Ellen L. Holthoff, Logan S. Marcus, Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . [9455-29]

Stand-off detection of explosives and precursors in realistic environments using UV coded aperture Raman spectroscopy, Mattias Svanqvist, Markus Nordberg, Henric Östmark, Swedish Defence Research Agency (Sweden) . . . . [9455-30]

Advances in sublimation studies for particles of explosives, Robert Furstenberg, Tara Abrishami, Michael R. Papantonakis, Christopher A. Kendziora, David R. Mott, R. Andrew McGill, U.S. Naval Research Lab. (USA) . . . . [9455-32]

Lunch/Exhibition Break . . . . Thu 11:50 am to 1:20 pm

SESSION 7 . . . . THU 1:20 PM TO 2:40 PM

Chemical Sensing II

Session Chair: **Jason A. Guicheteau,** U.S. Army Edgewood Chemical Biological Ctr. (USA)

Experimental examination of ultraviolet Raman cross sections of chemical warfare agent simulants, Fredrik Kullander, Lars Landström, Hampus Lundén, Göran Olofsson, Pär Wästerby, Swedish Defence Research Agency (Sweden) . . . . [9455-33]

Photoacoustic chemical sensing: layered systems and excitation source analysis, Logan S. Marcus, Ellen L. Holthoff, Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . [9455-34]

Cooperative use of standoff and UAV sensors for CBRNE detection, William J. Marinelli, Thomas Schmit, Julia Rentz Dupuis, David Manegold, Physical Sciences Inc. (USA); Manal Beshay, Marvin Lav, Intelligent Optical Systems, Inc. (USA). . . . . [9455-35]

Detection of munitions grade chemical warfare agents using Raman excitation at 1064 nm, Eric G. Roy, Rigaku Raman Technologies, Inc. (USA); Phillip G. Wilcox, Soren Hoffland, U.S. Army Edgewood Chemical Biological Ctr. (USA); Ian Pardoe, EXCET, Inc. (USA). . . . . [9455-36]

SESSION 8 . . . . THU 3:30 PM TO 4:50 PM

Chemical Sensing III

Session Chair: **Augustus Way Fountain III,** U.S. Army Edgewood Chemical Biological Ctr. (USA)

A molecularly imprinted polymer (MIP)-coated microbeam MEMS sensor for chemical detection, Ellen L. Holthoff, U.S. Army Research Lab. (USA); Lily Li, Kimberly L. Turner, Tobias Hiller, Univ. of California, Santa Barbara (USA) . . . . [9455-37]

A study of single-beam femtosecond MCARS in trace material detection, Stephen D. Roberson, Paul M. Pellegrino, U.S. Army Research Lab. (USA) . . . . [9455-38]

Differential excitation spectroscopy for detection of chemical threats: DMMP and thiodiglycol, Boyd V. Hunter, Jason M. Cox, Kestrel Corp. (USA); Michael A. Miller, Southwest Research Institute (USA); Paul Harrison, William P. Walters, Kestrel Corp. (USA) . . . . [9455-39]

Breadboard sized photo-acoustic spectroscopy system using an FPGA based lock-in amplifier, John F. Schill, U.S. Army Research Lab. (USA) . . . . [9455-40]

CONFERENCE 9456

Monday–Wednesday 20–22 April 2015 • Proceedings of SPIE Vol. 9456

Sensors, and Command, Control, Communications, and Intelligence (C3I) Technologies for Homeland Security, Defense, and Law Enforcement Applications XIV

Conference Chair: **Edward M. Carapezza,** EMC Consulting, LLC (USA)

Program Committee: **George Cybenko,** Thayer School of Engineering at Dartmouth (USA); **Panos G. Datskos,** Oak Ridge National Lab. (USA); **Gregory L. Duckworth,** BBN Technologies, a Raytheon Co. (USA); **Susan F. Hallowell,** Transportation Security Lab. (USA), Dept. of Homeland Security (USA); **Todd M. Hintz,** Space and Naval Warfare Systems Command (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Pradeep K. Khosla,** Univ. of California, San Diego (USA); **Daniel Lehrfeld,** Blue Marble Group LLC (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA); **Jordan Wexler,** Raytheon Applied Signal Technology, Inc. (USA)

Monday 20 April

SESSION 1. . . . . MON 8:30 AM TO 11:10 AM

Chemical, Concealed Weapons, Through-the-Wall Sensor and Material Technologies and Systems

Session Chairs: **Panos G. Datskos,** Oak Ridge National Lab. (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Edward M. Carapezza,** EMC Consulting, LLC (USA)

Detection of chemicals using quantum cascade laser spectroscopy *(Keynote Presentation)*, Panos G. Datskos, Marissa E. Morales-Rodríguez, Phillip Bingham, Larry R. Senesac, David Graham, Ilia Ivanov, Kenneth W. Tobin Jr., Oak Ridge National Lab. (USA). . . . . [9456-1]

Demonstration of novel high-power acoustic through-the-wall sensor, Franklin Felber, Starmark, Inc. (USA) . . . . [9456-2]

The use of short and wide x-ray pulses for time-of-flight x-ray Compton scatter imaging in cargo security, Nick Calvert, Marta M. Betcke, Univ. College London (United Kingdom); John R. Cresswell, Univ. of Liverpool (United Kingdom); Alick N. Deacon, The Univ. of Manchester (United Kingdom); Anthony J. Gleeson, Science and Technologies Facilities Council (United Kingdom); Daniel S. Judson, Univ. of Liverpool (United Kingdom); Peter Mason, Rapiscan Systems Ltd. (United Kingdom); Peter A. McIntosh, Science and Technologies Facilities Council (United Kingdom); Edward J. Morton, Rapiscan Systems Ltd. (USA); Paul J. Nolan, Univ. of Liverpool (United Kingdom); James Ollier, Mark G. Procter, Rapiscan Systems Ltd. (United Kingdom); Robert D. Speller, Univ. College London (United Kingdom) . . . . [9456-3]

Consideration of the use of visible light 3D scanning for prisoner contraband possession assessment and other similar purposes, Jeremy Straub, Univ. of North Dakota (USA). . . . . [9456-4]

Optically transparent superhydrophobic coatings for enhanced performance sensing and CSP and CPV power generations, Scott R. Hunter, D. Barton Smith, Georgios Polizos, Daniel A. Schaeffer, Panos G. Datskos, Oak Ridge National Lab. (USA). . . . . [9456-5]

Ultra-strong and electrically conductive graphene fibers, Panos G. Datskos, Ivan Vlassiouk, Oak Ridge National Lab. (USA) . . . . [9456-6]

SESSION 2 . . . . MON 11:10 AM TO 12:10 PM

Counter Sniper, Projectile, and Gunfire Localization

Session Chairs: **Gregory L. Duckworth,** BBN Technologies, a Raytheon Co. (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA)

Acoustic and infrared active shooter detection and reporting, Ron Fowler, Chris Connors, Shooter Detection Systems LLC (USA) . . . . [9456-7]

An agnostic acoustic smart sensor network for hostile fire detection with sensor fusion capability, George Cakiades, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . [9456-8]

Target plane projectile location sensor system, Slobodan Rajic, William R. Lawrence, Panos G. Datskos, Oak Ridge National Lab. (USA); Ross W. Towers, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . [9456-9]

Lunch Break . . . . .Mon 12:10 pm to 1:40 pm

SESSION 3 . . . . .MON 1:40 PM TO 4:30 PM

Infrastructure Protection and Counter Terrorism 1

Session Chairs: **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA); **Gregory L. Duckworth,** Raytheon Cr. (USA)

A low-cost FMCW radar for footprint and personnel detection from a mobile platform, David Boutte, Paul Taylor, AKELA, Inc. (USA) . . . . . . [9456-10]

Optically resonant subwavelength films for tamper-indicating tags and seals, Kyle J. Alvine, Jonathan D. Suter, Bruce E. Bernacki, Wendy D. Bennett, Pacific Northwest National Lab. (USA) . . . . [9456-11]

Multi-capability color night vision HD camera for defense, surveillance, and security applications, Francis Pang, e2v Aerospace and Defense, Inc. (USA) . . . . [9456-12]

Analysis of a mutual assured destruction-like scenario with swarms of non-recallable autonomous robots, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9456-13]

Performance of a buried microphone to detect voice and footsteps, Thyagaraju Damarla, U.S. Army Research Lab. (USA) . . . . [9456-14]

Surveillance systems for intermodal transportation, Miroslav Voznak, VŠB-Technical Univ. of Ostrava (Czech Republic); Sergej Jakovlev, Arunas Andziulis, Klaipeda Univ. (Lithuania) . . . . [9456-15]

Unmanned aerial vehicles (UAVs): a new tool in counterterrorism operations?, Mehmet F. Dörtbudak, Turkish Air War College (Turkey) . [9456-16]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

THIS PROGRAM IS CURRENT AS OF DECEMBER 2014

Tuesday 21 April

SESSION 4 . . . . .TUE 8:00 AM TO 9:20 AM

Cyber Crimes, Cyberterrorism, and Law Enforcement Technologies and Systems

Session Chairs: **George Cybenko,** Thayer School of Engineering at Dartmouth (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Edward M. Carapezza,** EMC Consulting, LLC (USA); **Jordan Wexler,** Raytheon Applied Signal Technology, Inc. (USA)

Deep learning of behaviors *(Keynote Presentation)*, George Cybenko, Thayer School of Engineering at Dartmouth (USA) . . . . [9456-17]

National Institute of Justice: Science and Technology Office initiatives *(Keynote Presentation)*, William A. Ford, U.S. Dept of Justice (USA) . . . [9456-18]

SESSION 5 . . . . TUE 9:20 AM TO 10:40 AM

Cyber Crimes, Cyberterrorism, and Law Enforcement

Session Chair: **Jordan Wexler,** Raytheon Applied Signal Technology, Inc. (USA); **George Cybenko,** Thayer School of Engineering at Dartmouth (USA)

Quantification of moving target cyber defenses, Katheryn A. Farris, George Cybenko, Thayer School of Engineering at Dartmouth (USA). . . . . [9456-19]

Enterprise scale cyber risk assessment and management, Jeff Hughes, Tenet 3, LLC (USA); George Cybenko, Thayer School of Engineering at Dartmouth (USA) . . . . [9456-20]

Tensor transform-based method of image encryption, Artyom M. Grigoryan, Bryan A. Wiatrek, The Univ. of Texas at San Antonio (USA). . . . . [9456-21]

An exact computational method for performance analysis of sequential test algorithms for detecting network intrusions, Xinjia Chen, Frederick W. Lacy, Patrick Carriere, Southern Univ. and A&M College (USA). . . . . . . [9456-22]

SESSION 6 . . . . TUE 11:00 AM TO 12:20 PM

C3I Systems and Technologies 1

Session Chairs: **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

Bayesian truthing as experimental verification of C4ISR sensors, Tomasz P. Jannson, Thomas C. Forrester, Andrew A. Kostrzewski, Physical Optics Corp. (USA) . . . . [9456-23]

Stochastic optimization of space-time constellations, Xinjia Chen, Patrick Carriere, Frederick W. Lacy, Southern Univ. and A&M College (USA) . . [9456-24]

ATAK: situation awareness for the network edge, Kyle Usbeck, Matthew Gillen, Joseph P. Loyall, Andrew Gronosky, Simon Chase, Raytheon BBN Technologies (USA); Todd Krokowski, PAR Government Systems Corp. (USA); Kelly Hanlon, Andrew Scally, WinTec Arrowmaker, Inc. (USA); Joshua Sterling, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Ralph L. Kohler Jr., Richard Newkirk, David Canestrare, Air Force Research Lab. (USA) [9456-25]

Adaptive randomized algorithms for analysis and design of control systems under uncertain environments, Xinjia Chen, Southern Univ. and A&M College (USA) . . . . [9456-26]

Lunch/Exhibition Break . . . . Tue 12:20 pm to 1:40 pm

SESSION 7 . . . . .TUE 1:40 PM TO 3:20 PM

C3I Systems and Technologies II

Session Chairs: **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

Vulnerabilities in GSM technology and feasibility of selected attacks, Miroslav Voznak, Martin Prokes, Miralem Mehic, Lukas Sevcik, Jaroslav Frnda, Martin Mikulec, Zdenka Chmelikova, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . . [9456-27]

PACT DSS: a decision support system for privacy impact assessment of future security investments, Stelios C Thomopoulos, Dimitris Kyriazanos, Anastassios Bravakis, Olga Segou, NCSR Demokritos (Greece) . . . . . . [9456-28]

Anomalies, singularities, and catastrophes in C3ISR systems, Tomasz P. Jannson, Pedram Boghrat, Thomas C. Forrester, Thomas Nielsen, Andrew A. Kostrzewski, Physical Optics Corp. (USA) . . . . [9456-29]

The next-generation of command post computing, Ross Arnold, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . . . [9456-30]

DXBC: a long distance wireless broadband communication system for coastal maritime surveillance applications, Stelios C Thomopoulos, George Vastianos, NCSR Demokritos (Greece). . . . . [9456-31]

SESSION 8 . . . . TUE 3:50 PM TO 5:30 PM

Infrastructure Protection and Counter Terrorism II

Session Chairs: **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

Precision tracking of low radar cross-section targets, Amanda Keeshen, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . [9456-32]

Remote ballistic emplacement of an electro-optical and acoustic target detection and localization system, Aaron West, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . [9456-33]

Picatinny optical detection system (PODS), Gerard Gaeta, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . . . [9456-34]

Installation as a system, Robert Giarratano, Mike Cazzola, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . . . [9456-35]

Flexible fire control system (F2CS), Jose G. Vergara, U.S. Army Armament Research, Development and Engineering Ctr. (USA) . . . . [9456-36]

Wednesday 22 April

SESSION 9 . . . . .WED 8:00 AM TO 9:20 AM

Infrastructure Protection: Emerging Technologies and Future Systems

Session Chairs: **Edward M. Carapezza; Tariq Manzur,** Naval Undersea Warfare Ctr. (USA)

THz technology *(Keynote Presentation)*, Manijeh Razeghi, Northwestern Univ. (USA) . . . . [9456-37]

RF photonics for next-generation electronic warfare *(Keynote Presentation)*, Josh Conway, Defense Advanced Research Projects Agency (USA) . . . . [9456-38]

CONFERENCE 9456

SESSION 10 . . . . WED 9:20 AM TO 10:20 AM

Infrastructure Protection: Undersea and Maritime Technologies and Systems I

Session Chairs: **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA)

Laser beam propagation through an atmospheric transitional and turbulent boundary layer, Richard A. Katz, Naval Undersea Warfare Ctr. (USA) . [9456-39]

Challenges of laser beam propagation near and within the marine boundary layer, Tariq Manzur, Richard A. Katz, Naval Undersea Warfare Ctr. (USA) . . . . [9456-40]

Patterning for success, Theresa Baus, Naval Undersea Warfare Ctr. (USA) . . . . [9456-41]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 11. . . . . WED 1:20 PM TO 4:10 PM

Infrastructure Protection: Undersea and Maritime Technologies and Systems II

Session Chairs: **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA)

Optical metamaterials for submarine applications, Jose G. Barbosa, Naval Undersea Warfare Ctr. (USA) . . . . [9456-42]

Nonlinear acoustic modeling for undersea sensors, Richard A. Katz, Naval Undersea Warfare Ctr. (USA) . . . . [9456-43]

Navigational lights color study, Jose G. Barbosa, Naval Undersea Warfare Ctr. (USA) . . . . [9456-44]

Fundamentals of optical signal-based MWIR uncooled silicon carbide sensor for DoD/DHS applications, Geunsik Lim, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA). . . . . [9456-45]

Image processing in a maritime environment, Kenneth A. Pietrzak, Naval Undersea Warfare Ctr. (USA) . . . . [9456-46]

Submarine meteorological sensor, Jose G. Barbosa, Naval Undersea Warfare Ctr. (USA). . . . . [9456-47]

The transition from intelligence cycle to intelligence process: network-centric intelligence in narrow seas, Engin Büker, Turkish Naval War College (Turkey) . . . . [9456-48]

SESSION 12 . . . . WED 4:10 PM TO 5:30 PM

Infrastructure Protection: Air Operations

Session Chairs: **Tariq Manzur,** Naval Undersea Warfare Ctr. (USA); **Myron E. Hohil,** U.S. Army Armament Research, Development and Engineering Ctr. (USA)

The impact on air operations of ballistic missiles, Hasan Durak, Turkish Air Force Academy (Turkey) . . . . [9456-49]

Usage of turboprop aircrafts for counter terror missions, Eray Akin, Salim Oncu, Turkish Air War College (Turkey) . . . . [9456-50]

Human factor in future air command and control systems, Fatih Buyruk, Harun R. Altun, Ferhat Pinar, Turkish Air War College (Turkey) . . . . [9456-51]

Future's operation areas: new-generation suppression enemy air defence (SEAD) elements, Ilker Hazinedar, Yucel Canbolat, Turkish Air War College (Turkey) . . . . [9456-52]

CONFERENCE 9457

Wednesday 22 April 2015 • Proceedings of SPIE Vol. 9457

Biometric and Surveillance Technology for Human and Activity Identification XII

Conference Chairs: **Ioannis A. Kakadiaris,** Univ. of Houston (USA); **Ajay Kumar,** The Hong Kong Polytechnic Univ. (Hong Kong, China); **Walter J. Scheirer,** Harvard Univ. (USA)

Program Committee: **J. Ross Beveridge,** Colorado State Univ. (USA); **Christopher Bensing Boehnen,** Oak Ridge National Lab. (USA); **Terrance E. Boult,** Univ. of Colorado at Colorado Springs (USA); **Thirimachos Bourlai,** West Virginia Univ. (USA); **Rama Chellappa,** Univ. of Maryland, College Park (USA); **Bernadette Dorizzi,** TELECOM & Management SudParis (France); **Julian Fierrez,** Univ. Autónoma de Madrid (Spain); **Brian C. Heflin,** Univ. of Colorado at Colorado Springs (USA); **Daniel P. Lopresti,** Lehigh Univ. (USA); **Norman Poh,** Univ. of Surrey (United Kingdom); **Nalini K. Ratha,** IBM Thomas J. Watson Research Ctr. (USA); **Anderson Rocha,** Univ. Estadual de Campinas (Brazil); **Arun A. Ross,** Michigan State Univ. (USA); **Natalia A. Schmid,** West Virginia Univ. (USA); **Stephanie Schuckers,** Clarkson Univ. (USA); **William R. Schwartz,** UFMG (Brazil); **Shishir Shah,** Univ. of Houston (USA); **Kar-Ann Toh,** Yonsei Univ. (Korea, Republic of); **Raymond N. J. Veldhuis,** Univ. Twente (Netherlands); **Ruigang Yang,** Univ. of Kentucky (USA)

Wednesday 22 April

SESSION 1. . . . . WED 8:00 AM TO 9:00 AM

Biometric Privacy

Session Chair: **Walter J. Scheirer,** Harvard Univ. (USA)

Implementation and optimization of a biometric cryptosystem using iris recognition, Charles McGuffey, Chen Liu, Stephanie Schuckers, Clarkson Univ. (USA) . . . . [9457-1]

Fingerprint + Iris = IrisPrint, Asem A. Othman, Arun A. Ross, Michigan State Univ. (USA) . . . . [9457-2]

Identifying bitcoin users by transaction behavior, John V. Monaco, Pace Univ. (USA) . . . . [9457-3]

SESSION 2 . . . . WED 9:00 AM TO 10:00 AM

Human Behavior

Session Chair: **Ajay Kumar,**
The Hong Kong Polytechnic Univ. (Hong Kong, China)

Human actions recognition in confined spaces and under partial observability constraints, Amir Shirkhodaie, Tennessee State Univ. (USA); Alex L. Chan, Shuowen Hu, U.S. Army Research Lab. (USA). . . . . [9457-4]

Gait as a biometric using relevant features from biomechanics, Anthony H. Hawes, Jeffrey B. Flora, Khan M. Iftekharuddin, Old Dominion Univ. (USA) . . . . [9457-5]

Human task performance baseline: results from a cross-band facial identification perception study, Kenneth A. Byrd, Hee-Sue Choi, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9457-6]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 3 . . . . WED 1:00 PM TO 2:00 PM

Keynote Session

Session Chair: **Ioannis A. Kakadiaris,** Univ. of Houston (USA)

Keynote Presentaiton . . . . [9457-7]

SESSION 4 . . . . WED 2:00 PM TO 3:00 PM

Iris and Eye Movement

Session Chair: **Walter J. Scheirer,** Harvard Univ. (USA)

A gallery approach for off-angle iris recognition, Mahmut Karakaya, Rashiduddin Yoldash, Meliksah Univ. (Turkey) . . . . [9457-8]

Neurological disorder identification by eye movement biometric using machine learning schemes, Vivek Srivastava, Rama Univ. (India); Pipin K. Tripathi, Harcourt Butler Technological Institute (India). . . . . [9457-9]

An indexing method for color iris images, Simona G. Crihalmeanu, Arun A. Ross, Michigan State Univ. (USA) . . . . [9457-10]

SESSION 5 . . . . WED 3:30 PM TO 4:30 PM

Lightning Talk Session

Session Chair: **Ajay Kumar,**
The Hong Kong Polytechnic Univ. (Hong Kong, China)

Deep learning and face recognition: the state of the art, Stephen Balaban, Lambda Labs (USA) . . . . [9457-11]

Computational cameras for iris recognition, Scott McCloskey, Sharath Venkatesha, Honeywell Automation & Control Solutions (USA) [9457-12]

Privacy issues of biometric technologies in real-world applications, Emanuela Marasco, West Virginia Univ. (USA); Bojan Cukic, The Univ. of North Carolina at Charlotte (USA) . . . . [9457-13]

Anti-spoofing for display and print spoof attacks on palmprint verification systems, Vivek Kanhangad, Shruti Bhilare, Narendra S. Chaudhari, Indian Institute of Technology Indore (India) . . . . [9457-14]

Investigation of human behaviour using biometrics, Murugesh S. Subramani, Kalaimagal V., Meerasri M., Venkatesh C., EBET Group of Institutions (India). . . . . [9457-15]

Biometrics and IRB best practices, Christopher B Boehnen, Oak Ridge National Lab (USA); David Bolme, UT-Battelle (USA); Patrick Flynn, University of Notre Dame (USA). . . . . [9457-16]

SESSION 6 . . . . WED 4:30 PM TO 5:10 PM

Novel Modalities and Surveillance

Session Chair: **Ioannis A. Kakadiaris,** Univ. of Houston (USA)

Open-set speaker identification with diverse-duration speech data, Rawande Karadaghi, Heinz Hertlein, Aladdin M. Ariyaeeinia, Univ. of Hertfordshire (United Kingdom). . . . . [9457-17]

Multisensor concealed weapon detection using image fusion approach, Tuzhi Xu, Q. M. Jonathan Wu, Univ. of Windsor (Canada) . . . . [9457-18]

SESSION 7 . . . . WED 5:10 PM TO 5:50 PM

Emerging Perspectives in Bopmetrics

Session Chair: **Walter J. Scheirer,** Harvard Univ. (USA)

TBD, Ioannis A. Kakadiaris, Univ. of Houston (USA) . . . . [9457-19]

An automated watchlist identification system for higher security at the border crossings, Ajay Kumar, The Hong Kong Polytechnic University (Hong Kong, China) . . . . [9457-20]

CONFERENCE 9458

Tuesday 21 April 2015 • Proceedings of SPIE Vol. 9458

Cyber Sensing 2015

Conference Chairs: **Igor V. Ternovskiy,** Air Force Research Lab. (USA); **Peter Chin,** Draper Lab. (USA), Boston Univ. {United States)

Program Committee: **Chad D. Heitzenrater,** Air Force Research Lab. (USA); **Tony C. Kim,** Air Force Research Lab. (USA)

Tuesday 21 April

SESSION 1. . . . . TUE 8:00 AM TO 9:00 AM

Cyber Sensing I

Image reconstruction from sub-apertures of circular spotlight SAR, Xiaohui Yuan, Univ. of North Texas (USA); Igor V. Ternovskiy, Air Force Research Lab. (USA) . . . . [9458-1]

Testing simple deceptive honeypot tools, Aymen Yahyaoui, Tunisian Air Force (Tunisia); Neil C. Rowe, Naval Postgraduate School (USA) . . . . . . [9458-2]

A prototype forensic toolkit for industrial-control-systems incident response, Nickolas B Carr, U.S. Department of Homeland Security (USA); Neil C. Rowe, Naval Postgraduate School (USA). . . . . [9458-3]

SESSION 2 . . . . .TUE 9:00 AM TO 12:15 PM

Situation Awareness

Joint Session with Conferences 9458 and 9464

Session Chairs: **Igor V. Ternovskiy,** Air Force Research Lab. (USA); **Tien Pham,** U.S. Army Research Lab. (USA)

Situational consciousness for autonomous cyberspace operations *(Keynote Presentation)*, Steven K. Rogers, Air Force Research Lab. (USA). . . . . . . [9458-4]

Situational awareness: a holistic perspective your mother was afraid to tell you, Michael A Kolodny, U.S. Army Research Lab. (USA) . . . . [9464-18]

Qualia centric hypothetical thinking: applications to vehicle tracking with the fusion of EO and SAR input data sources *(Invited Paper)*, Jonathan L. White, Harding Univ. (USA); Anthony Helmstetter, Arizona State Univ. (USA); Jared L. Culbertson, Igor V. Ternovskiy, Air Force Research Lab. (USA) . [9458-5]

Automatic video-based classification of small group behavior to support situational understanding, Robert Williams, Air Force Research Lab. (USA); Julie A. Skipper, Skipper Consulting (USA). . . . . [9464-19]

Addressing cyber information overload with cognitive modeling constructs, Sandra L. Vaughan, Air Force Institute of Technology (USA) and U.S. Defense Intelligence Agency (USA); Robert F. Mills, Michael R. Grimaila, Gilbert L. Peterson, Air Force Institute of Technology (USA); Steven K. Rogers, Air Force Research Lab. (USA) . . . . [9458-6]

Why open system approaches matter, Kevin Priddy, U.S. Air Force Research Lab. (USA) . . . . [9464-20]

Lunch/Exhibition Break . . . . .12:15 pm to 1:45 pm

SESSION 3 . . . . TUE 1:45 PM TO 3:25 PM

Cyber Sensing II

On a simulation study for reliable and secured smart grid communication, Sriharsha Mallapuram, Paul Moulema, Wei Yu, Towson Univ. (USA) . . . . [9458-7]

Risk assessment by dynamic representation of vulnerability, exploitation, and impact, Hasan Cam, U.S. Army Research Lab. (USA) . . . . [9458-8]

Network traffic correlation using autonomous system number, Steve Hutchinson, ICF International (USA); Robert F. Erbacher, U.S. Army Research Lab. (USA) . . . . [9458-9]

CyberSecurity for aerospace autonomous systems, Jeremy Straub, Univ. of North Dakota (USA). . . . . [9458-10]

Cybercrime and prospect theory: Considerations for policy efforts and the framing of 'cyber warfare', Wesley Beaver, Oxford Internet Institute (United Kingdom) . . . . [9458-11]

SESSION 4 . . . . TUE 3:55 PM TO 5:15 PM

Cyber Sensing III

Is cyber warfare threat or advantage for air operations?, Harun R. Altun, Fatih Buyruk, Ferhat Pinar, Turkish Air War College (Turkey) . . . . [9458-12]

Turkey's cyber security perception and the portion of cyber security in national defence, Mahmut Tükenmez, Turkish Air Force Academy (Turkey) . . . . [9458-13]

Network systems security analysis, Ismail Yilmaz, Turkish Air Force Academy (Turkey) . . . . [9458-14]

Efficient non-resonant absorption of electromagnetic radiation in thin cylindrical targets: experimental demonstration , Andrey Akhmeteli, LTASolid Inc. (USA); Nikolay G. Kokodiy, Boris V. Safronov, Valeriy P. Balkashin, Ivan A. Priz, V.N. Karazin Kharkiv National Univ. (Ukraine); Alexander Tarasevitch, Univ. Duisburg-Essen (Germany) . . . . [9458-15]

CONFERENCE 9459

Tuesday–Wednesday 21–22 April 2015 • Proceedings of SPIE Vol. 9459

Ocean Sensing and Monitoring VII

Conference Chairs: **Weilin W. Hou,** U.S. Naval Research Lab. (USA); **Robert A. Arnone,** The Univ. of Southern Mississippi (USA)

Program Committee: **Samir Ahmed,** The City College of New York (USA); **James H. Churnside,** National Oceanic and Atmospheric Administration (USA); **Richard L. Crout,** U.S. Naval Research Lab. (USA); **Alexander Ignatov,** NOAA National Environmental Satellite, Data, and Information Service (USA); **Linda J. Mullen,** Naval Air Systems Command (USA); **Michael S. Twardowski,** WET Labs., Inc. (USA); **Brandon Cochenour,** Naval Air Warfare Ctr. Aircraft Div. (USA)

Tuesday 21 April

OPENING REMARKS. . . . . 8:00 AM TO 8:10 AM

Session Chairs: **Weilin W. Hou,** U.S. Naval Research Lab. (USA); **Robert A. Arnone,** The Univ. of Southern Mississippi (USA)

SESSION 1. . . . . TUE 8:10 AM TO 10:20 AM

Free Space Optical Communications Underwater

Session Chair: **Brandon Cochenour,** Naval Air Warfare Ctr. Aircraft Div. (USA)

An overview of underwater blue-green optical communications *(Invited Paper)*, Greg Mooradian, Mooradian & Associates, Inc. (USA); Michael Lovern, Space and Naval Warfare Systems Ctr. Pacific (USA). . . . . [9459-1]

Common underwater free space optical (UFSO) communications architectures in support of both defense and oil and gas applications, Greg Mooradian, Mooradian & Associates, Inc. (USA) and Leidos (USA); Dean Richter, Sonalysts, Inc. (USA); Susan Harris, Leidos (USA); Stephen Szender, Liedos, Inc. (USA). . . . . [9459-2]

High bandwidth underwater optical communications: overview and practical applications, Norman E. Farr, Woods Hole Oceanographic Institution (USA) . . . . [9459-3]

Spatial multiplexing for blue lasers for undersea communications, Joshua Baghdady, Matthew Byrd, Wenzhe Li, Kaitlyn Morgan, Aaron Páng, Eric Johnson, Clemson Univ. (USA) . . . . [9459-4]

High-speed blue-light free space optical receiver, Susan Harris, Mark Krepel, Leidos (USA); Greg Mooradian, Mooradian & Associates, Inc. (USA) and Leidos (USA) . . . . [9459-5]

Airborne relay connectivity through air/ice/water interface comm (ARCTIComm) high data rate through-ice optical communication system, Dean Richter, Sonalysts, Inc. (USA); Greg Mooradian, Mooradian & Associates, Inc. (USA); Susan Harris, Stephen Szender, Leidos (USA) . . . . [9459-6]

SESSION 2 . . . . TUE 10:50 AM TO 12:30 PM

Characterization for Underwater Optical Communications

Session Chair: **Brandon Cochenour,** Naval Air Warfare Ctr. Aircraft Div. (USA)

Underwater-detector array for laser beam diagnostics, Shachak Pe'eri, Firat Eren, The Univ. of New Hampshire (USA); Jack L. Riley, National Oceanic and Atmospheric Administration (USA); May-Win Thein, Yuri Rzhanov, Matthew Birkebak, The Univ. of New Hampshire (USA) . . . . [9459-7]

Chaotic lidar for underwater channel identification, Luke K. Rumbaugh, David W. Illig, William D. Jemison, Clarkson Univ. (USA) . . . . [9459-8]

Experimental validation of a Monte Carlo model for determining the temporal response of the underwater optical communications channel, Alan Laux, Brandon Cochenour, Naval Air Warfare Ctr. Aircraft Div. (USA) . . . . . . [9459-9]

Monte Carlo model for time-dependent LIDAR return from complex 3D targets with photon path dispersion effects, Anthony Kellems, Thomas E. Giddings, Joseph J. Shirron, Metron, Inc. (USA); Linda J. Mullen, Brandon Cochenour, Derek M. Alley, Alan Laux, Robert W. Lee, Naval Air Systems Command (USA) . . . . [9459-10]

Use of polarimetric imaging for discriminating oil from water, Amber Iler, Patrick Hamilton, Integrity Applications, Inc. (USA) . . . . [9459-11]

Lunch/Exhibition Break . . . . Tue 12:30 pm to 2:00 pm

SESSION 3 . . . . TUE 2:00 PM TO 3:20 PM

Underwater Optical Imaging and Ranging

Session Chair: **Linda J. Mullen,** Naval Air Systems Command (USA)

FMCW optical ranging technique in turbid waters, David W. Illig, William D. Jemison, Clarkson Univ. (USA); Robert W. Lee, Alan Laux, Linda J. Mullen, Naval Air Systems Command (USA) . . . . [9459-12]

Pulse compression techniques to improve modulated pulsed laser line scan systems, Robert W. Lee, Naval Air Systems Command (USA) and Univ. of Maryland (USA); Linda J. Mullen, Shawn P. O'Connor, Brandon Cochenour, Naval Air Systems Command (USA) . . . . [9459-13]

DCS versus DCS: evaluation of different signal models for the underwater compressive line sensing imaging system, Bing Ouyang, Harbor Branch Oceanographic Institute (USA); Weilin W. Hou, U.S. Naval Research Lab. (USA); Frank M. Caimi, Fraser R. Dalgleish, Anni K. Vuorenkoski, Harbor Branch Oceanographic Institute (USA); Cuiling Gong, Texas Christian Univ. (USA) . . . . [9459-14]

Semi-empirical inversion technique for retrieval of quantitative attenuation profiles with underwater scanning LIDAR systems, Anni K. Vuorenkoski, Fraser R. Dalgleish, Harbor Branch Oceanographic Institute (USA); Michael S. Twardowski, WET Labs., Inc. (USA); Bing Ouyang, Harbor Branch Oceanographic Institute (USA); Charles C. Trees, STO-CMRE (Italy). . . [9459-15]

SESSION 4 . . . . .TUE 3:50 PM TO 5:10 PM

Underwater Optical Imaging and Ranging II

Session Chair: **Weilin W. Hou,** U.S. Naval Research Lab. (USA)

Analysis of polarimetric image by full stokes vector imaging camera for retrieval of target polarization in underwater environment, Yalong Gu, Carlos Carrizo, Ahmed El-Habashi, Alexander Gilerson, The City College of New York (USA). . . . . [9459-16]

The influence of the choice of the phase function on imaging under water, Katrin Braesicke, Endre Repasi, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany). . . . . [9459-17]

A controlled laboratory environment to study EO signal degradation due to underwater turbulence, Silvia C. Matt, Weilin W. Hou, Wesley Goode, Andrey V. Kanaev, Sergio R. Restaino, U.S. Naval Research Lab. (USA) . . . . . . [9459-18]

A miniature fiber-optic sensor for high-resolution and high-speed temperature and flow sensing in ocean environment, Ming Han, Univ. of Nebraska-Lincoln (USA); Weilin W. Hou, U.S. Naval Research Lab. (USA); Guigen Liu, Univ. of Nebraska-Lincoln (USA) . . . . [9459-19]

Wednesday 22 April

SESSION 5 . . . . WED 8:30 AM TO 10:30 AM

Ocean Observations and Models

Session Chair: **Robert A. Arnone,** The Univ. of Southern Mississippi (USA)

An expansion of glider observation strategies to systematically transmit and analyze preferred waypoints of underwater gliders, Lucy F. Smedstad, Charlie N. Barron, U.S. Naval Research Lab. (USA); Michael W. Brooking, Danielle A. Bryant, Naval Oceanographic Office (USA); Robert J. Carr, Univ. of Washington (USA); Kevin D. Henaey, Ocean Acoustical Services and Instrumentation Systems, Inc. (USA); Edward A. Holmberg, Univ. of New Orleans (USA); Andrea C. Mask, Bryan L. Mensi, Naval Oceanographic Office (USA) . . . . [9459-20]

Are the satellite-observed narrow, streaky chlorophyll filaments locally intensified by the submesoscale processes?, Igor Shulman, Bradley Penta, James G. Richman, Gregg Jacobs, Stephanie Anderson, Peter Sakalaukus, U.S. Naval Research Lab. (USA) . . . . [9459-21]

Factors affecting radiometric calibration of ocean color satellite sensors using AERONET-OC data, Samir Ahmed, Vincius De Paula, Alexander Gilerson, The City College of New York (USA); Menghua Wang, NOAA National Environmental Satellite, Data, and Information Service (USA); Robert A. Arnone, The Univ. of Southern Mississippi (USA) . . . . [9459-22]

Bio-optical model of remote sensing signals in a stratified ocean, James H. Churnside, National Oceanic and Atmospheric Administration (USA) . . . . [9459-23]

Ocean and polarization observations from active remote sensing: atmospheric and ocean science applications, Damien B. Josset, Weilin W. Hou, U.S. Naval Research Lab. (USA); Jacques R. Pelon, Univ. Pierre et Marie Curie (France); Yongxiang Hu, NASA Langley Research Ctr. (USA); Simone Tanelli, Jet Propulsion Lab. (USA); Richard Ferrare, Sharon P. Burton, NASA Langley Research Ctr. (USA); Nicolas Pascal, Univ. des Sciences et Technologies de Lille (France) . . . . [9459-24]

Real-time ship monitoring system for offshore maritime surveillance in South Korea, Chan-Su Yang, Korea Institute of Ocean Science & Technology (Korea, Republic of) . . . . [9459-25]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:30 AM TO 1:30 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 6 . . . . WED 1:30 PM TO 3:10 PM

Sea Surface Temperature Remote Sensing I

Session Chair: **Alexander Ignatov,** NOAA National Environmental Satellite, Data, and Information Service (USA)

Ocean thermal fronts detection in the full thermal IR imagery, Irina Gladkova, The City College of New York (USA) and NOAA-CREST (USA); Fazlul Shahriar, The City College of New York (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA); Yury Kihai, NOAA National Environmental Satellite, Data, and Information Service (USA) and GST, Inc. (USA) . . . . [9459-26]

A fast, robust, adaptive destriping algorithm for SNPP VIIRS and Terra/Aqua MODIS SST, Karlis Mikelsons, GST, Inc. (USA) and NOAA National Environmental Satellite, Data, and Information Service (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA); Marouan Bouali, Univ. de São Paulo (Brazil); Yury Kihai, GST, Inc. (USA) and NOAA National Environmental Satellite, Data, and Information Service (USA) . . . . [9459-27]

Evaluation of VIIRS SST fields through the analysis of overlap regions between consecutive orbits, Jean-François P. Cayula, Vencore, Inc. (USA) . . . . [9459-28]

Seasonal trends of ocean SST products characterized by the differences in orbital overlaps for waters types, Robert A. Arnone, Ryan A. Vandermeulen, The Univ. of Southern Mississippi (USA); Jean-François P. Cayula, Vencore, Inc. (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA) . . . . [9459-29]

Suppressing the noise in SST retrieved from satellite infrared measurements by smoothing the differential terms in regression equations, Boris Petrenko, NOAA National Environmental Satellite, Data, and Information Service (USA) and GST, Inc. (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA); Yury Kihai, NOAA National Environmental Satellite, Data, and Information Service (USA) and GST, Inc. (USA) . . . . [9459-30]

SESSION 7 . . . . WED 3:40 PM TO 5:40 PM

Sea Surface Temperature Remote Sensing II

Session Chairs: **Robert A. Arnone,** The Univ. of Southern Mississippi (USA); **Jean-François Paul Cayula,** Vencore, Inc. (USA)

VIIRS SST products and monitoring at NOAA, Alexander Ignatov, John Stroup, Yury Kihai, Boris Petrenko, Irina Gladkova, Prasanjit Dash, Xingming Liang, Feng Xu, Xinjia Zhou, Karlis Mikelsons, John Sapper, NOAA National Environmental Satellite, Data, and Information Service (USA) . [9459-31]

Monitoring and validation of AVHRR FRAC, MODIS, (A)ATSR and VIIRS high-resolution sea surface temperatures, Prasanjit Dash, Alexander Ignatov, Yury Kihai, John Stroup, Boris Petrenko, John Sapper, NOAA National Environmental Satellite, Data, and Information Service (USA) . . . . [9459-32]

Assimilation of ECMWF versus GFS profiles in fast CRTM for SST retrievals at NOAA, Xingming Liang, NOAA National Environmental Satellite, Data, and Information Service (USA) and Colorado State Univ. (USA) and Cooperative Institute for Research in the Atmosphere (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA) . [9459-33]

A new deterministic inversion technique for sea surface temperature retrieval from MODIS radiances, Prabhat K. Koner, Andrew R. Harris, The Univ. of Maryland (USA) . . . . [9459-34]

Long-term analysis of AVHRR calibration in thermal IR channels, Kai He, GST, Inc. (USA) and NOAA National Environmental Satellite, Data, and Information Service (USA); Alexander Ignatov, NOAA National Environmental Satellite, Data, and Information Service (USA); Yury Kihai, GST, Inc. (USA) and NOAA National Environmental Satellite, Data, and Information Service (USA); Xingming Liang, NOAA National Environmental Satellite, Data, and Information Service (USA) and Colorado State Univ. (USA); Changyong Cao, NOAA National Environmental Satellite, Data, and Information Service (USA); John Stroup, NOAA National Environmental Satellite, Data, and Information Service (USA) and Stinger Ghaffarian Technologies (USA) . . . . [9459-35]

A statistical methodology to identify stable/instable areas from remote sensing and numerical ocean models, Jesus Loeches, STO-CMRE (Italy); Raul Vicen, North Atlantic Treaty Organization (Italy) and STO-CMRE (Italy); Giuliana Pennucci, Aniello Russo, STO-CMRE (Italy) . . . . [9459-36]

CONFERENCE 9460

Monday–Tuesday 20–21 April 2015 • Part of Proceedings of SPIE Vol. 9460

Airborne Intelligence, Surveillance, Reconnaissance (ISR) Systems and Applications XII

Conference Chair: **Daniel J. Henry,** Rockwell Collins, Inc. (USA)

Conference Co-Chairs: **Gregory J. Gosian,** L-3 Communications (USA); **Davis A. Lange,** UTC Aerospace Systems (USA); **Dale Linne von Berg,** U.S. Naval Research Lab. (USA); **Thomas J. Walls,** U.S. Naval Research Lab. (USA); **Darrell L. Young,** Raytheon Intelligence & Information Systems (USA)

Monday 20 April

SESSION 1. . . . . .MON 9:00 AM TO 10:00 AM

ISR: Vision, Mission, and Tactics

Session Chair: **Dale Linne von Berg,** U.S. Naval Research Lab. (USA)

Reconnaissance architecture in near space, Eren O. Dundar, Harp Akademileri Komutanlığı (Turkey) . . . . [9460-1]

Hybrid consensus UAV formation control, Haci Mehmet Guzey, Missouri Univ. of Science and Technology (USA); Travis A. Dierks, DRS Sustainment Systems, Inc. (USA); Jagannathan Sarangapani, Missouri Univ. of Science and Technology (USA) . . . . [9460-2]

Design of a disguised miniature unmanned aerial vehicle (UAV) system with surveillance function, Terence K. L. Goh, Donny Ng, Ian V. H. Tam, SIM Univ. (Singapore) . . . . [9460-3]

SESSION 2 . . . . MON 10:30 AM TO 12:10 PM

ISR: Passive and Active Sensing

Session Chair: **Thomas J. Walls,** U.S. Naval Research Lab. (USA)

IR CMOS: an ISR solution for Nightvision and See Spot, Martin U. Pralle, James E. Carey, Chris J. Vineis, SiOnyx Inc. (USA) . . . . [9460-4]

Results from an experiment that collected visible-light polarization data using unresolved imagery for classification of geosynchronous satellites, Andy Speicher, Mohammad A. Matin, Univ. of Denver (USA); Francis K. Chun, Roger D. Tippets, U.S. Air Force Academy (USA). . . . . [9460-5]

Laser links for mobile airborne nodes, Wolfgang Griethe, G2Aerospace GmbH (Germany); Markus Knapek, Joachin Horwath, ViaLight Communications GmbH (Germany). . . . . [9460-6]

Small SWAP 3D flash ladar for small tactical unmanned air systems, Alan W. Bird, Scott A. Anderson, Michael D. Wojcik, Scott E. Budge, Utah State Univ. (USA) . . . . [9460-7]

EM modeling of far-field radiation patterns for antennas on the GMA-TT UAV, Anne I Mackenzie, NASA Langley Research Center (USA) . . . . [9460-8]

Lunch Break . . . . .Mon 12:10 pm to 1:40 pm

SESSION 3 . . . . .MON 1:40 PM TO 3:00 PM

ISR: Image Fusion/Enhancement

Session Chair: **Davis A. Lange,** UTC Aerospace Systems (USA)

Fusion of infrared and optical aerial images, Ali E. Destegül, Turkish Armed Forces (Turkey) . . . . [9460-9]

Fusion of video and radar comparison to 3D ladar for activity recognition, David Tahmoush, U.S. Army Research Lab. (USA). . . . . [9460-10]

Real-time embedded technology for enhancing long-range imagery, Aaron L. Paolini, Daniel L. Hertenstein, EM Photonics, Inc. (USA) and EM Photonics, Inc. (USA); Eric J. Kelmelis, James Bonnett, Paul A. Fox, EM Photonics, Inc. (USA) . . . . [9460-11]

Characterization of UAV hover patterns in support of superresolution research, Jeremy Straub, Ronald Marsh, Univ. of North Dakota (USA). [9460-12]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 4 . . . . TUE 8:20 AM TO 9:20 AM

ISR: Image Processing and Tracking

Session Chair: **Gregory J. Gosian,** L-3 Communications (USA)

Aerial video mosaicking using binary feature tracking, Breton L. Minnehan, Andreas E. Savakis, Rochester Institute of Technology (USA) . . . . [9460-13]

Background image understanding and adaptive imaging for vehicle tracking, Anthony Vodacek, Matthew J. Hoffman, Burak Uzkent, Bin Chen, Rochester Institute of Technology (USA) . . . . [9460-14]

Enhanced performance for the interacting multiple model estimator with integrated multiple filters, Madeleine G. Sabordo, Elias Aboutanios, The Univ. of New South Wales (Australia) . . . . [9460-15]

SESSION 5 . . . . .TUE 9:20 AM TO 10:00 AM

ISR: Change Detection

Session Chair: **Gregory J. Gosian,** L-3 Communications (USA)

Improving change detection results with knowledge of registration uncertainty, Andrew J. Lingg, Etegent Technologies, Ltd. (USA); Brian D. Rigling, Wright State Univ. (USA) . . . . [9460-16]

Change detection on UGV patrols with respect to a reference tour using VIS imagery, Thomas Müller, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany). . . . . [9460-17]

CONFERENCE 9460

SESSION 6 . . . . TUE 10:30 AM TO 11:10 AM

ISR: Exploitation

Session Chair: **Darrell L. Young,**
Raytheon Intelligence & Information Systems (USA)

Pressing the sparsity advantage via data-based decomposition, Vahid R. Riasati, Raytheon Space & Airborne Systems (USA) . . . . [9460-18]

Orthomosaic construction and analysis of EO imagery from a small unmanned aircraft system (SUAS) for natural resources management on an active military training range, Leslie Bolick, Nicholas C. Stroumtsos, Dawn Lawson, Kimberly O'Connor, SPAWAR Systems Ctr. (USA) . . . . [9460-19]

SESSION 7 . . . . TUE 11:10 AM TO 12:10 PM

ISR: Image Sequences/Full Motion Video

Session Chair: **Darrell L. Young,**
Raytheon Intelligence & Information Systems (USA)

Image sequence exploitation for mobile operations, Markus Mueller, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany); Stella Oldenbuerger, Bundeswehr Technical Ctr. for Information Technology and Electronics (Germany) . . . . [9460-20]

Context and quality estimation in video for enhanced event detection, John M. Irvine, Richard J. Wood, Draper Lab. (USA). [9460-21]

Automated FMV image quality assessment based on power spectrum statistics, Andrew R. Kalukin, NGA/IID (USA) . . . . [9460-22]

SEE WEB FOR UPDATES

CONFERENCE 9461A

Monday–Wednesday 20–22 April 2015 • Part of Proceedings of SPIE Vol. 9461

Radar Sensor Technology XIX

Conference Chairs: **Kenneth I. Ranney,** U.S. Army Research Lab. (USA); **Armin Doerry,** Sandia National Labs. (USA)

Program Committee: **Fauzia Ahmad,** Villanova Univ. (USA); **Moeness G. Amin,** Villanova Univ. (USA); **Joseph C. Deroba,** U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); **Mark Govoni,** U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); **Majeed Hayat,** The Univ. of New Mexico (USA); **Chandra Kambhamettu,** Univ. of Delaware (USA); **Seong-Hwoon Kim,** Raytheon Space & Airborne Systems (USA); **James L. Kurtz,** Univ. of Florida (USA); **Changzhi Li,** Texas Tech Univ. (USA); **Jenshan Lin,** Univ. of Florida (USA); **Hao Ling,** The Univ. of Texas at Austin (USA); **David G. Long,** Brigham Young Univ. (USA); **Jia-Jih Lu,** General Atomics Aeronautical Systems, Inc. (USA); **Neeraj Magotra,** Western New England Univ. (USA); **Anthony F. Martone,** U.S. Army Research Lab. (USA); **Gregory J. Mazzaro,** The Citadel (USA); **George J. Moussally,** Mirage Systems (USA); **Ram M. Narayanan,** The Pennsylvania State Univ. (USA); **Lam H. Nguyen,** U.S. Army Research Lab. (USA); **Hector A. Ochoa,** The Univ. of Texas at Tyler (USA); **Zhijun G. Qiao,** The Univ. of Texas-Pan American (USA); **Ann M. Raynal,** Sandia National Labs. (USA); **Jerry Silvious,** U.S. Army Research Lab. (USA); **Brian Smith,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Helmut Suess,** Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany); **David Tahmoush,** U.S. Army Research Lab. (USA); **Russell Vela,** Air Force Research Lab. (USA); **Berenice Verdin,** The Univ. of Texas at El Paso (USA); **Frank Yakos,** SELEX Galileo, Inc. (USA); **Yan Zhang,** The Univ. of Oklahoma (USA)

MONDAY 20 APRIL

OPENING REMARKS . . . . 8:20 AM TO 8:30 AM

Session Chairs: **Armin W. Doerry,** Sandia National Labs. (USA); **Kenneth I. Ranney,** U.S. Army Research Lab. (USA)

SESSION 1. . . . . MON 8:30 AM TO 10:30 AM

Components and Technologies

Session Chair: **Ann M. Raynal,** Sandia National Labs. (USA)

Calculation of the phase-center offset from 2D antenna radiation patterns, Patrick S. Deboux, Berenice Verdin, U.S. Army Research Lab. (USA); Samuel A. Pichardo, The Univ. of Texas at El Paso (USA). . . . . [9461-1]

Characterization of radar cross section of carbon-fiber composite materials, Elliot J. Riley, Erik H. Lenzing, Ram M. Narayanan, The Pennsylvania State Univ. (USA). . . . . [9461-2]

Design considerations for eye-safe single-aperture laser radars, Dmitry S. Starodubov, Torrey Pines Logic, Inc. (USA) . . . . [9461-3]

Deployment of rare Earth elements (REEs) on RF sources, lasers, and EO/IR sensors, Asu R. Jha, JHA Technical Consulting Services (USA) . [9461-4]

System-on-chip architecture and validation for real-time transceiver optimization, Hernan Suarez, Yan Zhang, The Univ. of Oklahoma (USA) . . . . [9461-5]

Acceleration of generalized adaptive pulse compression with parallel GPUs, Jingxiao Cai, Yan R. Zhang, The Univ. of Oklahoma (USA) . . . . . [9461-6]

SESSION 2 . . . . MON 11:00 AM TO 12:20 PM

Non-Linear and Cognitive Radar

Session Chairs: **Gregory J. Mazzaro,** The Citadel (USA); **Anthony F. Martone,** U.S. Army Research Lab. (USA)

Short-range harmonic radar: chirp waveform, electronic targets, Gregory J. Mazzaro, The Citadel (USA); Kyle A. Gallagher, The Pennsylvania State Univ. (USA); Anthony F. Martone, Kelly D. Sherbondy, U.S. Army Research Lab. (USA); Ram M. Narayanan, The Pennsylvania State Univ. (USA) . . . . [9461-7]

Nonlinear synthetic aperture radar imaging using a harmonic radar, Kyle A. Gallagher, The Pennsylvania State Univ. (USA); Gregory J. Mazzaro, The Citadel (USA); Kenneth I. Ranney, Lam H. Nguyen, Anthony F. Martone, Kelly D. Sherbondy, U.S. Army Research Lab. (USA); Ram M. Narayanan, The Pennsylvania State Univ. (USA). . . . . [9461-8]

Filter selection for a harmonic radar receiver, Kyle A. Gallagher, The Pennsylvania State Univ. (USA); Gregory J. Mazzaro, The Citadel (USA); Anthony F. Martone, Kelly D. Sherbondy, U.S. Army Research Lab. (USA); Ram M. Narayanan, The Pennsylvania State Univ. (USA). . . . . [9461-9]

Sparse SAR imaging for stepped frequency nonlinear radar, Lam H. Nguyen, U.S. Army Research Lab. (USA); Kyle A. Gallagher, The Pennsylvania State Univ. (USA); Kenneth I. Ranney, U.S. Army Research Lab. (USA) . . . . [9461-10]

Lunch Break . . . . .Mon 12:20 pm to 1:30 pm

SESSION 3 . . . . MON 1:30 PM TO 3:10 PM

Algorithms and Phenomenology I

Session Chair: **Mark A. Govoni,** U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA)

Terrain clutter simulation using physics-based scattering model and digital terrain profile data, James Park, Air Force Research Lab. (USA); Joel T. Johnson, The Ohio State Univ. (USA); Kung-Hau Ding, Kristopher Kim, Joseph Tenbarge, Air Force Research Lab. (USA) . . . . [9461-11]

Radar-centric scattering of possible targets for orbital debris remediation, Russell Vela, James Park, Brian M. Kent, Air Force Research Lab. (USA); Anthony Griffith, Rebecca Johanning, Kenneth Baker, Peter Spehar, NASA Johnson Space Ctr. (USA) . . . . [9461-12]

The Born approximation, multiple scattering, and algorithm, Alejandro F. Martinez, Zhijun G. Qiao, The Univ. of Texas-Pan American (USA) . . . . [9461-13]

Building detection in SAR imagery, Ryan M. Steinbach, Mark W. Koch, Mary M. Moya, Jeremy Goold, Sandia National Labs. (USA). . . . . [9461-14]

Automatic segmentation of ice layers in radar images, Maryam Rahnemoonfar, Texas A&M Univ. Corpus Christi (USA) . . . . [9461-15]

SESSION 4 . . . . MON 3:40 PM TO 4:40 PM

Indoor/Urban Target Detection, Localization, and Tracking

Session Chair: **Fauzia Ahmad,** Villanova Univ. (USA)

Bistatic and multistatic target identification for through-wall radar imaging, Joshua M. Allebach, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Benjamin Hoe, DSCI (USA); Sean P. Broderick, U.S. Army RDECOM CERDEC NVESD (USA). . . . . [9461-16]

Fall detection and classification though walls and in heavy indoor clutter, Moeness G. Amin, Fauzia Ahmad, Villanova Univ. (USA) . . . . [9461-17]

RCS information theoretic approach for target classification, Travis D. Bufler, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Traian V. Dogaru, U.S. Army Research Lab. (USA) . . . . [9461-18]

TUESDAY 21 APRIL

SESSION 5 . . . . TUE 8:00 AM TO 10:00 AM

Programs and Applications

Session Chairs: **Jerry L. Silvious,** U.S. Army Research Lab. (USA); **Seong-Hwoon Kim,** Raytheon Space & Airborne Systems (USA)

Performance analysis of spectrally versatile forward-looking ground-penetrating radar for detection of concealed targets, Brian R. Phelan, The Pennsylvania State Univ. (USA); Marc A. Ressler, Kenneth I. Ranney, Gregory D. Smith, Getachew A. Kirose, Kelly D. Sherbondy, U.S. Army Research Lab. (USA); Ram M. Narayanan, The Pennsylvania State Univ. (USA) . . . . . . [9461-19]

FlexSAR: demonstrating high-quality, cost-effective multimodal radar system prototyping, Mark D. Jensen, Chad Knight, Space Dynamics Lab. (USA) . . . . [9461-20]

Recent experiments using the ARL Rail-SAR, Kenneth I. Ranney, U.S. Army Research Lab. (USA); Brian R. Phelan, The Pennsylvania State Univ. (USA); Getachew A. Kirose, Kelly D. Sherbondy, U.S. Army Research Lab. (USA) . . . . [9461-21]

Technology integration and synergies: radar, optics, and AIS, Hasan Shahid, Stevens Institute of Technology (USA); Joe Nathan Abellard, New York City College of Technology (USA); Yong-Qi Chen, Stevens Institute of Technology (USA); David M. González Chévere, Univ. de Puerto Rico Mayagüez (USA) . . . . [9461-22]

Radom effects on coherent change detection radar systems, Ann M. Raynal, Dale F. Dubbert, Bryan L. Burns, William H. Hensley Jr., Sandia National Labs. (USA) . . . . [9461-23]

SAR-based vibrometry using the fractional Fourier transform, Majeed M. Hayat, The Univ. of New Mexico (USA); Tom D. Atwood, Sandia National Labs. (USA); Justin B. Campbell, Jelili Ade-bello, Ishwor Bhatta, Humberto Caudana, Nicole B. Trujillo, Balu Santhanam, Walter H. Gerstle, The Univ. of New Mexico (USA); Armin W. Doerry, Sandia National Labs. (USA) . . . . [9461-24]

SESSION 6 . . . . TUE 10:30 AM TO 12:10 PM

Algorithms and Phenomenology

Session Chair: **Lam H. Nguyen,** U.S. Army Research Lab. (USA)

An algorithm for segmenting polarimetric SAR imagery, Jorge V. Geaga, Consultant (USA) . . . . [9461-25]

Generalization of susceptibility of RF systems through far-field pattern superposition, Berenice Verdin, Patrick S. Debroux, U.S. Army Research Lab. (USA) . . . . [9461-26]

A practical look at target detection using MIMO radar, Mark A. Govoni, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); Jeffrey Spak, U.S. Army Communications-Electronics Research Development and Engineering Command (USA); Traian V. Dogaru, DaHan Liao, U.S. Army Research Lab. (USA) . . . . [9461-27]

Sensor fusion in RF tomography of stationary objects in free space: preliminary results, Jia Li, Oakland Univ. (USA); Robert L. Ewing, Charles Berdanier, Air Force Research Lab. (USA); Chris J. Baker, The Ohio State Univ. (USA) . . . . [9461-28]

Application of equalization notch to improve synthetic aperture radar coherent data products, Cameron Musgrove, Sandia National Labs. (USA); James C. West, Oklahoma State Univ. (USA) . . . . [9461-29]

Lunch/Exhibition Break . . . . Tue 12:10 pm to 1:20 pm

SESSION 7 . . . . TUE 1:20 PM TO 3:00 PM

Noise and LPI Radar I

Session Chair: **Yan Rockee Zhang,** The Univ. of Oklahoma (USA)

Radar cross-sectional study using noise radar, Al Freundorfer, Queen's Univ. (Canada); Jawad Y. Siddiqui, Yahia M. Antar, Royal Military College of Canada (Canada) . . . . [9461-30]

Principle and experimental results of ultra-wideband noise radar imaging of a cylindrical conducting object using diffraction tomography, Hee Jung Shin, Mark A. Asmuth, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Muralidhar Rangaswamy, Air Force Research Lab. (USA) . . . . [9461-31]

Design and implementation of a noise radar tomographic system, Mark A. Asmuth, Hee Jung Shin, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Muralidhar Rangaswamy, Air Force Research Lab. (USA) . [9461-32]

Efficient pulse compression for LPI waveforms based on a nonparametric iterative adaptive approach, Zhengzheng Li, The Univ. of Oklahoma (USA); Shang Wang, RFMD (USA); Yan Zhang, The Univ. of Oklahoma (USA) . [9461-33]

Probability of target detection using advanced pulse compression noise (APCN), Mark A. Govoni, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); Ryan A. Elwell, U.S. Army Communications-Electronics Research Development and Engineering Command (USA); Traian V. Dogaru, DaHan Liao, U.S. Army Research Lab. (USA) . . . . [9461-34]

SESSION 8 . . . . TUE 3:30 PM TO 4:10 PM

Noise and LPI Radar II

Session Chair: **Mark A. Govoni,** U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA)

Analysis of chaotic system synchronization for bistatic radar, Chandra S. Pappu, The Univ. of Texas at El Paso (USA); Berenice Verdin, U.S. Army Research Lab. (USA); Benjamin C. Flores, The Univ. of Texas at El Paso (USA); James Boehm, Patrick S. Debroux, U.S. Army Research Lab. (USA) . . [9461-35]

The implementation of compressive sensing on an FPGA for chaotic radars, Hector A. Ochoa, The Univ. of Texas at Tyler (USA); David H. Hoe, Loyola Univ. Maryland (USA); Dinesh Veeramachaneni, The Univ. of Texas at Tyler (USA). . . . . [9461-36]

SESSION 9 . . . . TUE 4:10 PM TO 5:50 PM

Quantum Radar

Session Chair: **Marco O. Lanzagorta,** U.S. Naval Research Lab. (USA)

Range detection using entangled optical photons, Matthew J. Brandsema, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Marco O. Lanzagorta, U.S. Naval Research Lab. (USA) . . . . [9461-37]

Algorithmic analysis of quantum radar sidelobes, Salvador E. Venegas-Andraca, Tecnológico de Monterrey (Mexico); Marco O. Lanzagorta, U.S. Naval Research Lab. (USA) . . . . [9461-38]

Low-brightness quantum radar, Marco O. Lanzagorta, U.S. Naval Research Lab. (USA) . . . . [9461-39]

Quantum error reduction without coding, Keye Martin, U.S. Naval Research Lab. (USA) . . . . [9461-40]

Space-based quantum sensing for detection of small targets, Jeffrey K. Uhlmann, George Mason Univ. (USA); Marco O. Lanzagorta, U.S. Naval Research Lab. (USA) . . . . [9461-41]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. . . . . TUE 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Spurious effects of analog-to-digital conversion nonlinearities on radar range-Doppler maps, Armin W. Doerry, Dale F. Dubbert, Bert L. Tise, Sandia National Labs. (USA) . . . . [9461-49]

Balancing radar receiver channels with commutation, Armin W. Doerry, Sandia National Labs. (USA) . . . . [9461-50]

Comments on radar interference sources and mitigation techniques, Armin W. Doerry, Sandia National Labs. (USA) . . . . [9461-51]

Balancing I/Q data in radar range-Doppler images, Armin W. Doerry, Sandia National Labs. (USA) . . . . [9461-52]

Joint estimation of thermal and multiplicative noise levels in dual- and quad-polarization SAR images, Robert Riley, Sandia National Labs. (USA) . . . . [9461-53]

Experimental evaluation of single-aperture range finder, Kyle McCormick, Dmitry S. Starodubov, Leo Volfson, Torrey Pines Logic, Inc. (USA) . . . . [9461-54]

Coherence model for building layover in interferometric SAR, Douglas L Bickel, Sandia National Labs. (USA) . . . . [9461-55]

WEDNESDAY 22 APRIL

SESSION 10 . . . . WED 9:00 AM TO 10:20 AM

Medical Applications of Radar

Session Chair: **Ram M. Narayanan,** The Pennsylvania State Univ. (USA)

Investigations on the effect of frequency and noise in a localization technique based on microwave imaging for an in-body RF-source, Rohit Chandra, Norwegian Univ. of Science and Technology (Norway); Ilangko Balasingham, Norwegian Univ. of Science and Technology (Norway) and Oslo Univ. Hospital (Norway) . . . . [9461-42]

A new microwave imaging algorithm based on third-generation WCE system, Huiyuan Zhou, The Pennsylvania State Univ. (USA); Rohit Chandra, Norwegian Univ. of Science and Technology (Norway); Ilangko Balasingham, Oslo Univ. Hospital (Norway); Ram M. Narayanan, The Pennsylvania State Univ. (USA) . . . . [9461-43]

Investigating signatures of diverse waveforms to assess changes in thickness and dielectric properties of intestines afflicted with Crohn's disease, Sonny Smith, Ram M. Narayanan, The Pennsylvania State Univ. (USA); Evangelos Messaris, Penn State Milton S. Hershey Medical Ctr. (USA). [9461-44]

Radar sensitivity to human heartbeats and respiration, Øyvind Aardal, Sverre Brovoll, Yoann Paichard, Tor Berger, Norwegian Defence Research Establishment (Norway); Tor Sverre Lande, Univ. I Oslo (Norway); Svein-Erik Hamran, Norwegian Defence Research Establishment (Norway) and Univ. I Oslo (Norway) . . . . [9461-45]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:20 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 11. . . . . .WED 1:00 PM TO 3:20 PM

Radar Micro-Doppler

Joint Session with Conferences 9461A and 9461B

Session Chair: **David Tahmoush,** U.S. Army Research Lab. (USA)

Micro-Doppler characteristics of elderly gait patterns with walking aids, Moeness G. Amin, Yimin D. Zhang, Fauzia Ahmad, Villanova Univ. (USA) . . . . [9461-46]

Fall detection and classification using high-resolution time-frequency distributions, Moeness G. Amin, Villanova Univ. (USA); Boualem Boashash, Qatar Univ. (Qatar); Yimin D. Zhang, Villanova Univ. (USA) . . . . [9461-47]

The effectiveness of a staring 3D surveillance system against mitigating wind farm clutter, Mohammed Jahangir, Gordon K. A. Oswald, Max Halbert, Peter Wurmsdobler, Tim Quilter, Aveillant Ltd. (United Kingdom) . . . . . [9461-48]

Human activity classification using time-frequency image analysis of micro-Doppler signatures, Matthew Zenaldin, Ram M. Narayanan, The Pennsylvania State Univ. (USA). . . . . [9461-56]

Study of the micro-Doppler signature of a bicyclist for different directions of approach, Berta Rodriguez-Hervas, The Univ. of Texas at El Paso (USA); Michael Maile, Mercedes-Benz Research & Development North America, Inc. (USA); Benjamin C. Flores, The Univ. of Texas at El Paso (USA) . . . . . . [9461-57]

Extracting and analyzing micro-Doppler from ladar signatures, David Tahmoush, U.S. Army Research Lab. (USA). . . . . [9461-58]

High Range Resolution Micro-Doppler Analysis, Graeme E Smith, Zach Cammenga, Christopher J Baker, The Ohio State University (USA) . . . . [9461-59]

CONFERENCE 9461B

Thursday 23 April 2015 • Part of Proceedings of SPIE Vol. 9461

Active and Passive Signatures VI

Conference Chairs: **G. Charmaine Gilbreath,** U.S. Naval Research Lab. (USA); **Chadwick Todd Hawley,** Senior Expert for Signatures (USA)

Program Committee: **David W. Allen,** National Institute of Standards and Technology (USA); **Kelly W. Bennett,** U.S. Army Research Lab. (USA); **Carlos Omar Font,** U.S. Naval Research Lab. (USA); **Marco O. Lanzagorta,** U.S. Naval Research Lab. (USA); **Ram M. Narayanan,** The Pennsylvania State Univ. (USA); **Frank Pipitone,** U.S. Naval Research Lab. (USA); **Robert Richardson,** U.S. Dept. of Defense Intelligence Information Systems (USA); **Carl Salvaggio,** Rochester Institute of Technology (USA); **Fred Schnarre,** National Geospatial-Intelligence Agency (USA); **David N. Strafford,** Soter Technology (USA)

WEDNESDAY 22 APRIL

SESSION 1. . . . . .WED 1:00 PM TO 3:20 PM

Radar Micro-Doppler

Joint Session with Conferences 9461A and 9461B

Session Chair: **David Tahmoush,** U.S. Army Research Lab. (USA)

Micro-Doppler characteristics of elderly gait patterns with walking aids, Moeness G. Amin, Yimin D. Zhang, Fauzia Ahmad, Villanova Univ. (USA) . . . . [9461-46]

Fall detection and classification using high-resolution time-frequency distributions, Moeness G. Amin, Villanova Univ. (USA); Boualem Boashash, Qatar Univ. (Qatar); Yimin D. Zhang, Villanova Univ. (USA) . . . . [9461-47]

The effectiveness of a staring 3D surveillance system against mitigating wind farm clutter, Mohammed Jahangir, Gordon K. A. Oswald, Max Halbert, Peter Wurmsdobler, Tim Quilter, Aveillant Ltd. (United Kingdom) . . . . . [9461-48]

Human activity classification using time-frequency image analysis of micro-Doppler signatures, Matthew Zenaldin, Ram M. Narayanan, The Pennsylvania State Univ. (USA). . . . . [9461-56]

Study of the micro-Doppler signature of a bicyclist for different directions of approach, Berta Rodriguez-Hervas, The Univ. of Texas at El Paso (USA); Michael Maile, Mercedes-Benz Research & Development North America, Inc. (USA); Benjamin C. Flores, The Univ. of Texas at El Paso (USA) . . . . . . [9461-57]

Extracting and analyzing micro-Doppler from ladar signatures, David Tahmoush, U.S. Army Research Lab. (USA). . . . . [9461-58]

High Range Resolution Micro-Doppler Analysis, Graeme E Smith, Zach Cammenga, Christopher J Baker, The Ohio State University (USA). . . . [9461-59]

THURSDAY 23 APRIL

SESSION 1. . . . . THU 8:30 AM TO 12:00 PM

Active and Passive Signatures I

Application of a laser Doppler vibrometer for air-water to subsurface signature detection, James Roeder, Phillip Land, Dennis J. Robinson, Arun K. Majumdar, Naval Air Warfare Ctr. Weapons Div. (USA) . . . . [9461-60]

Hyperspectral chemical agent standoff detection using sparse representation, Asif Mehmood, Booz Allen Hamilton Inc. (USA) . . . . . [9461-61]

Signature simulation of mixed materials, Tyler Carson, Rochester Institute of Technology (USA) . . . . [9461-62]

Enabling forest structure research with a cost-effective terrestrial LiDAR platform, Jason W. Faulring, Jan A. N. van Aardt, David Kelbe, Paul Romanczyk, Rochester Institute of Technology (USA); Francesco Peri, Crystal Schaff, Univ. of Massachusetts Boston (USA) . . . . [9461-63]

Electro-optical detection probability of optical devices determined by bidirectional laser retro-reflection cross section, Martin Laurenzis, Frank Christnacher, Alexis Matwyschuk, Emmanuel Bacher, Stephane Schertzer, Sebastien Hengy, Institut Franco-Allemand de Recherches de Saint-Louis (France) . . . . [9461-64]

Spectral reflectance variability of skin and attributing factors, Catherine C. Cooksey, Benjamin K. Tsai, David W. Allen, National Institute of Standards and Technology (USA) . . . . [9461-65]

Rugged target standards for HSI remote sensing, Mark Morey, John D. DiBenedetto, Mary O'Neill, National Security Technologies, LLC (USA) . . . . [9461-66]

Enhancing radar cross-section images of artificial targets using radar polarimetry, Thomas Dallmann, Dirk Heberling, RWTH Aachen Univ. (Germany) . . . . [9461-67]

Anomalous reflection of THz pulse containing a few cycles from absorbing layer: influence of absolute phase of the pulse on the medium response, Vyacheslav A. Trofimov, Mikhail V. Fedotova, Elena S. Komarova, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9461-68]

Lunch/Exhibition Break . . . . Thu 12:00 pm to 1:30 pm

SESSION 3 . . . . .THU 1:30 PM TO 2:50 PM

Active and Passive Signatures II

Applying composite signatures to rapidly detect and characterize, Chadwick T. Hawley, U.S. Dept. of Defense (USA) and Help Me Now, LLC (USA) . . . . [9461-69]

Real-time full-motion color FLASH LIDAR for target detection and identification, Roy D. Nelson, Jeremy Craner, Kurt von Niederhausern, Rex M. Craig, Eric Coppock, Ball Aerospace & Technologies Corp. (USA) . . . . [9461-70]

HySpecIQ: realizing the potential of hyperspectral remote sensing informatics in the age of data analytics, Joseph D. Fargnoli, HySpecIQ (USA) . . . . [9461-72]

QUILT: combining stereoscopy with lidar for precision 3D object characterization, G. Charmaine Gilbreath, Carlos Omar Font, David Bonanno, Blerta Bajramaj, Kristen Nock, U.S. Naval Research Lab. (USA) . . . . . . [9461-73

CONFERENCE 9462

Thursday 23 April 2015 • Proceedings of SPIE Vol. 9462

Passive and Active Millimeter-Wave Imaging XVIII

Conference Chairs: **David A. Wikner,** U.S. Army Research Lab. (USA); **Arttu R. Luukanen,** Asqella Corp. (Finland)

Program Committee: **Roger Appleby,** Queen's Univ. Belfast (United Kingdom); **Erich N. Grossman,** National Institute of Standards and Technology (USA); **Christopher A. Martin,** Trex Enterprises Corp. (USA); **Duncan A. Robertson,** Univ. of St. Andrews (United Kingdom); **Bruce Wallace,** Defense Advanced Research Projects Agency (USA)

Thursday 23 April

SESSION 1. . . . . THU 8:00 AM TO 10:00 AM

Systems I

A single pixel millimeter-wave imaging system based on metamaterials, Jiajun Bai, Yunqi Fu, Qiang Chen, Liang Chen, National Univ. of Defense Technology (China) . . . . [9462-1]

Optical and imaging performance testing for an improved real time passive millimetre-wave imager to be used in degraded visual environments, Colin D. Cameron, Rupert N. Anderton, Gordon N. Sinclair, James G. Burnett, Philip J. Kent, QinetiQ Ltd. (United Kingdom). . . . . [9462-2]

Design and operation of ACTPol: a millimeter wavelength, polarization sensitive receiver for the Atacama Cosmology Telescope, Benjamin L. Schmitt, Univ. of Pennsylvania (USA); ACTPol Collaboration, Princeton Univ. (USA) . . . . [9462-3]

Concealed object stand-off real-time imaging for security: CONSORTIS, Roger Appleby, InnovaSec Ltd. (United Kingdom); Stuart Ferguson, Queen's Univ. Belfast (United Kingdom); Henrik Petersson, Swedish Defence Research Agency (Sweden). . . . . [9462-4]

A real time stand-off submillimetre-wave quasi-optical imaging system with large field of view, Erio Gandini, Nuria Llombart, Technische Univ. Delft (Netherlands) . . . . [9462-5]

Noise analysis for near-field 3D FM-CW radar imaging systems, David M. Sheen, Pacific Northwest National Lab. (USA) . . . . [9462-6]

SESSION 2 . . . . THU 10:30 AM TO 11:50 AM

Systems II

Millimeter-wave imaging at up to 40 frames per second using an optoelectronic photo-injected Fresnel zone plate lens antenna at (sub-) mmw frequencies, Thomas F. Gallacher, Aalto Univ. School of Science and Technology (Finland); David G. Macfarlane, Univ. of St. Andrews (United Kingdom); Rune Søndenå, Institute for Energy Technology (Norway); Duncan A. Robertson, Graham M. Smith, Univ. of St. Andrews (United Kingdom) . . [9462-7]

Characteristics and performance of a commercial multiband passive submillimetre-wave video camera, Arttu R. Luukanen, Asqella Oy (Finland); Juha Ala-Laurinaho, Aalto Univ. School of Electrical Engineering (Finland); Alex Kokka, Mikko M. Leivo, Asqella Oy (Finland); Aleksi A. Tamminen, Aalto Univ. School of Electrical Engineering (Finland); Antti V. Räisänen, Aalto Univ. School of Science and Technology (Finland) . . . . [9462-8]

Video rate passive millimeter-wave imager utilizing optical upconversion with improved size, weight, and power, Richard D. Martin, Christopher A. Schuetz, Thomas E. Dillon, Daniel G. Mackrides, Phase Sensitive Innovations, Inc. (USA); Dennis W. Prather, Shouyuan Shi, Univ. of Delaware (USA); Peng Yao, Phase Sensitive Innovations, Inc. (USA); Kevin Shreve, Univ. of Delaware (USA) . . . . [9462-9]

Optical-network-connected multi-channel 96-GHz-band distributed radar system, Atsushi Kanno, Toshiaki Kuri, Tetsuya Kawanishi, National Institute of Information and Communications Technology (Japan). . . . . [9462-10]

Lunch Break . . . . Thu 11:50 am to 1:20 pm

SESSION 3 . . . . THU 1:20 PM TO 2:00 PM

Systems III

Some opinion about matrix terahertz imaging system based on Josephson junctions, Alexander Denisov, Harbin Institute of Technology (China) . . . . [9462-11]

Multiplexable sub-mm detector arrays for radiometric imaging, Juha Hassel, Andrey V. Timofeev, Visa Vesterinen, Hannu Sipola, Panu Helistö, Leif Grönberg, VTT Technical Research Ctr. of Finland (Finland); Arttu R. Luukanen, Asqella Oy (Finland). . . . . [9462-12]

SESSION 4 . . . . THU 2:00 PM TO 4:30 PM

Phenomenology

Toward the development of an image quality tool for the testing of active millimeter-wave imaging systems, Jeffrey Barber, James C. Weatherall, Joseph Greca, Battelle Memorial Institute (USA); Barry T. Smith, U.S. Dept. of Homeland Security (USA) . . . . [9462-13]

Simulations and image validation for 350 GHz passive imaging systems, Daniel T. Becker, National Institute of Standards and Technology (USA); Peter A. R. Ade, Cardiff Univ. (United Kingdom); James A. Beall, National Institute of Standards and Technology (USA); Hsiao-Mei Cho, Stanford Univ. (USA); Simon R. Dicker, Univ. of Pennsylvania (USA); William D. Duncan, National Institute of Standards and Technology (USA); Mark Halpern, The Univ. of British Columbia (Canada); Gene C. Hilton, National Institute of Standards and Technology (USA); Kent D. Irwin, Stanford Univ. (USA); Nicholas G. Paulter Jr., Robert E. Schwall, Carl D. Reintsema, National Institute of Standards and Technology (USA); Carole E. Tucker, Cardiff Univ. (United Kingdom). . . . . [9462-14]

Spectral signatures for identifying explosives with wide-band millimeter-wave illumination, James C. Weatherall, Jeffrey Barber, Battelle Memorial Institute (USA); Barry T. Smith, U.S. Dept. of Homeland Security (USA) [9462-15]

Summary and analysis of 216 GHz polarimetric measurements of in-situ rain, Abigail S. Hedden, David A. Wikner, Russell Bradley, U.S. Army Research Lab. (USA) . . . . [9462-16]

Electromagnetic scattering from metallic and dielectric surfaces at millimeter-wave and terahertz frequencies, David A. DiGiovanni, Andrew J. Gatesman, Robert H. Giles, Univ. of Massachusetts Lowell (USA); Williams E. Nixon, National Ground Intelligence Ctr. (USA). [9462-17]

Beyond the Kirchoff approximation: quantitative studies of submillimeter rough surface scattering, Erich N. Grossman, Richard A. Chamberlin, Josh Gordon, Natalie Mujica-Schwahn, National Institute of Standards and Technology (USA) . . . . [9462-18]

CONFERENCE 9462

SESSION 5 . . . . THU 4:30 PM TO 5:30 PM

Image Processing

Automatic detection of hidden threats in the TeraSCREEN passive millimeter-wave imaging subsystem, Satish Madhogaria, Marek Schikora, Fraunhofer FKIE (Germany) . . . . [9462-19]

Feasibility of radon imaging reconstruction in the MMW region using very inexpensive plasma GDD lamps with new video rate 16x16 FPA camera, Assaf Levanon III, Ben-Gurion Univ. of the Negev (Israel); Michael Konstantinovsky II, Ben-Gurion Univ. of the Negev (Israel) and Intel Corp. (USA); Yitzhak Yitzhaky, Adrian Stern, Natan S. Kopeika, Ben-Gurion Univ. of the Negev (Israel); Amir Abramovich, Ariel Univ. (Israel) . . . . [9462-20]

Real-time image processing for passive mmW imagery, Stephen T. Kozacik, Univ. of Delaware (USA) and EM Photonics, Inc. (USA); James Bonnett, Aaron L. Paolini, EM Photonics, Inc. (USA); Thomas E. Dillon, Richard D. Martin, Christopher A. Schuetz, Phase Sensitive Innovations, Inc. (USA); Dennis W. Prather, Univ. of Delaware (USA) . . . . [9462-21]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Mathematical principles of settings for extremely-high resolution instead of method regularization, Evgeni N. Terentiev, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9462-22]

System analysis and image processing for millimeter-wave holographic imaging based on non-local means, Zheng Li, Tsinghua Univ. (China); Zongjun Shen, Nuctech Co. Ltd. (China); Ziran Zhao, Lingbo Qiao, Tsinghua Univ. (China) . . . . [9462-23]

SEE PROFESSIONAL DEVELOPMENT COURSES
pages 145–214

CONFERENCE 9463

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9463

Motion Imagery: Standards, Quality, and Interoperability

Conference Chair: **Donnie Self,** National Geospatial-Intelligence Agency (USA)

Program Committee: **Jeffrey Malapit,** AMPS Strategies (USA); **Gary Nadler,** Consultant, Commercial Broadcast Industry (USA); **Norman S. Stein,** InTec, LLC (USA); **Bernie H. Street,** WiSC Enterprises (USA)

Monday 20 April

WELCOME AND OPENING REMARKS . . . . 8:30 AM TO 8:50 AM

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

SESSION 1. . . . . MON 8:50 AM TO 10:30 AM

FMV Foundations

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

Motion Imagery Standards Board (MISB) overview *(Invited Paper)*, Bryan E. Blank, National Geospatial-Intelligence Agency (USA) . . . . [9463-1]

Standards and interoperability 101: standards across the DoD enterprise *(Invited Paper)*, Mark Hary, 2d3 Sensing (USA). . . . . [9463-2]

Compression fundamentals: MPEG2, H.264, and HEVC H.265, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-3]

FMV end-to-end interoperability, Nancy B. Berkowitz, National Geospatial-Intelligence Agency (USA) . . . . [9463-4]

SESSION 2 . . . . MON 11:00 AM TO 12:00 PM

FMV Quality/Interoperability Assessment

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

FMV interoperability assessments and lessons learned, Leilani E. Morton, National Geospatial-Intelligence Agency (USA) . . . . [9463-5]

Video test equipment justification process, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-6]

Automated content and quality assessment of full-motion-video for the generation of meta data, Joshua D. Harguess, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9463-7]

Lunch Break . . . . .Mon 12:00 pm to 1:30 pm

SESSION 3 . . . . MON 1:30 PM TO 2:10 PM

FMV Interface Challenges

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

Interfaces, part one: implementation challenges of uncompressed video: 3G-SDI and HDMI with HDCP, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-8]

Interfaces, part two: implementation challenges of compressed video: transports streams over RF and IP, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-9]

SESSION 4 . . . . MON 2:10 PM TO 3:10 PM

FMV Big Data

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

Big data happiness *(Invited Paper)*, Andrew Eick, Mission Focus (USA); Suzanne Yoakum-Stover, Institute for Modern Intelligence (USA) . . . . . [9463-11]

Collaborative real-time motion video analysis by human observer and image exploitation algorithms, Jutta E. Hild, Wolfgang Krüger, Stefan Bruestle, Patrick Trantelle, Gabriel Unmüssig, Norbert Heinze, Elisabeth Peinsipp-Byma, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany) . . . . [9463-12]

File-based video QC and automation in enterprise and cloud implementations, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-13]

SESSION 5 . . . . MON 3:40 PM TO 4:20 PM

FMV Technical Considerations I

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

CODEC optimization and referenced objective evaluation, Karl J. Kuhn, Tektronix, Inc. (USA) . . . . [9463-14]

New long-zoom lens for 4K super 35mm digital cameras, Laurence J. Thorpe, Ryuhei Kamata, Canon U.S.A., Inc. (USA). . . . . [9463-15]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of
Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 6 . . . . .TUE 8:00 AM TO 9:40 AM

FMV Technical Considerations II

Session Chair: **Donnie B. Self,**
National Geospatial-Intelligence Agency (USA)

A very low-cost system for capturing 3D motion scans with color and texture data, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9463-16]

Projection of controlled repeatable real-time moving targets to test and evaluate motion imagery quality, Stephen D. Scopatz, Electro Optical Industries, Inc. (USA). . . . . [9463-17]

4K, ultra HD, and 8K realities, Karl J. Kuhn, Tektronix, Inc. (USA). . . . [9463-18]

Gamut and camera shading, Karl J. Kuhn, Tektronix, Inc. (USA). . . . . [9463-19]

FMV initiatives, Michael Guthrie, Harmonic, Inc. (USA). . . . . [9463-20]

DEFENSE + SECURITY

CONFERENCE 9464

Monday–Wednesday 20–22 April 2015 • Proceedings of SPIE Vol. 9464

Ground/Air Multisensor Interoperability, Integration, and Networking for Persistent ISR VI

Conference Chairs: **Tien Pham,** U.S. Army Research Lab. (USA); **Michael A. Kolodny,** U.S. Army Research Lab. (USA)

Program Committee: **Kevin L. Priddy,** Air Force Research Lab. (USA); **Flavio Bergamaschi,** IBM United Kingdom Ltd. (United Kingdom); **Robert Heathcock,** U.S. Defense Intelligence Agency (USA); **Olga Mendoza-Schrock,** Air Force Research Lab. (USA); **Gavin Pearson,** Defence Science and Technology Lab. (United Kingdom); **King K. Siu,** U.S. Army Armament Research, Development and Engineering Ctr. (USA); **Raja Suresh,** General Dynamics Advanced Information Systems (USA); **Robert Williams,** Air Force Research Lab. (USA)

Monday 20 April

CHAIRMAN WELCOME . . . . 8:30 AM TO 8:40 AM

SESSION 1. . . . . MON 8:40 AM TO 10:20 AM

Situational Understanding and Anomaly Determination

Session Chairs: **Michael A. Kolodny,** U.S. Army Research Lab. (USA); **Kevin L. Priddy,** Air Force Research Lab. (USA)

Tasking the Tweeters: obtaining actionable information from human sensors, Alun D. Preece, Cardiff Univ. (United Kingdom); Dave Braines, IBM United Kingdom Ltd. (United Kingdom); William Webberley, Cardiff Univ. (United Kingdom) . . . . [9464-1]

Exploring discriminative features for anomaly detection in public spaces, Archan Misra, Singapore Management Univ. (Singapore) . . . . [9464-2]

Detection of anomalous track patterns for long term surveillance, Shuowen Hu, U.S. Army Research Lab. (USA) . . . . [9464-3]

Experiences with an anomaly determination services, Prasanna Giridhar, Tarek Abdelzaher, Univ of Illinois at Urbana-Champaign (USA) . . . . [9464-4]

The use of visual programming tools and techniques for rapid in field situational application development in a coalition environment, David Conway-Jones, IBM United Kingdom Ltd. (United Kingdom) . . . . [9464-5]

SESSION 2 . . . . MON 10:50 AM TO 12:00 PM

Coalition Operations I

Session Chairs: **Tien Pham,** U.S. Army Research Lab. (USA); **Gavin Pearson,** Defence Science and Technology Lab. (United Kingdom)

Unified vision: NATO trials for ISR interoperability technologies *(Invited Paper)*, David L. Payton, U.S. Air Force (USA) . . . . [9464-6]

Standards-based MASINT ISR workflow overview, Eric Chen, Air Force Research Lab. (USA) . . . . [9464-7]

Networks sensing and adaptive processing: vision and challenges, Gavin Pearson, Defence Science and Technology Lab. (United Kingdom) . . . . [9464-8]

Lunch Break . . . . .Mon 12:00 pm to 1:10 pm

SESSION 3 . . . . .MON 1:10 PM TO 1:50 PM

Coalition Operations II

Session Chairs: **Gavin Pearson,** Defence Science and Technology Lab. (United Kingdom); **Tien Pham,** U.S. Army Research Lab. (USA)

Policy controlled access to analytics at the network edge, Geeth de Mel, Jorge J. Ortiz, Seraphin Calo, IBM Thomas J. Watson Research Ctr. (USA); Paul Sullivan, Intelpoint, Inc. (USA) . . . . [9464-9]

Computing on encrypted data and its applicability to a coalition operations environment, Flavio Bergamaschi, Graham Bent, IBM United Kingdom Ltd. (United Kingdom). . . . . [9464-10]

SESSION 4 . . . . MON 1:50 PM TO 3:10 PM

Interoperability and Networking: Architectures and Frameworks

Session Chairs: **Kevin L. Priddy,** Air Force Research Lab. (USA); **Michael A. Kolodny,** U.S. Army Research Lab. (USA)

The convergence of open systems and interoperable systems, Gavin Pearson, Defence Science and Technology Lab. (United Kingdom); John B. Ibbotson, IBM United Kingdom Ltd. (United Kingdom) . . . . [9464-11]

PED fusion via enterprise ontology, James R Schoening, U.S. Army Intelligence and Information Warfare Directorate (I2WD) (USA); Danielle Duff, U.S. Army CERDEC Intelligence and Information Warfare Directorate (USA); Tien Pham, U.S. Army Research Lab. (USA); Justin M. Del Vecchio, Ronald Rudnicki, CUBRC (USA) . . . . [9464-12]

The Sandia architecture for heterogeneous unmanned system control (SAHUC), Joshua A. Love, Stephen Buerger, Jason Neely, Wendy Amai, Charles Q. Little, Sandia National Labs. (USA) . . . . [9464-13]

Dual node decision wheels: an architecture for interconnected information fusion and decision making, Amy L. Sliva, Joe Gorman, Charles River Analytics, Inc. (USA); Christopher L. Bowman, Data Fusion Corp. (USA); Martin Voshell, Charles River Analytics, Inc. (USA) . . . . [9464-14]

SESSION 5 . . . . MON 3:40 PM TO 4:40 PM

Network Sensing and Processing for ISR Applications I

Session Chairs: **Flavio Bergamaschi,** IBM United Kingdom Ltd. (United Kingdom); **Robert Williams,** Air Force Research Lab. (USA)

Acoustical sensor network for hostile fire indicator for ground bases and helicopter-mounted applications, Pierre Naz, Sebastien Hengy, Martin Laurenzis, Institut Franco-Allemand de Recherches de Saint-Louis (France) . . . . [9464-15]

The effect of decentralization and communication networks on a set of ISR-gathering assets, Héctor J. Ortiz-Peña, CUBRC (USA); Michael J. Hirsch, ISEA TEK (USA) and Stetson Univ. (USA); Mark H. Karwan, Univ. at Buffalo (USA); Moises Sudit, CUBRC (USA) and Univ. at Buffalo (USA). . . . . . . [9464-16]

EO vehicle recognition through manifold learning under diverse lighting, Olga Mendoza-Schrock, Air Force Research Lab. (USA); Mateen M. Rizki, Wright State Univ. (USA) . . . . [9464-17]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 6 . . . . .TUE 9:00 AM TO 12:15 PM

Situation Awareness

Joint Session with Conferences 9458 and 9464

Session Chairs: **Igor V. Ternovskiy,** Air Force Research Lab. (USA); **Tien Pham,** U.S. Army Research Lab. (USA)

Situational consciousness for autonomous cyberspace operations *(Keynote Presentation)*, Steven K. Rogers, Air Force Research Lab. (USA). . . . . . . [9458-4]

Situational awareness: a holistic perspective your mother was afraid to tell you, Michael A Kolodny, US Army Research Lab (USA). . . . . [9464-18]

Qualia centric hypothetical thinking: applications to vehicle tracking with the fusion of EO and SAR input data sources *(Invited Paper)*, Jonathan L. White, Harding Univ. (USA); Anthony Helmstetter, Arizona State Univ. (USA); Jared L. Culbertson, Igor V. Ternovskiy, Air Force Research Lab. (USA) . [9458-5]

Automatic video-based classification of small group behavior to support situational understanding, Robert Williams, Air Force Research Lab. (USA); Julie A. Skipper, Skipper Consulting (USA). . . . . [9464-19]

Addressing cyber information overload with cognitive modeling constructs, Sandra L. Vaughan, Air Force Institute of Technology (USA) and U.S. Defense Intelligence Agency (USA); Robert F. Mills, Michael R. Grimaila, Gilbert L. Peterson, Air Force Institute of Technology (USA); Steven K. Rogers, Air Force Research Lab. (USA) . . . . [9458-6]

Why open system approaches matter, Kevin Priddy, Air Force Research Lab. (USA) . . . . [9464-20]

Lunch/Exhibition Break . . . . Tue 12:15 pm to 1:40 pm

SESSION 7 . . . . .TUE 1:40 PM TO 3:20 PM

Network Sensing and Processing for ISR Applications II

Session Chairs: **Olga Mendoza-Schrock,** Air Force Research Lab. (USA); **Michael A. Kolodny,** U.S. Army Research Lab. (USA)

Ground target tracking and classification in a unattended wireless sensor network, Benjamin Pannetier, Jean Dezert, Julien Moras, ONERA (France); Loic Canevet, Didier Cosson, Delegation Generale Pour L'Armament (France) . . . . [9464-21]

Feature extraction and classification using neurosynaptic processing at the edge of the network, Flavio Bergamaschi, Graham Bent, IBM United Kingdom Ltd. (United Kingdom) . . . . [9464-22]

UAV as a generic information provider in an ISR System of Systems, Jurgo Preden, Jaanus Kaugerand, Erki Suurjaak, Raido Pahtma, Sergei Astapov, Leo Motus, Tallinn Univ. of Technology (Estonia) . . . . [9464-23]

A micro services architecture for use by microcontroller driven devices to provide interoperability with the open lean services architecture, Nicholas Peach, 2iC Ltd. (United Kingdom). . . . . [9464-24]

Visibility based multi-agent surveillance strategies in decentralized network, Rui Zou, Sourabh Bhattacharya, Iowa State Univ. (USA) . . . . [9464-25]

SESSION 8 . . . . .TUE 3:50 PM TO 5:10 PM

Sensor, Data and Information Processing and Fusion Algorithms

Session Chairs: **Kevin L. Priddy,** Air Force Research Lab. (USA); **Gavin Pearson,** Defence Science and Technology Lab. (United Kingdom)

Bayesian hidden Markov models for UAV-enabled target localization on road networks with soft-hard data, Nisar R. Ahmed, Univ. of Colorado at Boulder (USA); David Casbeer, Yongcan Cao, Derek B. Kingston, Air Force Research Lab. (USA) . . . . [9464-26]

Corrected pose data for the Wright Patterson Air Force Base (WPAFB) 2009 wide area motion imagery (WAMI) data set, Curtis Cohenour, Ohio Univ. (USA); Rebecca L. Price, U.S. Air Force (USA); Todd V. Rovito, Air Force Research Lab. (USA); Frank van Graas, Ohio Univ. (USA) . . . . [9464-27]

Classification of vibrometry data, Karmon M. Vongsy, Air Force Research Lab. (USA); Ashley N. Smith, Wright State Univ. (USA) . . . . [9464-28]

Predicting exploitation success on compressed imagery through common image quality metrics: an initial look, Christopher McGuinness, Univ. of Dayton Research Institute (USA). . . . . [9464-29]

Wednesday 22 April

SESSION 9 . . . . .WED 1:20 PM TO 4:30 PM

Novel Sensing and Signal Processing

Session Chairs: **Olga Mendoza-Schrock,** Air Force Research Lab. (USA); **Flavio Bergamaschi,** IBM United Kingdom Ltd. (United Kingdom)

Real-time algorithms for data reduction and smart sensing with high frame rate CMOS image sensor, Blake C. Jacquot, Nathan G. Johnson-Williams, The Aerospace Corp. (USA) . . . . [9464-30]

Beyond H.264: implications of next generation video compression on surveillance imagery, Christopher McGuinness, Univ. of Dayton Research Institute (USA) . . . . [9464-31]

Binocular link for smartphone (BLINKS) demonstration, Paul Yun, King K. Siu, Paul D. Willson, U.S. Army Armament Research, Development and Engineering Ctr. (USA); Fred J. Fitzsimmons, Contractor (USA). . . . . . . [9464-32]

Phased array beamformer performance in variable environments, David R. Bergman, Exact Solution Scientific Consulting LLC (USA). . . . . [9464-33]

Classification of uncooperative vehicles with sparse laser Doppler vibrometry measurements, Jie Wei, Chi-Him Liu, Zhigang Zhu, The City College of New York (USA); Olga Mendoza-Schrock, Karmon M. Vongsy, Air Force Research Lab. (USA). . . . . [9464-34]

Sources of uncertainty in feature-based image registration algorithms, Paul Sundlie, Joseph Fernando, Univ. of Dayton Research Institute (USA); Clark N. Taylor, Air Force Research Lab. (USA) . . . . [9464-35]

Ultra-wideband 3D position referenced environment for enhanced detection, marking, neutralization and change detection, David J. Bruemmer, 5D Robotics Inc. (USA); Robert L. Wade, U.S. Army Armament Research, Development and Engineering Ctr. (USA); Vince Matriciano, U.S. Army Program Executive Office Ammunition (USA); Jon Whetten, R. Scott Hartley, 5D Robotics Inc. (USA) . . . . [9464-36]

YUV chrominance sub-sampling comparison using H.264, Andrew Thompson, Eric Balster, Univ. of Dayton (USA) . . . . [9464-37]

CONFERENCE 9465A

Tuesday–Wednesday 21–22 April 2015 • Part of Proceedings of SPIE Vol. 9465

Laser Radar Technology and Applications XX

Conference Chairs: **Monte D. Turner,** Air Force Research Lab. (USA); **Gary W. Kamerman,** FastMetrix, Inc. (USA)

Program Committee: **Philip Gatt,** Lockheed Martin Coherent Technologies (USA); **Dominique Hamoir,** ONERA (France); **Richard M. Heinrichs,** Defense Advanced Research Projects Agency (USA); **Vasyl Molebny,** National Taras Shevchenko Univ. of Kyiv (Ukraine); **Russell Philbrick,** North Carolina State Univ. (USA); **Upendra N. Singh,** NASA Langley Research Ctr. (USA); **Ove K. Steinvall,** Swedish Defence Research Agency (Sweden); **Douglas G. Youmans,** SPARTA Inc./Parsons Corp. (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 8:20 AM TO 10:00 AM

LIDAR Design/Demonstrations

Session Chair: **Monte D. Turner,** Air Force Research Lab. (USA)

Imaging flash lidar for safe landing on solar system bodies and spacecraft rendezvous and docking, Farzin Amzajerdian, Vincent E. Roback, NASA Langley Research Ctr. (USA); Alexander E. Bulyshev, Analytical Mechanics Associates, Inc. (USA); Paul F. Brewster, Glenn D. Hines, NASA Langley Research Ctr. (USA); Diego F. Pierrottet, Coherent Applications, Inc. (USA); Larry B. Petway, NASA Langley Research Ctr. (USA). . . . . [9465-1]

Improved resolution in time-of-flight measurement in a multi-pulse scanning-ladar system, Yury Y. Markushin, Renu Tripathi, Gour S. Pati, Delaware State Univ. (USA). . . . . [9465-2]

Laser safety in design of near-infrared scanning lidars, Xiang Zhu, Dave Elgin, Neptec Design Group Ltd. (Canada) . . . . [9465-3]

Novel, ultra-compact, high-performance, eye-safe laser rangefinder for demanding applications, Mark Silver, Stephen T. Lee, Andrew G. Borthwick, Graham Morton, Craig McNeill, David McSporran, Ian McRae, Gordon McKinlay, William Alexander, David Jackson, Craig Smith, Colin Scouller, Thales Optronics Ltd. (United Kingdom). . . . . [9465-4]

OEM fiber laser rangefinder for long-distance measurement, Alexandre Corman, Frédéric Chiquet, Thomas Avisse, SensUp (France); Marc Le Flohic, Keopsys SA (France); Nicolas Picard, SensUp (France) . . . . [9465-5]

SESSION 2 . . . . .TUE 10:30 AM TO 11:50 AM

Emerging LIDAR Applications I

Session Chair: **Gary Kamerman,** FastMetrix, Inc. (USA)

Active and passive EO sensing for the detection of humans and handheld objects, Ove Steinvall, Håkan Larsson, Magnus Pettersson, Swedish Defence Research Agency (Sweden) . . . . [9465-6]

Anomaly detection in clutter using spectrally enhanced ladar, Puneet S. Chhabra, Andrew M. Wallace, Heriot-Watt Univ. (United Kingdom); James R. Hopgood, The Univ. of Edinburgh (United Kingdom) . . . . [9465-7]

Study of a dual mode SWIR active imaging system for direct imaging and non line of sight vision, Martin Laurenzis, Frank Christnacher, Institut Franco-Allemand de Recherches de Saint-Louis (France); Andreas Velten, Univ. of Wisconsin-Madison (USA) and Morgridge Institute for Research (USA). . [9465-8]

High efficiency chirped Bragg gratings for stretching and compression of ultra short laser pulses at 800 nm, Vadim Smirnov, Leonid B. Glebov, Alexei L. Glebov, Oleksiy Mokhun, Larissa Glebova, Eugeniu Rotari, Ion Cohanoschi, Oleg Smolsky, OptiGrate Corp. (USA) . . . . [9465-9]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . TUE 1:20 PM TO 2:00 PM

Emerging LIDAR Applications II

Session Chair: **Gary Kamerman,** FastMetrix, Inc. (USA)

Atmospheric aerosol and molecular backscatter imaging effects on direct detection ladar, Douglas G. Youmans, Parsons Corp. (USA) . . . . [9465-10]

All-fiber, compact, coherent wind lidar development for environmental monitoring applications, Narasimha S. Prasad, NASA Langley Research Ctr. (USA); Steven Vetorino, Allen J. Tracy, Rich Higgins, Russel Sibell, Sibelloptics, LLC (USA) . . . . [9465-11]

SESSION 4 . . . . TUE 2:00 PM TO 4:10 PM

Advanced and Realtime LIDAR Data Processing

Session Chair: **Ove Steinvall,**
Swedish Defence Research Agency (Sweden)

Automated feature extraction for 3-dimensional point clouds, Alexander A. Soderlund, Johnathan H. Racz, Amy L. Neuenschwander, Lori A. Magruder, Applied Research Lab. (USA) . . . . [9465-12]

Dynamic voxel modeling resolution based on quality assessments from lidar path tracing, Shea Hagstrom, Joshua B. Broadwater, Johns Hopkins Univ. Applied Physics Lab., LLC (USA). . . . . [9465-13]

Agile-beam laser radar using computational imaging for robotic perception, Michael A. Powers, General Dynamics Robotic Systems (USA); Barry L. Stann, Mark M. Giza, U.S. Army Research Lab. (USA) . . . . [9465-14]

Low-SWaP coincidence processing for Geiger-mode lidar video, Myron Z. Brown, Noel P. Cervino, Zachary D. Kurtz, Steven E. Schultz, Johns Hopkins Univ. (USA) . . . . [9465-15]

Real-time on-board airborne demonstration of high-speed on-board data processing for science instruments (HOPS), Jeffrey Y. Beyon, Tak-Kwong Ng, Mitchell J. Davis, James K. Adams, Stephen C. Bowen, James J. Fay, Mark A. Hutchinson, NASA Langley Research Ctr. (USA) . . . . [9465-16]

Wednesday 22 April

SESSION 5 . . . . .WED 9:00 AM TO 10:00 AM

3D Data Fusion and Visualization

Session Chair: **Douglas G. Youmans,** Parsons Corp. (USA)

Registration of multiple texel images (fused lidar/digital imagery) to form a 3D image, Mehedi Hasan, Scott E. Budge, Utah State Univ. (USA) . . . [9465-17]

Textured digital elevation model formation from low-cost UAV ladar/digital image data, Taylor C. Bybee, Scott E. Budge, Utah State Univ. (USA). [9465-18]

Visualization of 3D images from multiple texel images created from fused lidar/digital imagery, Cody Killpack, Scott E. Budge, Utah State Univ. (USA) . . . . [9465-19]

DEDICATED EXHIBITION TIME AND LUNCH BREAK

10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 5 . . . . .WED 1:00 PM TO 2:20 PM

LIDAR Foliage Penetration Imaging

Session Chair: **Monte D. Turner,** Air Force Research Lab. (USA)

Modeling individual tree crowns in an urban environment using dense discrete return lidar, Madhurima Bandyopadhyay, Jan A. N. van Aardt, Martin van Leeuwen, Rochester Institute of Technology (USA) . . . . [9465-20]

Simulation of lidar propagation through a tree canopy in 3D, Angela M. Kim, Richard C. Olsen, Naval Postgraduate School (USA); Martin Béland, Univ. Laval (Canada) . . . . [9465-21]

Comparison of full-waveform, photon counting and discrete analog lidar data, Scott C. Runyon, Angela M. Kim, Jeremy P. Metcalf, Richard C. Olsen, Naval Postgraduate School (USA). . . . . [9465-22]

Exploitation of multi-wavelength lidar for terrain classification and foliage penetration, Richard C. Olsen, Naval Postgraduate School (USA); Chelsea H. Esterline, Naval Postgraduate School (Chile); Angela M. Kim, Jeremy P. Metcalf, Naval Postgraduate School (USA). . . . . [9465-23]

CONFERENCE 9465B

Thursday 23 April 2015 • Part of Proceedings of SPIE Vol. 9465

Atmospheric Propagation XII

Conference Chairs: **Linda M. Wasiczko Thomas,** U.S. Naval Research Lab. (USA); **Earl J. Spillar,** Air Force Research Lab. (USA)

Program Committee: **Ammar Al-Habash,** Raytheon Space & Airborne Systems (USA); **Gary Baker,** Lockheed Martin Space Systems Co. (USA); **Gary G. Gimmestad,** Georgia Tech Research Institute (USA); **Ken J. Grant,** Defence Science and Technology Organisation (Australia); **Juan C. Juarez,** Johns Hopkins Univ. Applied Physics Lab. (USA); **Christopher I. Moore,** U.S. Naval Research Lab. (USA); **William S. Rabinovich,** U.S. Naval Research Lab. (USA); **Jonathan M. Saint Clair,** The Boeing Co. (USA); **David H. Tofsted,** U.S. Army Research Lab. (USA); **Morio Toyoshima,** National Institute of Information and Communications Technology (Japan); **Cynthia Y. Young,** Univ. of Central Florida (USA)

Thursday 23 April

SESSION 6 . . . . THU 9:00 AM TO 10:20 AM

Atmospheric Turbulence I

Session Chair: **Juan C. Juarez,** Johns Hopkins Univ. Applied Physics Lab., LLC (USA)

An updated look at tilt-removed beam propagation in the atmosphere, Gary Baker, Lockheed Martin Space Systems Co. (USA) . . . . [9465-24]

Wavefront sensing and phase reconstruction with multi-aperture Zernike filter, Mikhail A. Vorontsov, Univ. of Dayton (USA) and Optonicus (USA); Svetlana L. Lachinova, Mathieu Aubailly, Optonicus (USA); Behzad Bordbar, Univ. of Dayton (USA) . . . . [9465-25]

Optical turbulence with anisotropy at different scales and its effect on laser beam propagation along vertical paths, Italo Toselli, Olga Korotkova, Univ. of Miami (USA). . . . . [9465-26]

Scientific data analysis of atmospheric turbulence through distributed computing, Sara B. Belichki, Christopher A. Smith, Joseph T. Coffaro, Michael G. Panich, Ronald L. Phillips, Larry C. Andrews, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9465-27]

SESSION 7 . . . . THU 10:50 AM TO 12:30 PM

Atmospheric Turbulence II

Session Chair: **Gary Baker,** Lockheed Martin Space Systems Co. (USA)

A low cost, low power, S-band radar for atmospheric turbulence studies, Thomas C. Farrell, Air Force Research Lab. (USA) . . . . [9465-28]

Evaluation of atmospheric refractive index gradient variability from time-lapse imaging, Jack E. McCrae, Santasri Basu, Air Force Institute of Technology (USA) and Oak Ridge Institute for Science & Education (USA); Zach B. Pollock, Miami Univ. (USA); Steven T. Fiorino, Air Force Institute of Technology (USA) . . . . [9465-29]

Increasing persistence through scattering environments by using circularly polarized light, John D. van der Laan, College of Optical Sciences, The Univ. of Arizona (USA) and Sandia National Labs. (USA); David A. Scrymgeour, Jeremy B. Wright, Shanalyn A. Kemme, Sandia National Labs. (USA); Eustace L. Dereniak, College of Optical Sciences, The Univ. of Arizona (USA) . . . . [9465-30]

Scintillation effects of double-pass optical beams in atmospheric turbulence, Joseph T. Coffaro, Michael G. Panich, Univ. of Central Florida (USA); Sara B. Belichki, Christopher A. Smith, Ronald L. Phillips, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Larry C. Andrews, Univ. of Central Florida (USA) . . . . [9465-31]

The spectral transparency of the surface layer marine and coastal atmosphere, Gennady A. Kaloshin, V.E. Zuev Institute of Atmospheric Optics (Russian Federation) . . . . [9465-32]

Lunch/Exhibition Break . . . . Thu 12:30 pm to 1:50 pm

SESSION 8 . . . . THU 1:50 PM TO 3:30 PM

Free Space Laser Communication

Session Chair: **Christopher I. Moore,** U.S. Naval Research Lab. (USA)

Low-SWAP lasercomm terminal architecture for high-bandwidth communications under highly scintillated links, Juan C. Juarez, Radha Venkat, Ryan P. DiNello-Fass, David M. Brown, Hala Tomey, Johns Hopkins Univ. Applied Physics Lab., LLC (USA). . . . . [9465-33]

Lasercomm beacon architecture for link acquisition in highly scintillated environments, Radha Venkat, Juan C. Juarez, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . . [9465-34]

Demonstrating capacity-approaching FSO communications, Thomas R. Halford, Michael P. Fitz, Cenk Kose, Jonathan Cromwell, Steven Gordon, TrellisWare Technologies, Inc. (USA) . . . . [9465-35]

The ONR high-bandwith Lasercom project update, Linda M. Thomas, Christopher I. Moore, William S. Rabinovich, U.S. Naval Research Lab. (USA) . . . . [9465-36]

The ONR high-bandwidth lasercom project: analysis of propagation data, William S. Rabinovich, Christopher I. Moore, Linda M. Thomas, U.S. Naval Research Lab. (USA) . . . . [9465-37]

INTERACTIVE POSTER SESSION

THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

The effect of the aero-optic's additional focal length on the airborne platform laser communication optical system, Yuan Hu, Changchun Univ. of Science and Technology (China) and Beijing Institute of Technology (China); Tianyuan Gao, Changchun Univ. of Science and Technology (China); Dewen Cheng, Beijing Institute of Technology (China); Shoufeng Tong, Huilin Jiang, Changchun Univ. of Science and Technology (China) . . . . [9465-38]

CONFERENCE 9466

Tuesday–Wednesday 21–22 April 2015 • Proceedings of SPIE Vol. 9466

Laser Technology for Defense and Security XI

Conference Chairs: **Mark Dubinskii,** U.S. Army Research Lab. (USA); **Stephen G. Post,** Missile Defense Agency (USA)

Program Committee: **Steven R. Bowman,** U.S. Naval Research Lab. (USA); **Iyad Dajani,** Air Force Research Lab. (USA); **Fabio Di Teodoro,** The Aerospace Corp. (USA); **Anthony M. Johnson,** Univ. of Maryland, Baltimore County (USA); **Don D. Seeley,** High Energy Laser Joint Technology Office (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 8:40 AM TO 10:00 AM

Mid-IR and UV-Vis Lasers

Session Chair: **Anthony M. Johnson,** Univ. of Maryland, Baltimore County (USA)

Ring cavity surface emitting quantum cascade laser with a near Gaussian beam profile, Pedro N. Figueiredo, Robert E. Peale, Andrey V. Muraviev, Univ. of Central Florida (USA). . . . . [9466-1]

Continuous-wave deep ultraviolet sources for resonance Raman explosive sensing, Balakishore Yellampalle, Robert B. Martin, Mikhail Sluch, Robert V. Ice, William B. McCormick, Brian E. Lemoff, West Virginia High Technology Consortium Foundation (USA). . . . . [9466-2]

AlGaInN laser diode technology and systems for defence and security applications, Stephen P. Najda, Piotr Perlin, Tadek Suski, Lucja Marona, Mike Bockowski, Mike Leszczynski, Przemek Wisniewski, Robert Czernecki, TopGaN Ltd. (Poland); Robert Kucharski, Ammono S.A. (Poland); George Tagowski, TopGaN Ltd. (Poland); Scott Watson, Antony Kelly, Univ. of Glasgow (United Kingdom) . . . . [9466-3]

Recent progress in high-power ultrafast thulium-doped fiber lasers and mid-infrared supercontinuum sources, Jiang Liu, Hongxing Shi, Kun Liu, Fangzhou Tan, Pu Wang, Beijing Univ. of Technology (China) . . . . [9466-4]

SESSION 2 . . . . .TUE 10:30 AM TO 11:50 AM

Progress in Diode Lasers/Novel Bulk Solid-state Lasers

Session Chair: **Mark Dubinskii,** U.S. Army Research Lab. (USA)

High temperature operating diode laser pumps for directed energy fiber lasers, Manoj Kanskar, Ling Bao, Zhigang Chen, Mark DeVito, Weimin Dong, Xingguo Guan, David M. Hemenway, Walter Sanders, Jim Zhang, Shiguo Zhang, nLIGHT Corp. (USA) . . . . [9466-5]

Higher efficiency low weight, high-brightness fiber pump modules, David A. Irwin, DILAS Diode Laser, Inc. (USA); Andreas Bayer, Wilhelm Fassbender, Jens Biesenbach, DILAS Diodenlaser GmbH (Germany); Steven G. Patterson, DILAS Diode Laser, Inc. (USA) . . . . [9466-6]

Resonantly pumped, Kerr-lens mode-locked Er:YVO_4 laser, Nikolay E. Ter-Gabrielyan, Viktor Fromzel, Mark Dubinskii, U.S. Army Research Lab. (USA) . . . . [9466-7]

DBR and DFB lasers in Nd and Yb doped photo-thermo-refractive glasses, Aleksandr I. Ryasnyanskiy, OptiGrate Corp. (USA); Nikolai Vorobiev, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Vadim Smirnov, OptiGrate Corp. (USA); Julien Lumeau, Larissa Glebova, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Oleksiy Mokhun, Christine Spiegelberg, OptiGrate Corp. (USA); Michael A. Krainak, NASA Goddard Space Flight Ctr. (USA); Alexei L. Glebov, OptiGrate Corp. (USA); Leonid B. Glebov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) and OptiGrate Corp. (USA). . . . . [9466-8]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . .TUE 1:20 PM TO 3:00 PM

Fiber Lasers: Power Scaling

Session Chair: **Stephen G. Post,** Missile Defense Agency (USA)

High-power operation of Yb-doped fiber laser at 976 nm. Present status and applications *(Invited Paper)*, Eric Cormier, Univ. Bordeaux 1 (France) . . . . [9466-9]

Advances in resonantly-pumped Tm-doped fiber amplifiers, Daniel Creeden, Benjamin R. Johnson, Glen A. Rines, Scott D. Setzler, BAE Systems (USA). . . . . [9466-10]

Higher order mode selection for power scaling in laser resonators using transmitting Bragg gratings, Brian M. Anderson, George B. Venus, Daniel Ott, Ivan B. Divliansky, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Jay W. Dawson, Derrek R. Drachenberg, Michael J. Messerly, Paul H. Pax, John B. Tassano, Lawrence Livermore National Lab. (USA); Leonid B. Glebov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9466-11]

Laser beam characteristics of optical phased arrays, Yakov G. Soskind, DHPC Technologies (USA) . . . . [9466-12]

SESSION 4 . . . . TUE 3:30 PM TO 5:10 PM

New Laser and Nonlinear Materials and Their Properties

Session Chair: **George A. Newburgh,** U.S. Army Research Lab. (USA)

Thermally and mechanically enhanced phosphate glasses for eye-safe lasers, Paula Vullo, Simi A. George, SCHOTT North America, Inc. (USA) . . . . [9466-13]

Magneto-optical properties of fluorinated silicate glasses doped with rare earth ions, Aleksandr I. Ryasnyanskiy, Vadim Smirnov, OptiGrate Corp. (USA); Helene Mingareev, Axel Schülzgen, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Alexei L. Glebov, OptiGrate Corp. (USA); Larissa Glebova, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA); Leonid B. Glebov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) and OptiGrate Corp. (USA) . . [9466-14]

Transition metal doped gallium nitride laser materials, Steven Bowman, U.S. Naval Research Lab. (USA); Christopher G. Brown, Univ. Research Foundation (USA); Jacob H. Leach, Kevin Udwary, Kyma Technologies, Inc. (USA) [9466-15]

Frequency conversion with quasi-phase matched gallium nitride, Steven Bowman, U.S. Naval Research Lab. (USA); Christopher G. Brown, Univ. Research Foundation (USA); Jennifer K. Hite, Jaime A. Freitas Jr., Francis J. Kub, Charles R. Eddy Jr., Jerry R. Meyer, Igor Vurgaftman, U.S. Naval Research Lab. (USA); Jacob H. Leach, Kevin Udwary, Kyma Technologies, Inc. (USA) . . . . [9466-16]

Spectroscopic properties of Er-doped Y2O3 ceramic related to mid-IR laser transition, Tigran Sanamyan, Zackery D. Fleischman, U.S. Army Research Lab. (USA) . . . . [9466-17]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Yb-fiber-MOPA based high energy and average power uplink laser beacon for deep space communication operating under Nested PPM format, Doruk Engin, Ibraheem Darab, John Burton, Frank Kimpel, Shantanu Gupta, Fibertek, Inc. (USA). . . . . [9466-30]

Proposal of a defense application for a chemical oxygen laser, Kiwamu Takehisa, O2 Laser Lab. (Japan). . . . . [9466-31]

Wednesday 22 April

SESSION 5 . . . . WED 8:20 AM TO 10:00 AM

Pulsed Fiber Lasers and SBS Mitigation

Session Chair: **Steven Bowman,** U.S. Naval Research Lab. (USA)

Stimulated Brillouin scattering in optical fibers with end reflections excited by broad-band pump waves with different spectral shapes, Mark S. Bowers, Robert S. Afzal, Lockheed Martin Aculight (USA) . . . . [9466-18]

Mode-locked and Q-switched fiber lasers with graphene oxide based saturable absorber *(Invited Paper)*, Pu Wang, Jiang Liu, Beijing Univ. of Technology (China) . . . . [9466-19]

Narrow-band, all-fiber 100W 20-ps Yb-doped fiber laser source, Robert A. Stegeman, Ye Huang, Eric D. Park, Peter F. Moulton, Q-Peak, Inc. (USA) . . . . [9466-20]

Arbitrary phase modulation for optical spectral control and suppression of stimulated Brillouin scattering, Johan Nilsson, Achar V. Harish, Univ. of Southampton (United Kingdom) . . . . [9466-21]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 6 . . . . WED 1:20 PM TO 3:00 PM

Novel Fiber Lasers

Session Chair: **Don D. Seeley,**
High Energy Laser Joint Technology Office (USA)

Continuous-wave fiber Raman lasers cladding-pumped directly by diodes *(Invited Paper)*, Johan Nilsson, Tianfu Yao, Achar V. Harish, Jayanta K. Sahu, Univ. of Southampton (United Kingdom) . . . . [9466-22]

Diode pumped Tm/Ho composite Fiber 2.1 µm laser, George A. Newburgh, U.S. Army Research Lab. (USA) . . . . [9466-23]

Extra-low Brillouin gain optical fiber derived from Er-doped sapphire ceramic, Mark Dubinskii, Tigran Sanamyan, Robert Pavlacka, U.S. Army Research Lab. (USA); Thomas W. Hawkins, Clemson Univ. (USA); Peter D. Dragic, Univ. of Illinois at Urbana-Champaign (USA); John Ballato, Clemson Univ. (USA) . . . . [9466-24]

Power scaling of resonantly-pumped double-clad fiber laser based on Yb-free Er-doped silicate glass, Jun Zhang, Radha Pattnaik, U.S. Army Research Lab. (USA); Shibin Jiang, AdValue Photonics, Inc. (USA); Mark Dubinskii, U.S. Army Research Lab. (USA) . . . . [9466-25]

SESSION 7 . . . . WED 3:30 PM TO 4:50 PM

Novel Laser-based Practical Devices and Systems

Session Chair: **Nikolay E. Ter-Gabrielyan,**
U.S. Army Research Lab. (USA)

Novel broadly tunable fiber laser system, Steven Bowman, U.S. Naval Research Lab. (USA); Christopher G. Brown, Univ. Research Foundation (USA) . . . . [9466-26]

A passively q-switched compact solid-state laser, Bhabana Pati, Eric D. Park, Q-Peak, Inc. (USA). . . . . [9466-27]

Development of a compact laser target designator, Stephen T. Lee, Andrew G. Borthwick, Graham Morton, Ian McRae, Norman Imlach, George Gardiner, Gordon McKinlay, William Alexander, Mark Silver, Thales UK Ltd. (United Kingdom). . . . . [9466-28]

20.2W CW 2.118µm Ho:$YAlO_3$ laser pumped by 1.915µm Tm-doped fiber laser, Ting Yu, Gang Bai, Zhongguo Yang, Weibiao Chen, Shanghai Institute of Optics and Fine Mechanics (China). . . . . [9466-29]

CONFERENCE 9467

Monday–Friday 20–24 April 2015 • Proceedings of SPIE Vol. 9467

Micro- and Nanotechnology Sensors, Systems, and Applications VII

Conference Chairs: **Thomas George,** ChromoLogic (USA); **Achyut K. Dutta,** Banpil Photonics, Inc. (USA); **M. Saif Islam,** Univ. of California, Davis (USA)

Program Committee: **Roger Appleby,** Queen's Univ. Belfast (United Kingdom); **Debjyoti Banerjee,** Texas A&M Univ. (USA); **Michael P. Buric,** National Energy Technology Lab. (USA); **Richard Conroy,** National Institutes of Health (USA); **Ertugrul Cubukcu,** Univ. of Pennsylvania (USA); **Aykutlu Dana,** Bilkent Univ. (Turkey); **Nibir K. Dhar,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Muhammad M. Hussain,** King Abdullah Univ. of Science and Technology (Saudi Arabia); **Matthew E. L. Jungwirth,** Honeywell Defense and Space Electronic Systems (USA); **Anupama B. Kaul,** National Science Foundation (USA); **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **Susan M. Maley,** U.S. Dept. of Energy (USA); **Michael C. McAlpine,** Princeton Univ. (USA); **Parvaneh Mokarian-Tabari,** Univ. College Coek (Ireland); **William D. Nothwang,** U.S. Army Research Lab. (USA); **Stergios J. Papadakis,** Johns Hopkins Univ. Applied Physics Lab., LLC (USA); **Michael K. Rafailov,** The Reger Group (USA); **Bilge Saruhan-Brings,** Deutsches Zentrum für Luft- und Raumfahrt (Germany); **Antonio Sastre,** National Institutes of Health (USA); **Noriko Satake,** UC Davis Medical Ctr. (USA); **Sivalingam Sivananthan,** Univ. of Illinois at Chicago (USA); **Andre U. Sokolnikov,** Visual Solutions and Applications (USA); **Kyung-Ah Son,** HRL Labs., LLC (USA); **Thomas G. Thundat,** Univ. of Alberta (Canada); **Richard Vaia,** Air Force Research Lab. (USA); **Christopher C. Wilcox,** U.S. Naval Research Lab. (USA); **Joyce Wong,** Schlumberger Ltd. (USA), California Institute of Technology {United States); **Eui-Hyeok Yang,** Stevens Institute of Technology (USA)

Monday 20 April

SESSION 1. . . . . MON 8:00 AM TO 12:30 PM

Flexible, Stretchable, Transient Electronics: What's Next?

Session Chair: **Muhammad M. Hussain,** King Abdullah Univ. of Science and Technology (Saudi Arabia)

Epidermal and bioresorbable electronic systems for clinical medicine *(Invited Paper)*, John A. Rogers, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9467-1]

Edible Electronics: materials and devices for next-generation medical implants *(Invited Paper)*, Christopher J. Bettinger, Carnegie Mellon Univ. (USA) . . . . [9467-2]

A strategy for establishing stable contact between machine/biological tissue *(Invited Paper)*, Sungwon Lee, The Univ. of Tokyo (Japan) . . . . . . [9467-3]

Molecularly stretchable electronics for mechanically robust and wearable semiconductor devices *(Invited Paper)*, Darren J. Lipomi, Univ. of California, San Diego (USA) . . . . [9467-4]

Soft Electronics: current trends and future challenges *(Invited Paper)*, Rebecca K. Kramer, Purdue Univ. (USA) . . . . [9467-5]

Liquid metals as ultra-stretchable, soft, and shape reconfigurable conductors *(Invited Paper)*, Michael D. Dickey, North Carolina State Univ. (USA) . . . . [9467-6]

Transformational electronics are now reconfiguring *(Invited Paper)*, Muhammad M. Hussain, Jhonathan Rojas, Galo Torres Sevilla, Aftab Hussain, Sally Ahmed, Joanna Nassar, Rabab Bahabry, Arwa Kutbee, Bidoor Alsaif, Amani Almuslem, Nasir Alfaraj, Meshal Alawein, King Abdullah Univ. of Science and Technology (Saudi Arabia) . . . . [9467-7]

Low cost, high throughput cut-and-paste manufacture of multifunctional epidermal electronic systems *(Invited Paper)*, Nanshu Lu, The Univ. of Texas at Austin (USA) . . . . [9467-8]

Flexible phosphorene devices and circuits *(Invited Paper)*, Weinan Zhu, Deji Akinwande, The Univ. of Texas at Austin (USA). . . . . [9467-9]

Transfer printing methods for fabricating nanowire devices on diverse substrates *(Invited Paper)*, Xiaolin Zheng, Stanford Univ. (USA) . . . . . . [9467-10]

High performance biointegrated electronic devices *(Invited Paper)*, Dae-Hyeong Kim, Donghee Son, Jaemin Kim, Seoul National Univ. (Korea, Republic of) . . . . [9467-11]

Paper electronics: the next flexible, foldable,and stretchable electronics *(Invited Paper)*, Jr-Hau He, King Abdullah Univ. of Science and Technology (Saudi Arabia); Der-Hsien Lien, Po-Kang Yang, National Taiwan Univ. (Taiwan); Chun-Ho Lin, King Abdullah Univ. of Science and Technology (Saudi Arabia) . . . . [9467-12]

Lunch Break . . . . Mon 12:30 pm to 1:30 pm

SESSION 2 . . . . MON 1:30 PM TO 3:10 PM

Low-Intensity Energy Delivery for Biomodulation I

Joint Session with Conferences 9467 and 9460

Session Chair: **Richard Conroy,** National Institutes of Health (USA)

20 kHz ultrasound assisted treatment of chronic wounds with concurrent optic monitoring *(Invited Paper)*, Peter A. Lewin, Christopher R. Bawiec, Youhan Sunny, Joshua A. Samuels, Drexel Univ. (USA); Michael S. Weingarten, Drexel Univ. College of Medicine (USA); Leonid A. Zubkov, Drexel Univ. (USA); David J. Margolis, Univ. of Pennsylvania (USA); Michael T. Neidrauer, Drexel Univ. (USA) . . . . [9467-13]

Guiding tissue regeneration in vitro and in vivo with ultrasound technologies *(Invited Paper)*, Diane Dalecki, Denise C. Hocking, Univ. of Rochester (USA) . . . . [9467-14]

Ultrasound induced neurostimulation *(Invited Paper)*, Randy L. King, U.S. Food and Drug Administration (USA) . . . . [9467-15]

Targeted delivery of GABA via ultrasound-induced blood-brain barrier disruption blocks somatosensory-evoked potentials *(Invited Paper)*, Nathan McDannold, Yongzhi Zhang, Chanikarn Power, Costas Arvanitis, Natalia Vykhodtseva, Brigham and Women's Hospital (USA); Margaret Livingstone, Harvard Medical School (USA) . . . . [9467-16]

Ultrasound-based biomodulation mechanisms, devices and applications in medicine *(Invited Paper)*, George K. Lewis, ZetrOZ, Inc. (USA). . . . . . . [9467-17]

SESSION 3 . . . . MON 3:40 PM TO 4:40 PM

Low-intensity Energy Delivery for Biomodulation II

Joint Session with Conferences 9467 and 9460

Session Chair: **Richard Conroy,** National Institutes of Health (USA)

Antimicrobial blue light therapy for microbial wound infections *(Invited Paper)*, Tianhong Dai, Massachusetts General Hospital (USA) and Harvard Medical School (USA) . . . . [9467-18]

Therapeutic efficacy of photobiomodulation for the treatment of autoimmune demyelination *(Invited Paper)*, Jeri-Anne Lyons, Univ. of Wisconsin-Milwaukee (USA) . . . . [9467-19]

CONFERENCE 9467

Red/near-infrared light-emitting diode therapy for traumatic brain injury *(Invited Paper)*, Margaret A. Naeser, VA Boston Healthcare System (USA); Paula I. Martin, Michael Ho, Maxine H. Krengel, Yelena Bogdanova, VA Boston Healthcare System (USA) and Boston Univ. School of Medicine (USA); Jeffrey A. Knight, VA Boston Healthcare System (USA); Megan K. Yee, VA Boston Healthcare System (USA) and Boston Univ. School of Public Health (USA); Ross Zafonte, Spaulding Rehabilitation Hospital (USA) and Harvard Medical School (USA); Judith A. Frazier, Spaulding Rehabilitation Hospital (USA); Michael R. Hamblin, Wellman Ctr. for Photomedicine (USA) and Harvard Medical School (USA); Bang-Bon Koo, Boston Univ. (USA). . . . . [9467-20]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 4 . . . . TUE 8:00 AM TO 9:50 AM

Beyond Graphene Layered Materials and Devices

Session Chair: **Thomas George,** ChromoLogic, LLC (USA)

Van der Waals Solids: materials properties, synthesis and device applications *(Invited Paper)*, Anupama B. Kaul, The Univ. of Texas at El Paso (USA) . . . . [9467-21]

Beyond graphene layered materials and devices *(Invited Paper)*, Joshua A. Robinson, The Pennsylvania State Univ. (USA) . . . . [9467-22]

Synthesis, properties, and applications of group IV graphane analogues *(Invited Paper)*, Joshua Goldberger, The Ohio State Univ. (USA) . . . . . . [9467-23]

Phase engineering in 2D materials *(Invited Paper)*, Manish Chhowalla, Rutgers, The State Univ. of New Jersey (USA) . . . . [9467-24]

Challenges and opportunities in 2D crystals: graphene and beyond *(Invited Paper)*, Huili G. Xing, Cornell Univ. (USA) and Univ. of Notre Dame (USA) . . . . [9467-25]

SESSION 5 . . . . TUE 10:20 AM TO 12:30 PM

Graphene and 2D Electronics and Optoelectronics

Session Chair: **Kyung-Ah Son,** HRL Labs., LLC (USA)

2D electronic materials for army applications *(Invited Paper)*, Philip Perconti, U.S. Army Research Lab. (USA) . . . . [9467-26]

Two-dimensional materials synthesis and integration for low power and high frequency devices *(Invited Paper)*, Joshua A. Robinson, Suman Datta, The Pennsylvania State Univ. (USA) . . . . [9467-27]

Increasing the lego of 2D electronics materials: silicene and germanene, graphene's new synthetic cousins *(Invited Paper)*, Guy Le Lay, Aix-Marseille Univ. (France) . . . . [9467-28]

High-speed nanoelectronics based on graphene and beyond *(Invited Paper)*, Shu-Jen Han, IBM Thomas J. Watson Research Ctr. (USA). . . . . [9467-29]

Graphene and beyond: two-dimensional materials for transistor applications *(Invited Paper)*, Frank Schwierz, Technische Univ. Ilmenau (Germany) . . . . [9467-30]

2D materials for high-performance electronic, photonic and sensing applications *(Invited Paper)*, Steven J. Koester, Univ. of Minnesota, Twin Cities (USA) . . . . [9467-31]

Lunch/Exhibition Break . . . . 12:30 pm to 1:30 pm

SESSION 6 . . . . TUE 1:30 PM TO 4:10 PM

Surface Enhanced Spectroscopies for Ultrasensitive Sensing

Session Chair: **Aykutlu Dana,** Bilkent Univ. (Turkey)

Nanotechnology meets biology in the cancer cell *(Invited Paper)*, Mostafa A. El-Sayed, Georgia Institute of Technology (USA) . . . . [9467-32]

Super resolution imaging and SERS *(Invited Paper)*, Katherine A. Willets, The Univ. of Texas at Austin (USA) and Temple Univ. (USA) . . . . [9467-33]

Nanoplasmonic and metamaterials concepts for broadband surface enhanced sensing *(Invited Paper)*, Stefan A. Maier, Imperial College London (United Kingdom). . . . . [9467-34]

A computational look at nano-scale toward giga-pixel nanoscopy *(Invited Paper)*, Aydogan Ozcan, Univ. of California, Los Angeles (USA) . . . . [9467-36]

Opto-electro-mechanical biosensor enabled by graphene *(Invited Paper)*, Ertugrul Cubukcu, Alexander Y. Zhu, Fei Yi, Univ. of Pennsylvania (USA) . . . . [9467-37]

Laser phototherapy: the future of medicine, Terrance L. Baker, Sollay Cosmetic Medical & Laser Ctr. (USA) . . . . [9467-120]

SESSION 7 . . . . TUE 4:10 PM TO 5:30 PM

Novel Nanophotonic Devices, Sensors, and Concepts Based on 2D Materials

Session Chair: **Ertugrul Cubukcu,** Univ. of Pennsylvania (USA)

2D materials and heterostructures for applications in optoelectronics *(Invited Paper)*, Thomas Mueller, Technische Univ. Wien (Austria) . . . . . [9467-38]

Plasmon excitations in low dimensional graphitic materials *(Invited Paper)*, Feng Wang, Univ. of California, Berkeley (USA) . . . . [9467-39]

Optics and optoelectronics of 2D atomic membranes *(Invited Paper)*, Xiaobo Yin, Univ. of Colorado at Boulder (USA) . . . . [9467-40]

Graphene optoelectronic devices for optical communications and imaging *(Invited Paper)*, Dirk R. Englund, Ren-Jye Shiue, Massachusetts Institute of Technology (USA); Yuanda Gao, James Hone, Columbia Univ. (USA). . [9467-41]

Wednesday 22 April

SESSION 8 . . . . WED 8:00 AM TO 10:10 AM

Origami: Where Art, Devices, and Structures Merge

Session Chair: **Richard Vaia,** Air Force Research Lab. (USA)

Origami: folding in nature, art and technology *(Invited Paper)*, Joycelyn S. Harrison, Air Force Office of Scientific Research (USA) . . . [9467-42]

Bringing physics into the fold: Origami-inspired mechanical meta-materials *(Invited Paper)*, Itai Cohen, Cornell Univ. (USA) . . . . [9467-43]

Design tools for adaptive Origami devices *(Invited Paper)*, Philip Buskohl, Kazuko Fuchi, James J. Joo, Greg W. Reich, Richard Vaia, Air Force Research Lab. (USA) . . . . [9467-44]

A novel reconfigurable Origami spiral antenna utilizing 3D printing technologies *(Invited Paper)*, Manos M. Tentzeris, Christy Saintsing, Georgia Institute of Technology (USA) . . . . [9467-45]

popupCAD: a tool for automated design, fabrication, and analysis of laminate micro-devices *(Invited Paper)*, Daniel M. Aukes, Robert J. Wood, Harvard Univ. (USA) and Wyss Institute for Biologically Inspired Engineering (USA) . . . . [9467-46]

Origami compliant mechanisms and deployable space structures *(Invited Paper)*, Larry L. Howell, Spencer P. Magleby, Shannon A. Zirbel, Ezekiel G. Merriam, Brigham Young Univ. (USA); Robert J. Lang, Lang Origami (USA); Brian P. Trease, Jet Propulsion Lab. (USA). . . . . [9467-47]

DEDICATED EXHIBITION TIME AND LUNCH BREAK . . . . 10:10 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 9 . . . . WED 1:00 PM TO 2:50 PM

Micro- and Nano-Sensors and Materials for Oil and Gas Applications

Session Chair: **Joyce Wong,** California Institute of Technology (USA)

Industry-first field trial of inter-well reservoir nanoagent tracers *(Invited Paper)*, Mazen Kanj, Saudi Aramco (Saudi Arabia). . . . . [9467-48]

Application of nanotechnology to drilling fluids: How close are we? *(Invited Paper)*, James E. Friedheim, M-I SWACO (USA). . . . . [9467-49]

Autonomous micro and nano sensors for upstream oil and gas *(Invited Paper)*, David Chapman, The Univ. of Texas at Austin (USA); Walter J. Trybula, The Trybula Foundation, Inc. (USA) . . . . [9467-50]

CMOS methods for the creation of novel sensors for down-hole and surface applications *(Invited Paper)*, Sameer Walavalkar, Chieh-Feng Chang, Axel Scherer, California Institute of Technology (USA) . . . . [9467-51]

Diamond photonics: towards sensing applications in harsh environments *(Invited Paper)*, Marko Loncar, Harvard School of Engineering and Applied Sciences (USA) . . . . [9467-52]

SESSION 10 . . . . WED 3:30 PM TO 5:40 PM

Novel Harsh Environment Sensors for Energy Applications

Joint Session with Conferences 9467 and 9491

Session Chair: **Michael P. Buric,** National Energy Technology Lab. (USA)

Functional sensor material enabled harsh environment, high temperature optical sensors for energy applications *(Invited Paper)*, Paul R. Ohodnicki Jr., National Energy Technology Lab. (USA) . . . . [9467-53]

Ultra-high temperature fiber optical chemical sensors based on nano-porous metal oxides *(Invited Paper)*, Kevin P. Chen, Univ. of Pittsburgh (USA) . . . . [9467-54]

Phosphor-based fiber optic temperature sensors for harsh environments *(Invited Paper)*, Nicholas Djeu, Yutaka Shimoji, MicroMaterials, Inc. (USA) . . . . [9467-55]

Development of Laser induced breakdown spectroscopy (LIBS) sensor to assess groundwater quality impacts *(Invited Paper)*, Dustin McIntyre, Jinesh Jain, Cantwell Carson, Christian Goueguel, National Energy Technology Lab. (USA) . . . . [9467-56]

Temperature dependence of hydrogen related absorption in silica glass optical fibers at high temperatures *(Invited Paper)*, Elizabeth A. Bonnell, Li Yu, Daniel Homa, Virginia Tech Ctr. for Photonics Technology (USA) . . . . . [9467-57]

Analysis of the coupling optical fiber ultrasonic sensor for partial discharges detection, Fengmei F. Li, Yiying Liu, Linjie Wang, Chen Yu, Xi'an Jiaotong Univ. (China) . . . . [9491-15]

Thursday 23 April

SESSION 11 . . . . THU 8:30 AM TO 10:10 AM

MAST: Bio-inspired Control

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Hummingbird flight control under extreme aerodynamic circumstances *(Invited Paper)*, Robert Dudley, Univ. of California, Berkeley (USA) . . . . [9467-58]

A control theoretic approach to neuromorphic computing *(Invited Paper)*, Michael Dorothy, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9467-59]

Bio-inspired sensing and control for disturbance rejection and stabilization *(Invited Paper)*, Gregory Gremillion, James S. Humbert, Univ. of Maryland, College Park (USA) . . . . [9467-60]

High-speed autonomous navigation of unknown environments using learned probabilities of collision *(Invited Paper)*, Charles Richter, Nicholas Roy, Massachusetts Institute of Technology (USA) . . . . [9467-61]

Detecting discrete phenomena using wide field integration methods *(Invited Paper)*, Allison M. Mathis, Joseph K. Conroy, William D. Nothwang, Ryan Robinson, Jared Shamwell, U.S. Army Research Lab. (USA). . . . . [9467-62]

SESSION 12 . . . . THU 10:40 AM TO 12:00 PM

MAST: Scale Legged Locomotion

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Dynamic legged locomotion for palm-size robots *(Invited Paper)*, Ronald Fearing, Duncan Haldane, Univ. of California, Berkeley (USA); David Zarrouk, Ben-Gurion Univ. of the Negev (Israel) . . . . [9467-63]

Metastable legged locomotion in real-world environments: methods to quantify and optimize reliability *(Invited Paper)*, Katie Byl, Cenk O. Saglam, Univ. of California, Santa Barbara (USA). . . . . [9467-64]

Scattering of a legged robot in a heterogeneous granular terrain *(Invited Paper)*, Feifei Qian, Daniel I. Goldman, Georgia Institute of Technology (USA) . . . . [9467-65]

Data driven models of legged locomotion *(Invited Paper)*, Shai Revzen, Univ. of Michigan (USA) . . . . [9467-66]

Lunch/Exhibition Break . . . . Thu 12:00 pm to 1:00 pm

SESSION 13. . . . . THU 1:00 PM TO 2:50 PM

Novel Beam Control Applications and Techniques

Session Chairs: **Christopher C. Wilcox,** U.S. Naval Research Lab. (USA); **Matthew E. L. Jungwirth,** Honeywell Automation & Control Solutions (USA)

Real-time atmospheric imaging and processing with advanced adaptive optics and algorithm acceleration systems *(Invited Paper)*, Jony J. Liu, Leonid A. Beresnev, John E. McElhenny, Gary W. Carhart, U.S. Army Research Lab. (USA); Fouad E. Kiamilev, Univ. of Delaware (USA) . . . . [9467-67]

Ultraspectral imaging and the snapshot advantage *(Invited Paper)*, Michael W. Kudenov, Subharup Gupta Roy, Bryan D. Maione, North Carolina State Univ. (USA) . . . . [9467-68]

Design and characterization of a tunable opto-mechatronic system to mimic the focusing and the regulation of illumination in the formation of images made by the human eye *(Invited Paper)*, Agustín Santiago-Alvarado, Angel S. Cruz-Félix, Arturo Hernández Méndez, Yara Pérez-Maldonado, Cristian Dominguez Osante, Univ. Tecnológica de la Mixteca (Mexico) . . . . [9467-69]

Selective broadband jitter mitigation for non-common path errors *(Invited Paper)*, Edwin S. Ahn, Richard A. Carreras, Air Force Research Lab. (USA); Steve Gibson, Univ. of California, Los Angeles (USA) . . . . [9467-70]

Beam optimization for imaging lidar *(Invited Paper)*, Lyle Ruppert, Ball Aerospace & Technologies Corp. (USA) . . . . [9467-71]

CONFERENCE 9467

SESSION 14 . . . . THU 3:20 PM TO 5:00 PM

Photonics Research at SPAWAR

Session Chair: **Ryan P. Lu,**
Space and Naval Warfare Systems Command (USA)

Photonic RF-IF wideband down conversion using optical injection locking *(Invited Paper)*, James R. Adleman, SPAWAR Systems Ctr. (USA); Chunyan Lin, Space and Naval Warfare Systems Command (USA); Shai Barak Jester, B. Melvin L. Pascoguin, Douglass Evans, SPAWAR Systems Ctr. (USA); Everett W. Jacobs, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9467-72]

Wideband RF channelizer based on parametric combs *(Invited Paper)*, Sanja Zlatanovic, Space and Naval Warfare Systems Command (USA) . . . . . [9467-73]

Optical channel characterization in maritime atmospheres *(Invited Paper)*, Stephen M. Hammel, Dimitri Tsintikidis, John S. deGrassie, Colin Reinhardt, Kevin M. McBryde, Eric Hallenborg, David T. Wayne, Kristofor Gibson, Galen Cauble, Ana Ascencio, Joshua J. Rudiger, Space and Naval Warfare Systems Command (USA) . . . . [9467-74]

Wavelength optimization via retroreflection for underwater free-space optical communication *(Invited Paper)*, Burton Neuner III, B. Melvin L. Pascoguin, SPAWARSYSCEN Pacific: San Diego (USA) . . . . [9467-75]

Preparation of novel HTS films and tunnel junctions for advanced C3I sensor applications *(Invited Paper)*, Benjamin J. Taylor, Teresa H. Emery, Susan A. E. Berggren, Anna M. Leese de Escobar, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9467-76]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Lowering contact resistance of graphene FETs with capacitive extension of ohmic contacts for enhanced RF performance, Chowdhury G. Al-Amin, Mustafa Karabiyik, Raju Sinha, Nezih Pala, Florida International Univ. (USA) . . . . [9467-103]

Development of small-sized accelerometer, Sergey P. Timoshenkov, Andrey Mikheev, Alexey Timoshenkov, National Research Univ. of Electronic Technology (Russian Federation) . . . . [9467-104]

Comb structure analysis of the capacitive sensitive element in MEMS-accelerometer, Sergey P. Timoshenkov, Andrey Shalimov, Mikhail Golovinskiy, National Research Univ. of Electronic Technology (Russian Federation) . . . . [9467-105]

A bimorph electrothermal actuator for micromirror devices, Sergey Evstafyev, Sergey P. Timoshenkov, Igor Britkov, National Research Univ. of Electronic Technology (Russian Federation) . . . . [9467-106]

A novel class of MEMS accelerometers for guidance and control of gun-fired munitions, Jahangir Rastegar, Dake Feng, Omnitek Partners, LLC (USA); Carlos M. Pereira, U.S. Army Armament Research, Development and Engineering Ctr. (USA). . . . . [9467-108]

Fiber-based split-ring-resonators: producing strong magnetic response in the IR through an electrospinning technique, Tao Gong, Jeremy N. Munday, Univ. of Maryland, College Park (USA) . . . . [9467-109]

Thermal conductivity characterization of in-situ fabricated polysilicon nanowires for uncooled thermoelectric infrared detectors, Mohammad J. Modarres-Zadeh, Univ. of Central Florida (USA); Nahida Akhter, Intel Corp. (USA); Reza Abdolvand, Univ. of Central Florida (USA) . . . . [9467-110]

Two-photon absorption based optical logic, Xiang Zhang, Wenbo Li, Hongyu Hu, Niloy K. Dutta, Univ. of Connecticut (USA). . . . . [9467-111]

Mode-locked fiber ring laser using graphene as saturable absorber, Hongyu Hu, Xiang Zheng, Wenbo Li, Niloy K. Dutta, Univ. of Connecticut (USA) . . . . [9467-112]

Characterization of planar 6×6 cm2 MCP-based picosecond photo-detectors, Jingbo Wang, Karen Byrum, Marcel Demarteau, Edward A. May Jr., Robert G. Wagner, Dean Walters, Lei Xia, Junqi Xie, Huyue Zhao, Argonne National Lab. (USA) . . . . [9467-113]

Surface depletion mediated quantum dots, Walter R. Buchwald, Yeshaya Koblick, Univ. of Massachusetts Boston (USA) . . . . [9467-114]

Sensors application using microcontroller, Huthaifa A. Al Issa, Univ. of Dayton (USA) . . . . [9467-115]

Super resolution infrared light field imaging using single carbon nanotube detector, Ning Xi, Michigan State Univ. (USA) . . . . [9467-116]

High mobility single-crystalline-like semiconductor thin films on flexible metal substrates, Venkat Selvamanickam, Pavel Dutta, Ying Gao, Yao Yao, Monika Rathi, Univ. of Houston (USA) . . . . [9467-119]

Friday 24 April

SESSION 15 . . . . FRI 8:00 AM TO 8:30 AM

Keynote Session

Session Chair: **Michael K. Rafailov**

High power lasers for infrared countermeasures, targeting and illumination, beacons and standoff detection of explosives and CWAs *(Invited Paper)*, C. Kumar N. Patel, Pranalytica, Inc. (USA) . . . . [9467-77]

SESSION 16 . . . . FRI 8:30 AM TO 9:50 AM

Ultra-fast Bandgap Photonics

Session Chair: **Michael K. Rafailov**

Detector response to high repetition rate ultra-short laser pulses *(Invited Paper)*, Jason M. Auxier, U.S. Naval Research Lab. (USA); Myron P. Pauli, Naval Research Laboratory (USA); Michael K. Rafailov, DHPC Technologies (USA) and Univ. of Alberta (Canada); Michael K. Rafailov, DHPC Technologies, Inc (USA) . . . . [9467-78]

2-micron ultra-short pulse lasers *(Invited Paper)*, Shibin Jiang, AdValue Photonics, Inc. (USA) . . . . [9467-79]

Ultrafast fiber lasers: practical applications *(Invited Paper)*, Igor Pastirk, TOPTICA Photonics Inc. (USA); Alexander Sell, Robert Herda, Andreas Brodschelm, Armin Zach, TOPTICA Photonics AG (Germany). . . . . [9467-80]

Plasmonic nanoantennas for enhanced midwave and longwave infrared imaging *(Invited Paper)*, David W. Peters, Thomas E. Beechem III, Stephen W. Howell, Jin K. Kim, Darin Leonhardt, Joel R. Wendt, John A. Montoya, Sandia National Labs. (USA) . . . . [9467-81]

SESSION 17. . . . . FRI 10:20 AM TO 12:20 PM

THz Photonics

Session Chair: **Michael K. Rafailov**

Terahertz electronics for sensing and imaging applications *(Invited Paper)*, Michael Shur, Rensselaer Polytechnic Institute (USA) . . . . [9467-82]

A compact THz imaging set-up at 750 microns *(Invited Paper)*, Linda E. Marchese, Marc Terroux, Alain Bergeron, INO (Canada) . . . . [9467-83]

Collection Efficiency for Millimeter and Submillimeter Wave Antenna-coupled DetectionCollection efficiency for millimeter and submillimeter wave antenna-Collection efficiency for millimeter and submillimeter wave antenna-coupled detection *(Invited Paper)*, Brian A. Lail, Yuancheng Xu, Florida Institute of Technology (USA) . . . . [9467-84]

CMOS mm-wave system-on-chip for sensing and communication *(Invited Paper)*, Adrian J. Tang, Jet Propulsion Lab. (USA) and Univ. of California, Los Angeles (USA) . . . . [9467-85]

Applications and challenges for MMW and THz sensors *(Invited Paper)*, John N. Sanders-Reed, The Boeing Co (USA) . . . . [9467-86]

Video rate imaging at 1.5 THz via frequency upconversion to the near-IR *(Invited Paper)*, Patrick F. Tekavec, Vladimir G. Kozlov, Ian McNee, Microtech Instruments, Inc. (USA); Yun-Shik Lee, Oregon State Univ. (USA); Konstantin L. Vodopyanov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9467-87]

Lunch Break . . . . 12:20 pm to 1:30 pm

SESSION 18 . . . . FRI 1:30 PM TO 3:10 PM

Mid-IR Laser Photonics

Session Chair: **Michael K. Rafailov**

Solution-processed chalcogenide glass: a pathway toward novel materials and architectures for mid-IR photonics *(Invited Paper)*, Craig B. Arnold, TAG Optics, Inc. (USA) . . . . [9467-88]

Approaches to generation of tunable mid-IR ultrafast pulses with fiber sources *(Invited Paper)*, Alexander Sell, TOPTICA Photonics AG (Germany); Igor Pastirk, TOPTICA Photonics Inc. (USA); Alexander Sell, Andreas Brodschelm, Robert Herda, TOPTICA Photonics AG (Germany); Thomas Puppe, TOPTICA Photonics Inc. (Germany); Armin Zach, TOPTICA Photonics AG (Germany) . . . . . [9467-89]

Long wavelength mid-infrared from mixing two colors from a fiber amplifier *(Invited Paper)*, Donna Strickland, Univ. of Waterloo (Canada). . . . . [9467-90]

Mid-infrared ultrafast fiber laser *(Invited Paper)*, Peng Wan, Lih-Mei Yang, Jian Liu, PolarOnyx, Inc. (USA) . . . . [9467-91]

Mid-IR lasers based on transition metal doped II-VI semiconductors *(Invited Paper)*, Sergey B. Mirov, The Univ. of Alabama at Birmingham (USA) and IPG Photonics - Mid-Infrared Lasers (USA); Vladimir V. Fedorov, Dmitry V. Martyshkin, The Univ. of Alabama at Birmingham (USA); Igor S. Moskalev, Mike B. Mirov, Sergey Vasilyev, IPG Photonics - Mid-Infrared Lasers (USA); Valentin P. Gapontsev, IPG Photonics Corp. (USA) . . . . [9467-92]

SESSION 19 . . . . FRI 3:30 PM TO 4:00 PM

Quantum Cascade Lasers and Spectroscopy

Session Chair: **Michael K. Rafailov**

Quantum cascade laser frequency combs for spectroscopy *(Invited Paper)*, Jérôme Faist, ETH Zürich (Switzerland) . . . . [9467-93]

SESSION 20 . . . . FRI 4:00 PM TO 6:00 PM

Laser Chemical Detection

Joint Session with Conferences 9467, 9455, 9486

Session Chair: **Michael K. Rafailov,** The Reger Group (USA)

Broadband mid-IR frequency comb source for standoff chemical detection *(Invited Paper)*, Konstantin L. Vodopyanov, CREOL, The College of Optics and Photonics, Univ. of Central Florida (USA) . . . . [9467-94]

Standoff trace detection of explosives with Infrared hyperspectral imagery *(Invited Paper)*, Frank Fuchs, Stefan Hugger, Jan-Philip Jarvis, Quankui K. Yang, Ralf Ostendorf, Christian Schilling, Wolfgang Bronner, Raschid Driad, Rolf Aidam, Joachim Wagner, Fraunhofer-Institut für Angewandte Festkörperphysik (Germany) . . . . [9467-95]

Spectral shifted background references for QCL based mid infrared standoff spectroscopy *(Invited Paper)*, Charles W. Van Neste, Thomas G. Thundat, Univ. of Alberta (Canada) . . . . [9467-96]

Toward the realization of a compact chemical sensor platform using quantum cascade lasers *(Invited Paper)*, Ellen L. Holthoff, Paul M. Pellegrino, Logan S. Marcus, U.S. Army Research Lab. (USA) . . . . [9467-97]

Detection of trace explosives on relevant substrates using a mobile platform for photothermal infrared imaging spectroscopy (PT-IRIS) *(Invited Paper)*, Christopher A. Kendziora, Robert Furstenberg, Michael R. Papantonakis, Viet Nguyen, Jeff M. Byers, R. Andrew McGill, U.S. Naval Research Lab. (USA) . . . . [9467-98]

Standoff detection of chemical and biological threats using miniature widely tunable QCLs *(Invited Paper)*, Petros Kotidis, Erik R. Deutsch, Anish K. Goyal, Block Engineering, LLC (USA) . . . . [9467-99]

SESSION 21 . . . . FRI 6:00 PM TO 7:00 PM

Quantum Cascade Lasers

Joint Session with Conferences 9467, 9455, 9486

Session Chair: **Michael K. Rafailov,** The Reger Group (USA)

Recent progress in quantum cascade external cavity laser systems optimized for mid-IR sensing applications *(Invited Paper)*, David B. Arnone, Leigh J. Bromley, David B. Caffey, William B. Chapman, Timothy Day, Allen Priest, Daylight Solutions Inc. (USA); Charles C. Harb, The Univ. of New South Wales (Australia) . . . . [9467-100]

Recent results on performance optimization of QCLs for consumption, spectral coverage and power *(Invited Paper)*, Antoine Müller, Richard Maulini, Stéphane Blaser, Alfredo Bismuto, Tobias Gresch, Romain Terazzi, Alpes Lasers SA (Switzerland) . . . . [9467-101]

High power MWIR quantum cascade lasers and their use in intra-cavity THz room temperature generation *(Invited Paper)*, Mariano Troccoli, AdTech Optics, Inc. (USA) . . . . [9467-102]

CONFERENCE 9468

Tuesday–Thursday 21–23 April 2015 • Proceedings of SPIE Vol. 9468

Unmanned Systems Technology XVII

Conference Chairs: **Robert E. Karlsen,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA); **Douglas W. Gage,** XPM Technologies (USA); **Charles M. Shoemaker,** U.S. Army Communications-Electronics Research Development and Engineering Command (USA); **Grant R. Gerhart,** U.S. Army Tank-Automotive Research, Development, and Engineering Ctr.-Retired (USA)

Program Committee: **Jonathan A. Bornstein,** U.S. Army Research Lab. (USA); **Jared Giesbrecht,** Defence Research and Development Canada, Suffield (Canada); **Frank L. Lewis,** The Univ. of Texas at Arlington (USA); **Larry H. Matthies,** Jet Propulsion Lab. (USA); **Camille S. Monnier,** Charles River Analytics, Inc. (USA); **Paul L. Muench,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA); **Hoa G. Nguyen,** Space and Naval Warfare Systems Ctr. Pacific (USA); **James L. Overholt,** Air Force Research Lab. (USA); **Mike Perschbacher,** RovnoTech (USA); **Anthony Stentz,** Carnegie Mellon Univ. (USA); **Gary Witus,** Turing Associates, Inc. (USA); **Brian M. Yamauchi,** iRobot Corp. (USA)

Tuesday 21 April

SESSION 1. . . . . TUE 1:00 PM TO 3:00 PM

Perception and Human Robot Interaction

Session Chairs: **Camille S. Monnier,** Charles River Analytics, Inc. (USA); **Hoa G. Nguyen,** Space and Naval Warfare Systems Ctr. Pacific (USA)

Multi-modal interaction for UAS control, Glenn Taylor, Ben Purman, Paul Schermerhorn, Guillermo Garcia-Sampedro, Robert Hubal, Soar Technology, Inc. (USA); Kathleen Crabtree, Booz Allen Hamilton Inc. (USA) . . . . [9468-1]

A novel method for full position and angular orientation measurement of moving objects, Harbans S. Dhadwal, Jahangir Rastegar, Dake Feng, Philip Kwok, Omnitek Partners, LLC (USA). . . . . [9468-2]

Towards contextual awareness in robot mapping: extracting semantic hierarchy from point cloud data, Carlos P. Nieto-Granda, Siddharth Choudhary, Georgia Institute of Technology (USA); John G. Rogers III, Jeffrey N. Twigg, U.S. Army Research Lab. (USA); Varun Murali, Henrik I. Christensen, Georgia Institute of Technology (USA) . . . . [9468-3]

Natural interaction for unmanned systems, Glenn Taylor, Soar Technology, Inc. (USA). . . . . [9468-4]

Fusion of lidar and radar for detection of partially obscured objects, Jim Hollinger, Brett Kutscher, LSA Autonomy LLC (USA); Ryan R. Close, U.S. Army RDECOM CERDEC NVESD (USA) . . . . [9468-5]

3D environment modeling on uneven-terrain using 3D LIDAR and IMU for unmanned ground system, Kuk Cho, Korea Institute of Industrial Technology (Korea, Republic of); Muhammad Ilyas, Univ. of Science and Technology (Korea, Republic of); SeungHo Baeg, Sangdeok Park, Korea Institute of Industrial Technology (Korea, Republic of) . . . . [9468-6]

SESSION 2 . . . . TUE 3:30 PM TO 5:10 PM

Robotics CTA

Session Chairs: **Jonathan A. Bornstein;** U.S. Army Research Lab. (USA); **Dilip G. Patel,** General Dynamics Research Systems (USA)

Motion compensation for structured light sensors, Christoph Mertz, Debjani Biswas, Carnegie Mellon Univ. (USA) . . . . [9468-7]

Active dictionary learning for image representation, Tong Wu, Anand Sarwate, Waheed U. Bajwa, Rutgers, The State Univ. of New Jersey (USA) . . . . [9468-8]

RCTA capstone assessment, Craig Lennon, Barry Bodt, U.S. Army Research Lab. (USA); Richard Camden, Engility Corp. (USA); Charles A. DiBerardino, General Dynamics Robotic Systems (USA); Marshal Childers, U.S. Army Research Lab. (USA) . . . . [9468-9]

Semi-autonomous exploration of multi-floor buildings with a legged robot, Garrett J. Wenger, Aaron M. Johnson, Camillo J. Taylor, Daniel E. Koditschek, Univ. of Pennsylvania (USA) . . . . [9468-10]

Stabilization and agility quantification of a flexible-spine bounding quadruped model, Katie Byl, Nadim Sarham, Tom Strizic, Chia-Chi Wu, Univ. of California, Santa Barbara (USA); Jason L. Pusey, U.S. Army Research Lab. (USA) . . . . [9468-11]

Wednesday 22 April

SESSION 3 . . . . WED 8:30 AM TO 10:30 AM

Self-organizing Collaborative Unmanned ISR Teams I

Joint Session with Conferences 9479 and 9468

Session Chairs: **Raja Suresh,** General Dynamics Advanced Information Systems (USA); **Robert E. Karlsen,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA)

DARPA perspective on open architectures *(Invited Paper)*, John Shaw, Defense Advanced Research Projects Agency (USA). . . . . [9479-14]

Open mission system overview *(Invited Paper)*, Eric Koper, U.S. Air Force (USA) . . . . [9479-15]

Overview of DARPA CODE program *(Invited Paper)*, Jean-Charles Lede, Defense Advanced Research Projects Agency (USA). . . . . [9479-16]

Open architecture flexible weapons *(Invited Paper)*, Jonathan Shaver, Air Force Research Lab. (USA). . . . . [9479-17]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:30 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 4 . . . . WED 1:00 PM TO 3:10 PM

Self-organizing, Collaborative Unmanned ISR Teams II

Joint Session with conferences 9479 and 9468

Session Chairs: **Raja Suresh,** General Dynamics Advanced Information Systems (USA); **Robert E. Karlsen,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA)

Executable architecture management system *(Invited Paper)*, Jeff Monroe, Metron, Inc. (USA) . . . . [9479-18]

UAV field demonstration of social media enabled tactical data link, Christopher C. Olson, Andrew J. Newman, Da Xu, Sean R. Martin, Jonathan C. Castelli, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . . . . [9468-12]

Fuel Cell powered small unmanned aerial systems (UASs) for extended endurance, Deryn D. Chu, Zachary Dunbar, Rongzhong Jiang, U.S. Army Research Lab. (USA) . . . . [9468-13]

Tactical 3D model generation using structure-from-motion on video from unmanned systems, Joshua D. Harguess, Mark Bilinski, Kim B. Nguyen, Darren N. Powell, Susie Alderson, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-14]

Aircraft path planning for optimal imaging using dynamic cost functions, Gordon Christie, Haseeb R. Chaudhry, Kevin Kochersberger, Virginia Polytechnic Institute and State Univ. (USA) . . . . [9468-15]

UxV to the cloud via widgets, Michael August, Darren N. Powell, Charles Yetman, Kim B. Nguyen, Joshua D. Harguess, Mark Bilinski, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-16]

SESSION 5 . . . . WED 3:40 PM TO 6:00 PM

Special Topics

Session Chairs: **Douglas W. Gage,** XPM Technologies (USA); **Charles M. Shoemaker,** U.S. Army Communications-Electronics Research Development and Engineering Command (USA)

Construction robots for Mars, Douglas W. Gage, XPM Technologies (USA) . . . . [9468-17]

Research for a multi-modal mobility and manipulation propulsion core, Harris L. Edge, U.S. Army Research Lab. (USA). . . . . [9468-18]

Automatic pose sensing for an IED-detecting dog, Hoa G. Nguyen, Adam F. Nans, Kurt A. Talke, Paul Candela, H. R. Everett, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-19]

Incremental learning in trust-based vehicle control, Dariusz G. Mikulski, Robert E. Karlsen, U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA). . . . . [9468-20]

Differences in cyber security considerations for remotely piloted and autonomous unmanned aerial vehicles, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9468-21]

Design and experimental validation of a simple controller for a multi-segment magnetic crawler robot, Leah Kelley, Massachusetts Institute of Technology (USA); Saam Ostovari, Aaron B. Burmeister, Kurt A. Talke, Narek Pezeshkian, Hoa G. Nguyen, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-22]

The role of C4ISR (command, control, communications, computers, intelligence, surveillance and reconnaissance) in expedited deployment of autonomous UGV's, Charles M. Shoemaker, U.S. Army Communications-Electronics Research Development and Engineering Command (CERDEC) (USA) . . . . [9468-23]

Thursday 23 April

SESSION 6 . . . . THU 8:30 AM TO 10:10 AM

MAST: Bio-inspired Control

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Hummingbird flight control under extreme aerodynamic circumstances *(Invited Paper)*, Robert Dudley, Univ. of California, Berkeley (USA) . . . . [9467-58]

A control theoretic approach to neuromorphic computing *(Invited Paper)*, Michael Dorothy, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9467-59]

Bio-inspired sensing and control for disturbance rejection and stabilization *(Invited Paper)*, Gregory Gremillion, James S. Humbert, Univ. of Maryland, College Park (USA) . . . . [9467-60]

High-speed autonomous navigation of unknown environments using learned probabilities of collision *(Invited Paper)*, Charles Richter, Nicholas Roy, Massachusetts Institute of Technology (USA) . . . . [9467-61]

Detecting discrete phenomena using wide field integration methods *(Invited Paper)*, Allison M. Mathis, Joseph K. Conroy, William D. Nothwang, Ryan Robinson, Jared Shamwell, U.S. Army Research Lab. (USA) . . . . [9467-62]

SESSION 7 . . . . THU 10:40 AM TO 12:00 PM

MAST: Scale Legged Locomotion

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Dynamic legged locomotion for palm-size robots *(Invited Paper)*, Ronald Fearing, Duncan Haldane, Univ. of California, Berkeley (USA); David Zarrouk, Ben-Gurion Univ. of the Negev (Israel) . . . . [9467-63]

Metastable legged locomotion in real-world environments: methods to quantify and optimize reliability *(Invited Paper)*, Katie Byl, Cenk O. Saglam, Univ. of California, Santa Barbara (USA). . . . . [9467-64]

Scattering of a legged robot in a heterogeneous granular terrain *(Invited Paper)*, Feifei Qian, Daniel I. Goldman, Georgia Institute of Technology (USA) . . . . [9467-65]

Data driven models of legged locomotion *(Invited Paper)*, Shai Revzen, Univ. of Michigan (USA) . . . . [9467-66]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Open Space Box: communication to support big data in orbit, Atif F. Mohammad, Jeremy Straub, Univ. of North Dakota (USA) . . . . . [9468-24]

Stealth Technology: the potential to make the visible, invisible, Laura Samso Pericon, Consultant (Spain). . . . . [9468-25]

Kestrel vidar, Simon Olsen, Sentient Vision Systems Pty Ltd. (Australia). . . . . [9468-26]

CONFERENCE 9469

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9469

Sensors and Systems for Space Applications VIII

Conference Chairs: **Khanh D. Pham,** Air Force Research Lab. (USA); **Genshe Chen,** Intelligent Fusion Technology, Inc. (USA)

Program Committee: **Joseph L. Cox,** Missile Defense Agency (USA); **Erik P. Blasch,** Air Force Research Lab. (USA); **Trevor J. Bihl,** Air Force Institute of Technology (USA); **Brien Flewelling,** Air Force Research Lab. (USA); **Thomas George,** ChromoLogic (USA); **Richard T. Howard,** NASA Marshall Space Flight Ctr. (USA); **Brian K. McComas,** Raytheon Missile Systems (USA); **Jeremy Murray-Krezan,** Air Force Research Lab. (USA); **Tien M. Nguyen,** The Aerospace Corp. (USA); **Andre Samberg,** Sec-Control Finland Ltd. (Finland); **Robert SiVilli,** Air Force Research Lab. (USA); **Ryan M. Weisman,** Air Force Research Lab. (USA); **Henry Zmuda,** Univ. of Florida (USA)

Monday 20 April

SESSION 1. . . . . MON 8:30 AM TO 11:20 AM

Space Payload Technologies

Session Chairs: **Brien R. Flewelling,** Air Force Research Lab. (USA); **Joseph L. Cox,** Missile Defense Agency (USA)

Correction of active space telescope mirror using woofer-tweeter adaptive optics, Matthew R. Allen, Jae Jun Kim, Brij N. Agrawal, Naval Postgraduate School (USA) . . . . [9469-1]

Adaptive, realtime spectral imaging system with a digitally programmable matched filter function, J. Daniel Newman, Andrew P. Sacco, Angela M. D'Orazio, Eskander Ensafi, Exelis Geospatial Systems (USA); Yves Conturie, Exelis Inc. (USA); Steven Chien, Jet Propulsion Lab. (USA); Marek Kowarz, MicroAdventure Technologies LLC (USA); Paul P. K. Lee, George S. Brown, Exelis Geospatial Systems (USA); Ralph C. Short, Jeffrey Czajka, ITT Exelis (USA) . . . . [9469-2]

Characterizing point spread function fluctuations to improve resident space object detection, Tyler Hardy, Stephen C. Cain, Air Force Institute of Technology (USA) . . . . [9469-3]

High-resolution infrared detector and its electronic unit for space application, Mustapha Meftah, LATMOS (France). . . . . [9469-4]

Anomalous cases of astronaut helmet detection, Chester Dolph, NASA Langley Research Ctr. (USA) and Old Dominion Univ. (USA); Andrew J. Moore, NASA Langley Research Ctr. (USA); Matt Schubert, NASA Langley Research Ctr. (USA) and Christopher Newport Univ. (USA); Glenn Woodell, NASA Langley Research Ctr. (USA) . . . . [9469-5]

Program technical baseline framework for future space systems: a combined DoD acquisition, OSA and integrated program management perspective *(Invited Paper)*, Tien M. Nguyen, Andy T. Guillen, Sumner S. Matsunaga, The Aerospace Corp. (USA) . . . . [9469-6]

SESSION 2 . . . . MON 11:20 AM TO 12:00 PM

Cyber Physical System

Session Chairs: **Richard T. Howard,** NASA Marshall Space Flight Ctr. (USA); **Wei Yu,** Towson Univ. (USA)

Towards an integrated defense system for cyber security situation awareness, Hanlin Zhang, Zhijiang Chen, Wei Yu, Towson Univ. (USA); Sixiao Wei, Dan Shen, Genshe Chen, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Erik Blasch, Air Force Research Lab. (USA). . . . . [9469-7]

Internet threat monitoring (ITM) against localization attack using random delay addition, Sixiao Wei, Dan Shen, Intelligent Fusion Technology, Inc. (USA); Wei Yu, Chao Lu, Towson Univ. (USA); Erik Blasch, Khanh Pham, Air Force Research Lab. (USA); Genshe Chen, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-8]

Lunch Break . . . . .Mon 12:00 pm to 1:30 pm

SESSION 3 . . . . MON 1:30 PM TO 3:10 PM

Protected SATCOM and SatOP

Session Chairs: **Zhonghai Wang,** Intelligent Fusion Technology, Inc. (USA); **Xi Zhang,** Texas A&M Univ. (USA)

Quantum key distribution for QoS guarantee in satellite networks, Ping Wang, Xi Zhang, Texas A&M Univ. (USA); Genshe Chen, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Erik Blasch, Air Force Research Lab. (USA) . . . . [9469-9]

A probabilistic reasoning approach for communications satellite situational awareness, Todd Martin, Kuochu C. Chang, George Mason Univ. (USA); Xin Tian, Genshe Chen, Intelligent Fusion Technology, Inc. (USA). . . . . [9469-10]

Multi-carrier transmission for hybrid radio frequency with optical wireless communications, Gang Wang, Genshe Chen, Dan Shen, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Erik Blasch, Air Force Research Lab. (USA); Tien Nguyen, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-11]

RFI modeling and prediction approach for SATOP applications, Tien M. Nguyen, The Catholic Univ. of America (USA); Hien T. Tran, North Carolina State Univ. (USA); Zhonghai Wang, Genshe Chen, Gang Wang, Intelligent Fusion Technology, Inc. (USA); Steven A. Lane, Khanh Pham, Air Force Research Lab. (USA) . . . . [9469-12]

A TDMA MIMO SAR radar for automated position-keeping, Zhonghai Wang, Xingping Lin, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Erik Blasch, Air Force Research Lab. (USA); Genshe Chen, Dan Shen, Bin Jia, Gang Wang, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-13]

SESSION 4 . . . . MON 3:40 PM TO 4:40 PM

Positioning, Navigation, and Tracking

Session Chairs: **Trevor J. Bihl,** Air Force Institute of Technology (USA); **Bin Jia,** Intelligent Fusion Technology, Inc. (USA)

A benchmark for vehicle detection on wide area motion imagery, Joseph Catrambone, Ismail Amzovski, Temple Univ. (USA); Erik Blasch, Carolyn Sheaff, Air Force Research Lab. (USA); Genshe Chen, Intelligent Fusion Technology, Inc. (USA); Haibin Ling, Temple Univ. (USA). . . . . [9469-14]

Multi-target detection and estimation with the use of massive independent identical sensors, Tiancheng Li, Univ. de Salamanca (Spain) and Northwestern Polytechnical Univ. (China); Juan M. Corchado, Univ. de Salamanca (Spain); Javier Bajo, Univ. Politécnica de Madrid (Spain); Genshe Chen, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-15]

A suborbital IMU test mission, Adam R. Lawman, Jeremy Straub, Scott Kerlin, Univ. of North Dakota (USA) . . . . [9469-16]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 5 . . . . TUE 8:00 AM TO 11:10 AM

Space Situational Awareness

Session Chairs: **Erik Blasch,** Air Force Research Lab. (USA); **Dan Shen,** Intelligent Fusion Technology, Inc. (USA)

Review of game theory applications for situation awareness, Erik Blasch, Air Force Research Lab. (USA); Dan Shen, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Air Force Research Lab. (USA); Genshe Chen, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-17]

Pursuit-evasion games with information uncertainties for elusive orbital maneuver and space object tracking, Dan Shen, Bin Jia, Genshe Chen, Intelligent Fusion Technology, Inc. (USA); Erik Blasch, Khanh Pham, Air Force Research Lab. (USA) . . . . [9469-18]

Distributed sensor management for space situational awareness via a negotiation game, Bin Jia, Dan Shen, Intelligent Fusion Technology, Inc. (USA); Khanh Pham, Erik Blasch, Air Force Research Lab. (USA); Genshe Chen, Intelligent Fusion Technology, Inc. (USA) . . . . [9469-19]

Size distribution for orbital debris measured with the NASA-WISE Instrument, Jeremy Murray-Krezan, Air Force Research Lab. (USA) . . [9469-20]

Enabling direct feedback between initial orbit determination and sensor data processing for detection and tracking of space objects, Brien R. Flewelling, Air Force Research Lab. (USA); Bradley Sease, Virginia Polytechnic Institute (USA); Timothy S. Murphy, Georgia Institute of Technology (USA) . . . . [9469-21]

Space situational awareness applications for radio astronomy assets, Galen Watts, National Radio Astronomy Observatory (USA); John M. Ford, National Radio Astronomy Obseravtory (USA); H. Alyson Ford, National Radio Astronomy Observatory (USA) . . . . [9469-22]

The Joint Space Operations Center (JSpOC) Mission System (JMS) and Advanced Research, Collaboration, and Application Development Environment (ARCADE): a test bed for space situational awareness algorithms *(Invited Paper)*, Jeremy Murray-Krezan, Air Force Research Lab. (USA) . . . . [9469-23]

SESSION 6 . . . . TUE 11:10 AM TO 12:10 PM

Processing and Exploitation

Session Chairs: **Jeremy Murray-Krezan,** Air Force Research Lab. (USA); **Ryan M. Weisman,** Air Force Research Lab. (USA)

Economic analysis of open space box model utilization in space craft, Atif F. Mohammad, The Univ. of North Dakota (USA); Jeremy Straub, Univ. of North Dakota (USA). . . . . [9469-24]

The effects of developments in the stealth technology, passive radars and optic sensors on the future, Asim Göktas, Turkish War College (Turkey) . . . . [9469-25]

The Thermal Infrared Compact Imaging Spectrometer (TIRCIS): a follow-on to the Space Ultra-Compact Hyperspectral Imager, Sarah T. Crites, Robert Wright, Paul G. Lucey, Jeremy Chan, Harold Garbeil, Amber Imai, Eric J. Pilger, Mark Wood, L. Yoneshige, Univ. of Hawai'I (USA) . . . . [9469-26]

SEE WEB FOR UPDATES
www.spie.org/dss15program

CONFERENCE 9470A

Wednesday–Thursday 22–23 April 2015 • Part of Proceedings of SPIE Vol. 9470

Display Technologies and Applications for Defense, Security, and Avionics IX

Conference Chairs: **Daniel D. Desjardins,** Consultant (USA); **Kalluri R. Sarma,** Honeywell Technology (USA)

Program Committee: **Masoud Ali,** Barco, Inc. (USA); **Hari M. Atkuri,** BEAM Engineering for Advanced Measurements Co. (USA); **Philip J. Bos,** Kent State Univ. (USA); **Alexander A. Cameron,** BAE Systems (United Kingdom); **Reginald Daniels,** Air Force Research Lab. (USA); **Timothy J. Edwards,** Kopin Corp. (USA); **Jean-Michel Francois,** Thales Avionics S.A. (France); **Gary W. Jones,** NanoQuantum Sciences, Inc. (USA); **Charles J. Lloyd,** Visual Performance, LLC (USA); **John P. McIntire,** Air Force Research Lab. (USA); **Raymond Schulze,** U.S. Army CERDEC CP&I Directorate (USA); **Joe Tchon,** Rockwell Collins, Inc. (USA); **Paul L. Wisely,** Holoeye Systems (USA)

Wednesday 22 April

SESSION 1. . . . . WED 3:30 PM TO 4:50 PM

Head and Helmet Mounted Displays and Display Technologies and Applications for Defense, Security, and Avionics

Joint Session with Conferences 9470A and 9470B

Session Chair: **Peter L. Marasco,** Air Force Research Lab. (USA)

Diver's full face mask head-up display using waveguide optical display technology, Dennis Gallagher, Richard Manley, Naval Surface Warfare Ctr. Panama City Div. (USA). . . . . [9470-1]

The impact of coloured symbology on cockpit eyes-out display effectiveness: a survey of key parameters, Maha Fares, Derek R. Jordan, BAE Systems (United Kingdom) . . . . [9470-35]

Augmented reality technology for heads-up, day/night situational awareness for the dismounted soldier, Eric Gans, Applied Research Associates, Inc. (USA). . . . . [9470-2]

Operational feedback on night vision with hyperstereoscopic HMD, Jean-Michel Francois, Thales Avionics S.A. (France); Daniel Maulet, Thales Angénieux S.A. (France); Joel Baudou, Thales Avionics S.A. (France) . . . [9470-3]

Thursday 23 April

SESSION 2 . . . . THU 8:00 AM TO 9:30 AM

Head-Mounted and Body-Worn Displays

Session Chair: **Kalluri R. Sarma,** Honeywell Technology (USA)

Review and current status of head-mounted display technologies *(Invited Paper)*, Hong Hua, College of Optical Sciences, The Univ. of Arizona (USA) . . . . [9470-4]

Keeping display visibility in outdoor environment, Ariela Donval, Ido E. Dotan, Noam Gross, Eran Partouche, Ofir Lipman, Moshe Oron, KiloLambda Technologies, Ltd. (Israel) . . . . [9470-5]

Investigation of the benefits of utilizing lidar-based data on wearable mobile computing platforms, Vince Schmidt, George A. Reis, Air Force Research Lab. (USA); Charlton Anderson, The Design Knowledge Co. (USA) . . . . [9470-6]

Wearable android controller for a telescope observatory system, Vince Schmidt, John Ianni, Air Force Research Lab. (USA) . . . . [9470-7]

SESSION 3 . . . . THU 9:30 AM TO 10:10 AM

Stereoscopic 3D Displays

Session Chair: **Reginald Daniels,** Air Force Research Lab. (USA)

3D display considerations for rugged airborne environments, Tracy J. Barnidge, Joseph L. Tchon, Rockwell Collins, Inc. (USA). . . . . [9470-8]

A guide for human factors research with stereoscopic 3D displays, John P. McIntire, Paul R. Havig II, Alan R. Pinkus, Air Force Research Lab. (USA) . . . . [9470-9]

SESSION 4 . . . . THU 10:40 AM TO 11:20 AM

Immersive Environments and Augmented Reality

Session Chair: **Jean-Michel Francois,** Thales Avionics S.A. (France)

Exploring immersive environments to aid urban intelligence, surveillance and reconnaissance operations, Jason Roll, Air Force Research Lab. (USA); Peter Venero, Infoscitex Corp. (USA); Donald Adkins, Air Force Research Lab. (USA); Sarah Lampke, Timothy MtCastle, Infoscitex Corp. (USA) . . . . . [9470-10]

Augmented reality enabling intelligence exploitation at the edge, Sue E. Kase, Elizabeth K. Bowman, Debra Patton, U.S. Army Research Lab. (USA) . . . . [9470-11]

SESSION 5 . . . . .THU 11:20 AM TO 12:00 PM

Increased Resolution Via Virtual Pixel

Session Chair: **Joseph L. Tchon,** Rockwell Collins, Inc. (USA)

A virtual pixel software and hardware technology to increase projector resolution, Jeremy Straub, Benjamin M. Kading, Univ. of North Dakota (USA) . . . . [9470-12]

A virtual pixel technology to enhance the resolution of monitors and for other purposes, Benjamin M. Kading, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9470-13]

Lunch/Exhibition Break . . . . .12:00 pm to 1:30 pm

SESSION 6 . . . . THU 1:30 PM TO 3:00 PM

Display Performance Research and Advances

Session Chair: **Gary W. Jones,** NanoQuantum Sciences, Inc. (USA)

Review of the evolution of display technologies for next generation aircraft *(Invited Paper)*, Joseph L. Tchon, Rockwell Collins, Inc. (USA) . . . . [9470-14]

A neuroergonomic quasi-experiment: predictors of situation awareness and display usability with USAF pilots while performing complex tasks, Steven D. Harbour, U.S. Air Force (USA); James C. Christensen, Air Force Research Lab. (USA) . . . . [9470-15]

A practical definition of eye-limited display system resolution, Charles J. Lloyd, Visual Performance, LLC (USA) . . . . [9470-16]

Just noticeable color difference: implications for display systems, Daniel D. Desjardins, Northrup Grumman (USA) . . . . [9470-17]

SESSION 7 . . . . THU 3:30 PM TO 4:20 PM

Flexible Displays

Session Chair: **Paul L. Wisely,**
HOLOEYE Systems Inc. (United Kingdom)

Recent advances in OLED and flexible displays and their potential for application to aerospace and military display systems *(Invited Paper)*, Kalluri R. Sarma, Honeywell Technology (USA) . . . . [9470-18]

Flexible displays for military applications, Jason T. Holmstedt, Physical Optics Corp. (USA) . . . . [9470-19]

SESSION 8 . . . . THU 4:20 PM TO 7:00 PM

Cornucopia

Session Chair: **Daniel D. Desjardins**

Analog video to ARINC 818, Paul Grunwald, Great River Technology, Inc. (USA) . . . . [9470-20]

Electro-textile garments for power and data distribution, Jeremiah Slade, Infoscitex Corp. (USA); Carole Winterhalter, U.S. Army Natick Soldier Research, Development and Engineering Ctr. (USA) . . . . [9470-21]

Formation of operation script by means of strategic foresight and international relations theories, Sefa Alioglu, Turkish Air War College (Turkey); Caner Nayki, Turkish Air War College (Turkey) . . . . [9470-22]

Interoperabilty, speaking the same language via tactical data link systems, Erdem Hekimhan, Savas Ozkaynak, Turkish Air War College (Turkey). . [9470-23]

Can unmanned aerial vehicles radically change the border security?, Abdullah Erkan, Turkish Air Force (Turkey) . . . . [9470-24]

Augmented reality: the applications of augmented reality in military area and military schools, Isa Haskologlu, Mehmet Sisman, Enes Erol, Turkish Military Academy (Turkey) . . . . [9470-37]

Performance and lifetime enhancements to legacy analog head-up displays systems, in military applications, through affordable digital upgrades, William P. Bleha, Paul Wisely, HOLOEYE Systems, Inc. (USA) . . . . [9470-38]

LCOS-based digital rifle scope display, William P. Bleha, Paul Wisely, HOLOEYE Systems, Inc. (USA). . . . . [9470-39]

CONFERENCE 9470B

Wednesday 22–22 April 2015 • Part of Proceedings of SPIE Vol. 9470

Head- and Helmet-Mounted Displays XX: Design and Applications

Conference Chairs: **Peter L. Marasco,** Air Force Research Lab. (USA); **Paul R. Havig,** Air Force Research Lab. (USA); **Michael P. Browne,** SA Photonics (USA); **James E. Melzer,** Rockwell Collins Optronics (USA)

Program Committee: **Randall E. Bailey,** NASA Langley Research Ctr. (USA); **Sion Jennings,** National Research Council Canada (Canada)

Tuesday 21 April

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Development of a helmet/helmet-display-unit alignment tool (HAT) for the Apache helmet and display unit, Thomas H. Harding, William E. McLean, Jonathan K. Statz, Clarence E. Rash, U.S. Army Aeromedical Research Lab. (USA) . . . . [9470-36]

Wednesday 22 April

SESSION 9 . . . . WED 8:30 AM TO 10:30 AM

Head and Helmet Mounted Displays: A Retrospective

Session Chair: **Michael P. Browne,** SA Photonics (USA)

A history of helmet mounted displays *(Invited Paper)*, Bobby D. Foote, Rockwell Collins, Inc. (USA); James E. Melzer, Rockwell Collins Optronics (USA) . . . . [9470-25]

The impact of human factors, crashworthiness and optical performance design requirements on helmet-mounted display development from the 1970s to the present *(Invited Paper)*, Thomas H. Harding, Clarence E. Rash, William E. McLean, John S. Martin, U.S. Army Aeromedical Research Lab. (USA) . . . . [9470-26]

In the blink of an eye; head mounted displays development within BAE Systems *(Invited Paper)*, Alexander A. Cameron, BAE Systems (United Kingdom) . . . . [9470-27]

A review of head-worn display research at NASA Langley Research Center *(Invited Paper)*, Jarvis J. Arthur III, Randall E. Bailey, Steven P. Williams, Lawrence J. Prinzel III, Kevin J. Shelton, Vincent E. Houston, NASA Langley Research Ctr. (USA) . . . . [9470-28]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:30 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 10 . . . . WED 1:00 PM TO 2:20 PM

Testing and Human Factors of HMDs

Session Chair: **James E. Melzer,** Rockwell Collins Optronics (USA)

Flight test of a head-worn display as an equivalent-HUD for terminal operations, Kevin J. Shelton, Jarvis J. Arthur III, Stephanie N. Nicholas, Randall E. Bailey, Steven P. Williams, Lawrence J. Prinzel III, NASA Langley Research Ctr. (USA). . . . . [9470-29]

Dynamic registration of an optical see-through HMD into a wide field-of-view rotorcraft flight simulation environment, Franz Viertler, Manfred Hajek, Technische Univ. München (Germany) . . . . [9470-30]

Visibility of monocular symbology in transparent head-mounted display applications, Marc Winterbottom, USAF School of Aerospace Medicine (USA); Robert Patterson, 711 HPW/RHX (USA); Byron Pierce, Certified Human Factors Professional (USA); James Gaska, Steven Hadley, USAFSAM (USA) . . [9470-31]

Visual fatigue induced by optical misalignment in binocular devices: application to night vision binocular devices, Maria Gavrilescu, Defence Science and Technology Organisation (Australia); Josephine Battista, Michael R. Ibbotson, National Vision Research Institute (Australia); Peter Gibbs, Defence Science and Technology Organisation (Australia). . . . . [9470-32]

SESSION 11. . . . . WED 2:20 PM TO 3:00 PM

Enabling Technologies

Enhancing head and helmet-mounted displays using a virtual pixel technology, Benjamin M. Kading, Jeremy Straub, Univ. of North Dakota (USA) . . . . [9470-33]

Polymer prisms for head hounted optical systems, Dave Schmidt, Howard Wong, Robert Benson, Rochester Precision Optics, LLC (USA) . . . . [9470-34]

SESSION 12 . . . . WED 3:30 PM TO 4:50 PM

Head and Helmet Mounted Displays and Display Technologies and Applications for Defense, Security, and Avionics

Joint Session with Conferences 9470A and 9470B

Session Chair: **Peter L. Marasco,** Air Force Research Lab. (USA)

Diver's full face mask head-up display using waveguide optical display technology, Dennis Gallagher, Richard Manley, Naval Surface Warfare Ctr. Panama City Div. (USA). . . . . [9470-1]

The impact of coloured symbology on cockpit eyes-out display effectiveness: a survey of key parameters, Maha Fares, Derek R. Jordan, BAE Systems (United Kingdom) . . . . [9470-35]

Augmented reality technology for heads-up, day/night situational awareness for the dismounted soldier, Eric Gans, Applied Research Associates, Inc. (USA) . . . . [9470-2]

Operational feedback on night vision with hyperstereoscopic HMD, Jean-Michel Francois, Thales Avionics S.A. (France); Daniel Maulet, Thales Angénieux S.A. (France); Joel Baudou, Thales Avionics S.A. (France) . . . . [9470-3]

CONFERENCE 9471

Tuesday 21–21 April 2015 • Proceedings of SPIE Vol. 9471

Degraded Visual Environments: Enhanced, Synthetic, and External Vision Solutions 2015

Conference Chairs: **Jeff J. Güell,** The Boeing Co. (USA); **Jack Sanders-Reed,** The Boeing Co. (USA)

Program Committee: **Jarvis J. Arthur III,** NASA Langley Research Ctr. (USA); **Cory Dixon,** Stratom, Inc. (USA); **Thomas R. Muensterer,** Cassidian (Germany); **Niklas Peinecke,** Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany); **Christian Pschierer,** Jeppesen GmbH (Germany); **Carlo L. Tiana,** Rockwell Collins, Inc. (USA)

Tuesday 21 April

SESSION 1. . . . . .TUE 8:00 AM TO 10:00 AM

DVE Sensors I

Session Chairs: **Niklas Peinecke,** Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany); **Cory Dixon,** Stratom, Inc. (USA)

Subjective evaluation of a prototype night vision goggle, Gregory J. Hardy, The Boeing Co. (USA); Bobby D. Foote, Rockwell Collins, Inc. (USA) . . . [9471-1]

Fixed wing rests using polarized maintained OPAL lidar and non-polarized OPAL lidar, Philip M. Church, Evan Trickey, Xiaoying Cao, Neptec Technologies Corp. (Canada) . . . . [9471-2]

Passive, real-time millimeter wave imaging for degraded visual environment mitigation, Thomas E. Dillon, Christopher A. Schuetz, Richard D. Martin, Daniel G. Mackrides, Charles Harrity, Phase Sensitive Innovations, Inc. (USA); Dennis W. Prather, Univ. of Delaware (USA) . . . . [9471-3]

Testing of an improved passive millimeter wave imager for degraded visual environments applications, Colin D. Cameron, Rupert N. Anderton, QinetiQ Ltd. (United Kingdom); John N. Sanders-Reed, The Boeing Co. (USA); Dennis J. Yelton, Boeing-SVS, Inc. (USA); Gordon N. Sinclair, James G. Burnett, Philip J. Kent, QinetiQ Ltd. (United Kingdom); Jeff J. Güell, The Boeing Co. (USA) . . . . [9471-4]

LandSafe precision flight instrumentation system for rotorcraft operations in degraded environments, Pri Mamidipudi, Elizabeth Dakin, Optical Air Data Systems, LLC (USA) . . . . [9471-5]

A multi-beam radar altimeter: lessons learned with a MIMO solution, Ian D. Longstaff, The Univ. of Queensland (Australia) . . . . [9471-6]

SESSION 2 . . . . .TUE 10:30 AM TO 11:50 AM

DVE Sensors II

Session Chairs: **Christian Pschierer,** Jeppesen GmbH (Germany); **Carlo L. Tiana,** Rockwell Collins, Inc. (USA)

Three-dimensional landing zone joint capability technology demonstration results, James C. Savage, Air Force Research Lab. (USA) . . . . [9471-7]

An investigation in processing techniques for sidelobe suppression in millimeter wave DVE radars for imagery, Janeen Winne, U.S. Army Communications-Electronics Research Development and Engineering Command (USA); Antoinette Beasley, Lee Moyer, EOIR Technologies (USA) . . . . [9471-8]

Flight test results of ladar brownout look-through capability, Stephen Stelmash, Fairchild Controls Corp. (USA); Thomas R. Muensterer, Patrick Kramper, Christian Samuelis, Daniel Buehler, Matthias Wegner, Airbus Defence and Space (Germany); Sagar Sheth, Ferchau Engineering (Germany) . . . . [9471-9]

DVE flight test results of a sensor enhanced 3D conformal pilot support system, Thomas R. Muensterer, Philipp Voelschow, Bernhard Singer, Michael Strobel, Patrick Kramper, Airbus Defence and Space (Germany) . . . . . [9471-10]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . .TUE 1:20 PM TO 3:00 PM

Fusion, SVS, and Processing

Session Chairs: **Carlo L. Tiana,** Rockwell Collins, Inc. (USA); **Jarvis J. Arthur III,** NASA Langley Research Ctr. (USA)

Fusion of synthetic and live imagery in a two view domain, Larry Schaffer, GE Intelligent Platforms (USA). . . . . [9471-11]

Data fusion for a DVE solution, Noah Baird, Michael Crisafulli, ENSCO Avionics, Inc. (USA) . . . . [9471-12]

Is OpenSceneGraph an option for ESVS displays?, Niklas Peinecke, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany) . . . . [9471-13]

Combining IR imagery and 3D lidar-based symbology for a helicopter DVE support, Thomas R. Muensterer, Martin J. Kress, Airbus Defence and Space (Germany); Mark C. Lupton, Graham Passey, SELEX ES (United Kingdom) . . . . [9471-14]

Seamless situational awareness, Howard W. Wiebold, Honeywell (USA) . . . . [9471-15]

SESSION 4 . . . . TUE 3:30 PM TO 4:50 PM

Man-Machine Interface

Session Chairs: **Jarvis J. Arthur III,** NASA Langley Research Ctr. (USA); **Thomas R. Muensterer,** Cassidian (Germany)

Introduction of a 3D perspective view in the Navigation Display: featuring pilot's mental model, Lars Ebrecht, Sven Schmerwitz, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany) . . . . [9471-16]

Drift indication for helicopter approach and landing, Sven Schmerwitz, Patrizia M. Knabl, Thomas Lueken, Hans-Ullrich Doehler, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany) . . . . [9471-17]

Virtual aircraft-fixed cockpit instruments, Hans-Ullrich Doehler, Johannes M. Ernst, Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany) . . . . [9471-18]

HMI aspects of the usage of ladar 3D data in pilot DVE support systems, Thomas R. Muensterer, Philipp Voelschow, Bernhard Singer, Michael Strobel, Patrick Kramper, Airbus Defence and Space (Germany) . . . . [9471-19]

SESSION 5 . . . . TUE 4:50 PM TO 5:50 PM

Compensation Techniques

Session Chairs: **Thomas R. Muensterer,** Cassidian (Germany); **Niklas Peinecke,** Deutsches Zentrum für Luft- und Raumfahrt e.V. (Germany)

Sensor modeling for precision ship-relative navigation in degraded visual environment conditions, Marcel Bergerman, Sanjiv Singh, Gary W. Sherwin, Regis M. Hoffman, Samuel Nalbone, Near Earth Autonomy, Inc. (USA); Lyle Chamberlain, Near Earth Autonomy, Inc. (USA) . . . . [9471-20]

Real-time correction of surveillance video for atmospheric distortion using FPGA-based processing, Steve C. J. Parker, RFEL Ltd. (United Kingdom) . . . . [9471-21]

Mathematical principles of settings for extremely high resolution in multi beams systems, Evgeni N. Terentiev, Lomonosov Moscow State Univ. (Russian Federation) . . . . [9471-22]

CONFERENCE 9472

Tuesday–Thursday 21–23 April 2015 • Proceedings of SPIE Vol. 9472

Algorithms and Technologies for Multispectral, Hyperspectral, and Ultraspectral Imagery XXI

Conference Chairs: **Miguel Velez-Reyes,** The Univ. of Texas at El Paso (USA); **Fred A. Kruse,** Naval Postgraduate School (USA)

Program Committee: **Eustace L. Dereniak,** College of Optical Sciences, The Univ. of Arizona (USA); **Michael T. Eismann,** Air Force Research Lab. (USA); **Glenn E. Healey,** Univ. of California, Irvine (USA); **Jacqueline J. Le Moigne,** NASA Goddard Space Flight Ctr. (USA); **David W. Messinger,** Rochester Institute of Technology (USA); **Dalton S. Rosario,** U.S. Army Research Lab. (USA); **Alan P. Schaum,** U.S. Naval Research Lab. (USA); **James Theiler,** Los Alamos National Lab. (USA); **Grady Tuell,** Georgia Tech Research Institute (USA)

Tuesday 21 April

SESSION 1. . . . . TUE 8:30 AM TO 10:30 AM

Spectral Detection, Identification, and Quantification

Session Chair: **Miguel Velez-Reyes,** The Univ. of Texas at El Paso (USA); **Fred A. Kruse,** Naval Postgraduate School (USA)

Chemical agent resistant coating (CARC) detection using hyperspectral imager (HSI), Hai-Wen Chen, Michael McGurr, Mark Brickhouse, Booz Allen Hamilton Inc. (USA) . . . . [9472-1]

Metrics for the comparative evaluation of chemical plume identification algorithms, Eric Truslow, Northeastern Univ. (USA); Steven E. Golowich, Dimitris G. Manolakis, MIT Lincoln Lab. (USA); Vinay K. Ingle, Northeastern Univ. (USA) . . . . [9472-2]

Pattern recognition in hyperspectral persistent imaging, Dalton S. Rosario, U.S. Army Research Lab. (USA); Joao M. Romano, U.S. Army Armament Research, Development and Engineering Ctr. (USA); Christoph C. Borel-Donohue, Air Force Institute of Technology (USA) . . . . [9472-3]

Imaging white blood cells using a snapshot hyperspectral imaging system, Christopher J. Robison, Christopher J. Kolanko, Thirimachos Bourlai, Jeremy M. Dawson, West Virginia Univ. (USA) . . . . [9472-4]

Burn injury diagnostic imaging device's accuracy improved by outlier detection and removal, Weizhi Li, Weirong Mo, Xu Zhang, Yang Lu, Eric W. Sellke, Wensheng Fan, J. Michael DiMaio, Jeffery E. Thatcher, Spectral MD, Inc. (USA) . . . . [9472-5]

Skin segmentation by active learning for human detection in hyperspectral images, Ion Marques, Manuel Graña, Univ. del País Vasco (Spain); Stephanie M. Sanchez, Mohammed Q. Alkhatib, Miguel Velez-Reyes, The Univ. of Texas at El Paso (USA) . . . . [9472-6]

SESSION 2 . . . . TUE 11:00 AM TO 12:00 PM

Spectral Data Compression and Dimensionality Reduction

Session Chair: **Dalton S. Rosario,** U.S. Army Research Lab. (USA)

Multi-pass encoding of hyperspectral imagery with spectral quality control, Steven R. Wasson, William Walker, Applied Technology Associates (USA) . . . . [9472-7]

SLIC superpixels for efficient graph-based dimensionality reduction of hyperspectral imagery, Xuewen Zhang, Selene E. Chew, Zhenlin Xu, Nathan D. Cahill, Rochester Institute of Technology (USA) . . . . [9472-8]

A concept for hyperspectral imaging with compressive sampling and dictionary recovery, Robert R. Muise, David Twede, Lockheed Martin Missiles and Fire Control (USA). . . . . [9472-9]

Lunch/Exhibition Break . . . . Tue 12:00 pm to 1:30 pm

SESSION 3 . . . . TUE 1:30 PM TO 3:30 PM

Spectral Signature Modeling, Measurements, and Applications I

Session Chair: **Michael T. Eismann,** Air Force Research Lab. (USA)

Calculation of electronic-excited-state absorption spectra of water clusters using time-dependent density functional theory, Lulu Huang, Samuel G. Lambrakos, U.S. Naval Research Lab. (USA); Andrew Shabaev, George Mason Univ. (USA); Lou Massa, Hunter College (USA) . . . . [9472-10]

Comparison of microfacet BRDF model elements to diffraction BRDF model elements, Samuel D. Butler, Stephen E. Nauyoks, Michael A. Marciniak, Air Force Institute of Technology (USA) . . . . [9472-11]

Development of land surface reflectance models based on multiscale simulation, Adam A. Goodenough, Scott D. Brown, Rochester Institute of Technology (USA) . . . . [9472-12]

Advances in simulating radiance signatures for dynamic air/water interfaces, Adam A. Goodenough, Scott D. Brown, Aaron D. Gerace, Rochester Institute of Technology (USA) . . . . [9472-13]

Influence of density on hyperspectral BRDF signatures, Douglas S. Peck, Malachi J. Schultz, Charles M. Bachmann, Brittany Ambeau, Justin Harms, Rochester Institute of Technology (USA) . . . . [9472-14]

Development and comparison of data reconstruction methods for chromotomographic hyperspectral imagers, Michael R. Hawks, Air Force Institute of Technology (USA) and Oak Ridge Institute for Science & Education (USA); Alan L. Jennings, Air Force Institute of Technology (USA); Ryan Tervo, U.S. Air Force (USA) . . . . [9472-15]

SESSION 4 . . . . TUE 4:00 PM TO 5:40 PM

SHARE 2012 Analysis Results

Session Chair: **John Kerekes,** Rochester Institute of Technology (USA)

Target detection assessment of the SHARE 2010/2012 hyperspectral data collection campaign, Emmett J. Ientilucci, Rochester Institute of Technology (USA) . . . . [9472-16]

Comprehensive analysis results from the SHARE 2012 subpixel detection and unmixing experiments, Yihang Sun, John Kerekes, Rochester Institute of Technology (USA) . . . . [9472-17]

On the effects of spatial and spectral resolution on spatial-spectral target detection in SHARE 2012 and Bobcat 2013 hyperspectral imagery, Jason R. Kaufman, Exelis Space Computer Corp. (USA); Michael T. Eismann, Air Force Research Lab. (USA); Bradley M. Ratliff, Exelis Space Computer Corp. (USA); Mehmet Celenk, Ohio Univ. (USA) . . . . [9472-18]

Locating the shadow regions in LIDAR data: results on the SHARE 2012 Dataset, Seniha E. Yuksel, Hacettepe Univ. (Turkey); Mustafa Boyaci, ASELSAN Inc. (Turkey). . . . . [9472-19]

Effect of endmember clustering on proportion estimation: results on the Share 2012 Dataset, Seniha E. Yuksel, Hacettepe Univ. (Turkey); Erdinc Gunes, ASELSAN Inc. (Turkey) . . . . [9472-20]

Wednesday 22 April

SESSION 5 . . . . WED 8:30 AM TO 10:30 AM

Hyperspectral Target Detection

Session Chair: **David W. Messinger,**
Rochester Institute of Technology (USA)

Incorporating signal-dependent noise for hyperspectral target detection, Christopher J. Morman, Russell C. Hardie, Univ. of Dayton (USA); Joseph Meola, Air Force Research Lab. (USA) . . . . [9472-21]

Robust chemical and chemical-resistant material detection using hyperspectral imager, Hai-Wen Chen, Michael McGurr, Mark Brickhouse, Booz Allen Hamilton Inc. (USA). . . . . [9472-22]

An adaptive locally linear embedding manifold learning approach for hyperspectral target detection, Amanda K. Ziemann, David W. Messinger, Rochester Institute of Technology (USA) . . . . [9472-23]

Peripheral ellipsoids for anomaly detection in remote sensing imagery, Guenchik J. Grosklos, James P. Theiler, Los Alamos National Lab. (USA) . . . . [9472-24]

Video rate multispectral imaging for camouflaged target detection and tracking, Samuel T. Henry, James C. Jafolla, Surface Optics Corp. (USA) . . . . [9472-25]

Evaluating backgrounds for subpixel target detection: when closer isn't better, Nofar Hasson, Shmual Asulin, Dan G. Blumberg, Stanley R. Rotman, Ben-Gurion Univ. of the Negev (Israel) . . . . [9472-26]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:30 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours..

SESSION 6 . . . . .WED 1:10 PM TO 3:10 PM

Novel Mathematically-Inspired Methods of Processing Hyperspectral Airborne and Satellite Imagery: Novel Mathematics Algorithms I

Session Chair: **Jacqueline J. Le Moigne,**
NASA Goddard Space Flight Ctr. (USA)

Spatial-spectral dimensionality reduction of hyperspectral imagery with partial knowledge of class labels, Nathan D. Cahill, Selene E. Chew, Paul S. Wenger, Rochester Institute of Technology (USA) . . . . [9472-27]

Applications of direction-sensitive sparse representations to hyperspectral image analysis, Julia Dobrosotskaya, Case Western Reserve Univ. (USA) . . . . [9472-28]

Transitioning from semi-supervised to unsupervised feature extraction using Schrödinger Eigenmaps, Timothy Doster, U.S. Naval Research Lab. (USA) . . . . [9472-29]

Detecting plumes in LWIR using nonnegative matrix factorization and graph-based method, Jing Qin, Andrea L. Bertozzi, Univ. of California, Los Angeles (USA); Thomas Laurent, Loyola Marymount Univ. (USA); Justin Sunu, Claremont Graduate Univ. (USA); Kevin Bui, Shuyi Wang, Univ. of California, Los Angeles (USA); Ricardo V. R. Tan, Jasmine Dahilig, Loyola Marymount Univ. (USA); Jared L. Rohe, Univ. of San Francisco (USA) . . . . [9472-30]

Modeling and mitigating noise in graph and manifold representations of hyperspectral imagery, Charles M. Bachmann, Can Jin, Rochester Institute of Technology (USA) . . . . [9472-31]

Algorithms for retrieving temperature and emissivity from hyperspectral data in complex environments, Christoph C. Borel-Donohue, Air Force Institute of Technology (USA); Dalton S. Rosario, U.S. Army Research Lab. (USA); Joao M. Romano, U.S. Army Armament Research, Development and Engineering Ctr. (USA). . . . . [9472-32]

SESSION 7 . . . . WED 3:40 PM TO 5:40 PM

Novel Mathematically-Inspired Methods of Processing Hyperspectral Airborne and Satellite Imagery: Novel Mathematics Algorithms II

Session Chair: **Wojciech Czaja,** Univ. of Maryland, College Park (USA)

Classification of multi-modality sensor data with limited labeled data, Melba M. Crawford, Purdue Univ. (USA); Saurabh Prasad, Univ. of Houston (USA); Hsiuhan Yang, Purdue Univ. (USA); Xiong Zhou, Univ. of Houston (USA); Zhou Zhang, Purdue Univ. (USA) . . . . [9472-33]

LWIR HSI target detection in the urban canyon, Amit Banerjee, Joshua B. Broadwater, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . [9472-34]

Self-organization, neighborhoods, and possibilistic classification, Paul D. Gader, Leila Kalantari, Ron Fick, Univ. of Florida (USA). . . . . . . [9472-35]

Schrodinger Eigenmaps for spectral target detection, Leidy P. Dorado-Munoz, David W. Messinger, Rochester Institute of Technology (USA) . [9472-36]

Functions of multiple instances for sub-pixel target characterization in hyperspectral imagery, Alina Zare, Changzhe Jiao, Univ. of Missouri-Columbia (USA) . . . . [9472-37]

Anisotropic representations for superresolution of hyperspectral data, James M. Murphy, Wojciech Czaja, Daniel Weinberg, Edward Bosch, Univ. of Maryland, College Park (USA). . . . . [9472-38]

Thursday 23 April

SESSION 8 . . . . .THU 8:30 AM TO 10:30 AM

Spectral Signature Modeling, Measurements, and Applications II

Session Chair: **Emmett J. Ientilucci,**
Rochester Institute of Technology (USA)

The development of a DIRSIG simulation environment to support instrument trade studies for the SOLARIS sensor, Aaron D. Gerace, Jie Yang, Rochester Institute of Technology (USA); Joel McCorkel, NASA Goddard Space Flight Ctr. (USA) . . . . [9472-39]

Empirical measurement and model validation of infrared spectra of contaminated surfaces, Sean Archer, Michael G. Gartley, John Kerekes, Rochester Institute of Technology (USA); Bogdon R. Cosofret, Jay P. Giblin, Physical Sciences Inc. (USA). . . . . [9472-40]

Spectral analysis of water samples using modulated resonance features for monitoring of public water resources, Samuel G. Lambrakos, U.S. Naval Research Lab. (USA); Constantine Yapijakis, The Cooper Union for the Advancement of Science and Art (USA); Daniel Aiken, U.S. Naval Research Lab. (USA); Andrew Shabaev, George Mason Univ. (USA); Scott A. Ramsey, Joseph E. Peak, U.S. Naval Research Lab. (USA). . . . . [9472-41]

An accelerated line-by-line option for MODTRAN combining on-the-fly generation of line center absorption within 0.1 cm-1 bins and pre-computed line tails, Alexander Berk, Patrick F. Conforti, Lawrence S. Bernstein, Prabhat K. Acharya, Chona S. Guiang, Raphael Panfili, Spectral Sciences, Inc. (USA) . . . . [9472-42]

A comparison of all atmospheric transmission software, Dylan Payne, John Schroeder, Ontar Corporation (USA). . . . . [9472-43]

Atmospheric correction of shortwave hyperspectral imagery using a fast, full-scattering 1D-VAR retrieval scheme, Jean-Claude Thelen, Stephan Havemann, Jonathan P. Taylor, Gerald J. Wong, Met Office (United Kingdom) . . . . [9472-44]

CONFERENCE 9472

SESSION 9 . . . . THU 11:00 AM TO 12:00 PM

Spectral Sensor Design, Development, and Characterization

Session Chair: **Grady Tuell,** Georgia Tech Research Institute (USA)

Imaging polarization heterodyned interferometry using savart plates, Bryan D. Maione, Michael W. Kudenov, North Carolina State Univ. (USA). . . . [9472-45]

Passive standoff superresolution imaging using spatial-spectral multiplexing, Ethan Woodard, Michael W. Kudenov, North Carolina State Univ. (USA) . . . . [9472-46]

Automated turbulence and jitters correction with a dual port imaging Fourier-transform spectrometer, Florent M. Prel, Louis M. Moreau, Stéphane M. Lantagne, Claude B. Roy, ABB Analytical Measurement (Canada) . . [9472-47]

Lunch/Exhibition Break . . . . Thu 12:00 pm to 1:30 pm

SESSION 10 . . . . .THU 1:30 PM TO 2:50 PM

Data Fusion and Multiple Modality Spectral Applications

Session Chairs: **James P. Theiler,** Los Alamos National Lab. (USA); **Miguel Velez-Reyes,** The Univ. of Texas at El Paso (USA)

Integrated visible to near-infrared, shortwave infrared, and longwave infrared spectral analysis for surface composition mapping near Mountain Pass, California, Meryl L. McDowell, Scitor Corp. (USA) and Naval Postgraduate School (USA); Fred A. Kruse, Naval Postgraduate School (USA) . . . . [9472-54]

Exploration of integrated visible to near-, shortwave-, and longwave-infrared (full range) hyperspectral data analysis, Shelli R. Cone, Scitor Corp. (USA) and Naval Postgraduate School (USA); Fred A. Kruse, Naval Postgraduate School (USA); Meryl L. McDowell, Naval Postgraduate School (USA) and Scitor Corp. (USA) . . . . [9472-55]

Analysis of multispectral and hyperspectral longwave infrared (LWIR) data for geologic mapping, Fred A. Kruse, Naval Postgraduate School (USA); Meryl L. McDowell, Naval Postgraduate School (USA) and Scitor Corp. (USA)[9472-56]

Comparative analysis of airborne visible/infrared imaging spectrometer (AVIRIS) and hyperspectral thermal emission spectrometer (HyTES) longwave infrared (LWIR) hyperspectral data for geologic mapping, Fred A. Kruse, Naval Postgraduate School (USA) . . . . [9472-57]

SESSION 11 . . . . THU 3:20 PM TO 5:20 PM

Multispectral Applications

Session Chair: **Fred A. Kruse,** Naval Postgraduate School (USA)

Symmetrized regression for multispectral background estimation, James P. Theiler, Brendt E. Wohlberg, Los Alamos National Lab. (USA) . . . . [9472-48]

A comparison of directed search and in scene search target detection in Worldview-2 datasets, Stanley I. Grossman, National Geospatial-Intelligence Agency (USA) . . . . [9472-49]

Evaluation techniques and metrics for assessment of Pan+MSI fusion (Pansharpening), Ryan A. Mercovich, Vencore, Inc. (USA) . . . . [9472-50]

Snapshot imaging Fraunhofer line discriminator for detection of plant fluorescence, Subharup Gupta Roy, Michael W. Kudenov, North Carolina State Univ. (USA) . . . . [9472-51]

Assessing the impact of sub-pixel vegetation structure on imaging spectroscopy via simulation, Wei Yao, Jan A. N. van Aardt, Paul Romanczyk, David Kelbe, Martin van Leeuwen, Rochester Institute of Technology (USA) . . . . [9472-52]

Hyperspectral image-based methods for spectral biodiversity, Juan Carlos Santos Ferrer, David M. González Chévere, Univ. de Puerto Rico Mayagüez (USA); Ollantay Medina, Univ. of Puerto Rico (USA); Jesus Danilo Chinea, Vidya B. Manian, Univ. de Puerto Rico Mayagüez (USA) . . . . [9472-53]

INTERACTIVE POSTER SESSION
THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Cooperative spectral and spatial feature fusion for camouflaged target detection, Sungho Kim, Yeungnam Univ. (Korea, Republic of) . . . . [9472-58]

On the response function separability of push-broom hyperspectral imaging systems, Jurij Jemec, Univ. of Ljubljana (Slovenia); Franjo Pernuš, Boštjan Likar, Univ. of Ljubljana (Slovenia), Sensum d.o.o. (Slovenia); Miran Bürmen, Univ. of Ljubljana (Slovenia) . . . . [9472-59]

Evaluation of rainfall and NDVI anomalies using distributed lag models, Worku Zewdie Gebrehiwot, Elmar Csaplovics, Technische Univ. Dresden (Germany) . . . . [9472-60]

Skin detection in hyperspectral imagery, Stephanie M. Sanchez, Miguel Velez-Reyes, The Univ. of Texas at El Paso (USA) . . . . [9472-61]

Can we match ultraviolet face images against their visible counterparts?, Neeru Narang, Thirimachos Bourlai, West Virginia Univ. (USA) . . . . [9472-62]

CONFERENCE 9473

Monday–Tuesday 20–21 April 2015 • Proceedings of SPIE Vol. 9473

Geospatial Informatics, Fusion, and Motion Video Analytics V

Conference Chairs: **Matthew F. Pellechia,** Exelis, Inc. (USA); **Kannappan Palaniappan,** Univ. of Missouri-Columbia (USA); **Peter J. Doucette,** Integrity Applications, Inc. (USA); **Shiloh L. Dockstader,** Exelis, Inc. (USA); **Gunasekaran Seetharaman,** Air Force Research Lab. (USA)

Program Committee: **John A. Berger,** Toyon Research Corp. (USA); **Erik P. Blasch,** Air Force Research Lab. (Canada); **Bernard V. Brower,** Exelis, Inc. (USA); **Subhasis Chaudhuri,** Indian Institute of Technology Bombay (India); **Brian J. Daniel,** Exelis Inc. (USA); **Larry S. Davis,** Univ. of Maryland, College Park (USA); **Mark A. Duchaineau,** Google (USA); **Adel Hafiane,** Ecole Nationale Supérieure d'Ingénieurs (France); **Simon J. Julier,** Univ. College London (United Kingdom); **Haibin Ling,** Temple Univ. (USA); **Peter Paul,** Xerox Corp. (USA); **Robert B. Pless,** Washington Univ. in St. Louis (USA); **V. B. Surya Prasath,** Univ. of Missouri-Columbia (USA); **Kari A. Pulli,** NVIDIA Corp. (USA); **Ambasamudram Rajagopalan,** Indian Institute of Technology Madras (India); **Raghuveer M. Rao,** U.S. Army Research Lab. (USA); **John A. Richards,** Sandia National Labs. (USA); **Sartaj Sahni,** Univ. of Florida (USA); **Carl Salvaggio,** Rochester Institute of Technology (USA); **Stefano Soatto,** Univ. of California, Los Angeles (USA); **Suresh Subramanian,** Lockheed Martin Missiles and Fire Control (USA); **Bruce Swett,** EOIR Technologies (USA); **George R. Thoma,** National Library of Medicine (USA); **Darrell L. Young,** Raytheon Intelligence & Information Systems (USA); **Karmon M. Vongsy,** Air Force Research Lab. (USA); **V. B. Surya Prasath,** Univ. of Missouri-Columbia (USA)

Monday 20 April

INTRODUCTORY REMARKS. . . . . 1:40 PM TO 1:50 PM

Session Chair: **Matthew F. Pellechia,** Exelis Geospatial Systems (USA)

SESSION 1. . . . . .MON 1:50 PM TO 4:40 PM

Motion Video Analytics

Session Chair: **Gunasekaran Seetharaman,** Air Force Research Lab. (USA)

Streaming analysis of track data from video, Jiangqin Sun, David W. Messinger, Rochester Institute of Technology (USA) . . . . [9473-1]

Illumination robust change detection with CMOS imaging sensors, Vijay Rengarajan, Sheetal B. Gupta, Ambasamudram N. Rajagopalan, Indian Institute of Technology Madras (India); Gunasekaran Seetharaman, Air Force Research Lab. (USA) . . . . [9473-2]

Cueing motion blur for registration of inclined planar scenes, Arun A. Nair, Indian Institute of Technology Madras (India); Purnachandra Rao Makkena, IIT Madras (India); Ambasamudram N. Rajagopalan, Indian Institute of Technology Madras (India); Gunasekaran Seetharaman, Air Force Research Lab. (USA) . . . . [9473-3]

Object and activity detection from aerial video, Stephen Se, Feng Shi, Xin Liu, Mohsen Ghazel, MacDonald, Dettwiler and Associates Ltd. (Canada) . . . . [9473-4]

Application of VNIIRS for target tracking, Erik Blasch, Air Force Research Lab. (USA) . . . . [9473-5]

AESOP: adaptive event detection software using programming by example, Ashwin Thangali, Neal Checka, Harsha Prasad, Sai Kethamakka, Vecna Technologies, Inc. (USA) . . . . [9473-6]

Textured object video segmentation using temporal coherency, V. B. Surya Prasath, Rengarajan Pelapur, Raphael Viguier, Kannappan Palaniappan, Univ. of Missouri-Columbia (USA); Gunasekaran Seetharaman, Air Force Research Lab. (USA) . . . . [9473-7]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 2 . . . . .TUE 8:00 AM TO 10:00 AM

Geo-registration and Uncertainty Handling in Geospatial Data

Session Chair: **Shiloh L. Dockstader,** Exelis Geospatial Systems (USA)

Pedestrian dead reckoning using a novel sensor module that interfaces with modern smart devices, Gregory F. S. Hewitt, Phil J. Stimac, Mark J. McKenna, Matt Fordham, Richard Demar, Applied Research Associates, Inc. (USA) . . . . [9473-8]

Information fusion performance evaluation for motion imagery data, Soundararajan Ezekiel, Indiana Univ. of Pennsylvania (USA) . . . . [9473-9]

Video rate 3D registration of airborne video, David Bottisti, Lockheed Martin Missiles and Fire Control (USA); Suresh Subramaniam, The George Washington Univ. (USA) . . . . [9473-10]

Incorporating structure from motion uncertainty into image-based pose estimation, Ben Ludington, Andrew P. Brown, Michael Sheffler, Toyon Research Corp. (USA) . . . . [9473-11]

Full motion video geopositioning algorithm integrated test bed, John T. Dolloff, Bryant M. Hottel, Peter J. Doucette, Aaron Braun, Henry J. Theiss, Adam Gurson, Integrity Applications, Inc. (USA). . . . . [9473-12]

Geostatistical modeling of uncertainty, simulation, and proposed applications in GIScience, Peter J. Doucette, John T. Dolloff, Integrity Applications, Inc. (USA). . . . . [9473-13]

SESSION 3 . . . . .TUE 10:30 AM TO 11:50 AM

Enabling Architectures for Multi-Dimensional/Multisensing GIS

Session Chair: **Peter J. Doucette,** Integrity Applications, Inc. (USA)

GeoMesa: a distributed architecture for multi-source spatio-temporal fusion, Anthony Fox, Commonwealth Computer Research, Inc. (USA). [9473-14]

Addressing fundamental architectural challenges of an activity based intelligence and advanced analytics (ABIAA) system, Matthew F. Pellechia, Kevin C. Yager, Thomas A. Albert, Bernard V. Brower, Shiloh L. Dockstader, Exelis Inc. (USA) . . . . [9473-15]

Technologies for on-the-move standoff explosive hazard detection, Sanjeev Agarwal, Ronald R. Rupp, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Bruce Swett, Chris Burnett, EOIR Technologies (USA) . . . . [9473-16]

Semantically enabled wide-area image search, May V. Casterline, Kolia Sadeghi, Timothy Emerick, Commonwealth Computer Research, Inc. (USA) . . . . [9473-17]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

PANEL DISCUSSION. . . . . 1:20 PM TO 3:00 PM

Anticipative Computing for Autonomous Sensing and Analytics: What is over the horizon?

Moderator: **Kannappan Palaniappan**, Univ. of Missouri-Columbus (USA)

SESSION 4 . . . . TUE 3:30 PM TO 5:10 PM

Geoinformatics Processing Exploitation and Visualization

Session Chair: **Matthew F. Pellechia,** Exelis Geospatial Systems (USA)

Effects of camera location on the reconstruction of 3D flare trajectory with two cameras, Seçkin Özsaraç, Muhammed Ye?ilkaya, TÜBİTAK BİLGEM İLTAREN (Turkey) . . . . [9473-18]

Learning based roof style classification in 2D satellite images from Illinois Institute of Technology, Andi Zang, Xi Zhang, Gady Agam, Illinois Institute of Technology (USA); Xin Chen, Nokia Here.com (USA) and Illinois Institute of Technology (USA) . . . . [9473-19]

Context exploitation in intelligence, surveillance, and reconnaissance for detection and tracking algorithms, Jonathan D. Tucker, Lockheed Martin Corp. (USA); Robert Stanfill, Lockheed Martin Missiles and Fire Control (USA) . . . . [9473-20]

Mosaicing with Poisson blending regularization for wide area motion imagery, V. B. Surya Prasath, Raphael Viguier, Kannappan Palaniappan, Univ. of Missouri-Columbia (USA); Gunasekaran Seetharaman, Air Force Research Lab. (USA) . . . . [9473-21]

Real-time automated detection, tracking, classification, and geolocation of dismounts using EO and IR FMV, Justin Muncaster, Toyon Research Corp. (USA) . . . . [9473-22]

SEE PROFESSIONAL DEVELOPMENT COURSES
pages 145–214

CONFERENCE 9474

Monday–Wednesday 20–22 April 2015 • Proceedings of SPIE Vol. 9474

Signal Processing, Sensor/Information Fusion, and Target Recognition XXIV

Conference Chair: **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA)

Conference Co-Chairs: **Erik P. Blasch,** Air Force Research Lab. (USA); **Kenneth Hintz,** George Mason Univ. (USA); **Thia Kirubarajan,** McMaster Univ. (Canada); **Ronald P. S. Mahler,** Consultant (USA)

Program Committee: **Mark G. Alford,** Air Force Research Lab. (USA); **Bhashyam Balaji,** Defence Research and Development Canada (Canada); **William D. Blair,** Georgia Tech Research Institute (USA); **Mark J. Carlotto,** General Dynamics Advanced Information Systems (USA); **Alex L. Chan,** U.S. Army Research Lab. (USA); **Kuo-Chu Chang,** George Mason Univ. (USA); **Chee-Yee Chong,** Independent Consultant (USA); **Marvin N. Cohen,** Georgia Tech Research Institute (USA); **Frederick E. Daum,** Raytheon Co. (USA); **Jean Dezert,** The French Aerospace Lab. (France); **Mohammad Farooq,** AA Scientific Consultants Inc (Canada); **Laurie H. Fenstermacher,** Air Force Research Lab. (USA); **Charles W. Glover,** Oak Ridge National Lab. (USA); **I. R. Goodman,** Consultant (USA); **Lynne L. Grewe,** California State Univ., East Bay (USA); **Michael L. Hinman,** Air Force Research Lab. (USA); **Jon S. Jones,** Air Force Research Lab. (USA); **Georgiy M. Levchuk,** Aptima, Inc. (USA); **Martin E. Liggins II,** Consultant (USA); **James Llinas,** Univ. at Buffalo (USA); **Raj P. Malhotra,** Air Force Research Lab. (USA); **Alastair D. McAulay,** Lehigh Univ. (USA); **Raman K. Mehra,** Scientific Systems Co., Inc. (USA); **Harley R. Myler,** Lamar Univ. (USA); **David Nicholson,** BAE Systems (United Kingdom); **Les Novak,** Scientific Systems Co., Inc. (USA); **John J. Salerno Jr.,** Air Force Research Lab. (USA); **Andrew G. Tescher,** AGT Associates (USA); **Stelios C. A. Thomopoulos,** National Ctr. for Scientific Research Demokritos (Greece); **Wiley E. Thompson,** New Mexico State Univ. (USA); **Shanchieh Jay Yang,** Rochester Institute of Technology (USA)

Monday 20 April

SESSION 1. . . . . .MON 8:30 AM TO 10:10 AM

Multisensor Fusion, Multitarget Tracking, and Resource Management I

Session Chairs: **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Thiagalingam Kirubarajan,** McMaster Univ. (Canada); **Kenneth Hintz,** George Mason Univ. (USA)

Comparison of the performance of some multiple target tracking algorithms with experimental airborne radar data, Bhashyam Balaji, Defence Research and Development Canada (Canada); Kai Wang, MacDonald, Dettwiler and Associates Ltd. (Canada); Anthony Damini, Defence Research and Development Canada (Canada) . . . . [9474-1]

Aspects of detection and tracking of surface targets from an airborne EO/IR sensor, Bhashyam Balaji, Zahir Daya, Defence Research and Development Canada (Canada) . . . . [9474-2]

Computationally efficient angles-only tracking with particle flow filters, Russell Costa, Thomas A. Wettergren, Naval Undersea Warfare Ctr. (USA) . . . . [9474-3]

Multisensor fusion for 3D target tracking using track-before-detect particle filter, Nima Moshtagh, Paul M. Romberg, Moses W. Chan, Lockheed Martin Space Systems Co. (USA). . . . . [9474-4]

Target visibility for multiple maneuvering target tracking, Madeleine G. Sabordo, Elias Aboutanios, The Univ. of New South Wales (Australia) . . [9474-5]

SESSION 2 . . . . .MON 10:40 AM TO 12:20 PM

Multisensor Fusion, Multitarget Tracking, and Resource Management II

Session Chairs: **Thiagalingam Kirubarajan,** McMaster Univ. (Canada); **Kenneth Hintz,** George Mason Univ. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA)

Robust approach for space-based sensor bias estimation in the presence of data association uncertainty, Djedjiga Belfadel, Richard Osborne, Yaakov Bar-Shalom, Univ. of Connecticut (USA) . . . . [9474-6]

Square-root formulation of the SVSF with target tracking applications, Stephen A. Gadsden, Univ. of Maryland, Baltimore County (USA). . . . . . [9474-7]

Minimum-variance smoother based on the SVSF estimation strategy, Stephen A. Gadsden, Univ. of Maryland, Baltimore County (USA); Thia Kirubarajan, McMaster Univ. (Canada) . . . . [9474-8]

Orchestrated management of heterogeneous sensors incorporating feedback from intelligence assets, Yugandhar Sarkale, Edwin K. P. Chong, Colorado State Univ. (USA). . . . . [9474-9]

Probabilistic track-to-track association for attribute data fusion, Tim Zajic, Raytheon Co. (USA) . . . . [9474-10]

Lunch Break . . . . .Mon 12:20 pm to 1:15 pm

DEFENSE + SECURITY

PANEL DISCUSSION . . . . .1:15 PM TO 4:45 PM

Issues and Challenges of the Applications of Context to Enhance Information Fusion

Session Chair: **Alex L. Chan,** U.S. Army Research Lab. (USA)

Panel Organizers: **Erik Blasch**, Air Force Research Lab. (USA); **Ivan Kadar**, Interlink Systems Sciences, Inc, (USA)

Panel Moderators: **Ivan Kadar,** Interlink Sciences Systems, Inc. (USA); **Chee-Yee Chong,** Independent Consultant (USA)

Panel Members: **Erik Blasch,** Air Force Research Lab. (USA); **Alex L. Chan,** U.S. Army Research Lab. (USA); **Chee-Yee Chong,** Independent Consultant (USA); **Laurie H. Fenstermacher**, Air Force Research Lab. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Ronald P. S. Mahler,** Consultant (USA); **Alan N. Steinberg,** Independent Consultant (USA); **Paul Tandy,** Defense Threat Reduction Agency (USA); **Shancheih Jay Yang,** Rochester Institute of Technology (USA)

For a given application contextual information represents prior domain knowledge about the setting of the scenario/process to commence. The contextual knowledge can be acquired from prior (historical) experience, provided by external sources (e.g., user), learned from process experience, e.g., context awareness, prediction and search; and can be updated/corrected if changes are detected, e.g., by machine learning.

Context is present in all aspects of processing and interpreting information, situation, data, text, imagery, target tracking/identification, web-analytics, and intelligence systems outputs, that is, in all aspects/levels of information fusion (IF). Context is a multi-faceted entity, and can represent a setting for the assessment/interpretation of an event, scene, presence, situation, condition, constraint, influence, and many other entities clearly scenario/application dependent. There is context within context. Furthermore, context is not a static entity and can change over time (e.g., operating conditions, environment, geography, weather, seasons, roads, traffic, attitudes, behavior, preferences) affecting the performance of a given application if not managed and taken into account. Therefore, it is important to incorporate contextual information at the outset in all IF levels and associated systems designs in order to enhance the performance of the overall IF system and the on-going application.

For example in tracking application one can describe at least five contextual categories: (1) domain knowledge from a user to aid the information fusion process through selection, cueing, and analysis, (2) environment-to-hardware processing for sensor management, (3) known distribution of entities for situation/threat assessment, (4) historical traffic behavior for situation awareness patterns of life (POL), and (5) road information for target tracking and identification. Appropriate characterization and representation of contextual information is needed for future high-level information fusion systems design to take advantage of the large data content available for a priori knowledge target tracking algorithm construction, implementation, and application.

The objective of this panel is to bring to the attention of the fusion community the importance of the application of contextual knowledge to enhance IF, highlighting issues, illustrating potential approaches and addressing challenges. A number of invited experts will discuss challenges of the fusion process and research to address these challenges. The panelists will illustrate parts of the above mentioned areas over different applications and address all levels of information fusion. Conceptual and real-world related examples associated with the use of context to enhance IF will be used by the panel to highlight impending issues and challenges.

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 3 . . . . .TUE 8:00 AM TO 11:10 AM

Information Fusion Methodologies and Applications I

Session Chair: **Ronald P.S. Mahler,** Consultant (USA)

CPHD filters with unknown quadratic clutter generators, Ronald P. S. Mahler, Consultant. (USA) . . . . [9474-11]

On multitarget pairwise-Markov models, Ronald P. S. Mahler, Consultant (USA) . . . . [9474-12]

Distributed fusion of multitarget densities and consensus PHD filters, Giorgio Battistelli, Luigi Chisci, Claudio Fantacci, Univ. degli Studi di Firenze (Italy); Alfonso Farina, Antonio Graziano, SELEX ES S.p.A. (Italy); Ronald P. S. Mahler, Consultant (USA) . . . . [9474-13]

A distributed general multisensor cardinalized probability hypothesis density (CPHD) filter for sensor networks, Mark Coates, Santosh Nannuru, Michael Rabbat, Syamantak Datta Gupta, McGill Univ. (Canada) . . . . . [9474-14]

Integrate knowledge acquisition with target recognition through closed-loop ATR, Ssu-Hsin Yu, Pat McLaughlin, Aleksandar Zatezalo, Scientific Systems Co., Inc. (USA) . . . . [9474-15]

Multi-threat orbital evasion, Aleksandar Zatezalo, Scientific Systems Co., Inc. (USA); Dusan M. Stipanovic, Univ. of Illinois at Urbana-Champaign (USA); Ssu-Hsin Yu, Raman K Mehra, Scientific Systems Co., Inc. (USA) . . . . [9474-16]

Distributed estimation and control for unmanned systems, Aleksandar Zatezalo, Scientific Systems Co., Inc. (USA); Dusan M. Stipanovic, Univ. of Illinois at Urbana-Champaign (USA); Ssu-Hsin Yu, Raman K. Mehra, Scientific Systems Co., Inc. (USA) . . . . [9474-17]

Stochastic geometry for space situational awareness, Ba-Ngu B. Vo, Ba-Tuong Vo, Curtin Univ. (Australia) . . . . [9474-18]

SESSION 4 . . . . TUE 11:10 AM TO 11:50 AM

Information Fusion Methodologies and Applications II

Session Chairs: **Chee-Yee Chong,** Independent Consultant (USA); **Michael L. Hinman,** Air Force Research Lab. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Kenneth Hintz,** George Mason Univ. (USA)

Proof that particle flow corresponds to Bayes' rule: necessary and sufficient conditions, Frederick E. Daum, Raytheon Co. (USA) . . . . . . [9474-19]

Eight new particle flows for nonlinear filters, Bayesian decisions and transport, Frederick E. Daum, Jim Huang, Raytheon Co. (USA) . . . . . . [9474-20]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 5 . . . . .TUE 1:20 PM TO 3:00 PM

Information Fusion Methodologies and Applications III

Session Chairs: **Chee-Yee Chong,** Independent Consultant (USA); **Michael L. Hinman,** Air Force Research Lab. (USA); **Ivan Kadar,** Interlink Systems Sciences, Inc. (USA); **Kenneth Hintz,** George Mason Univ. (USA)

Feynman path integral and Monte Carlo methods for nonlinear filtering, Bhashyam Balaji, Defence Research and Development Canada (Canada) . . . . [9474-21]

Feature-aided multiple hypothesis tracking using topological and statistical behavior classifiers, David M. Rouse, Johns Hopkins Univ Applied Physics Lab. (USA); Adam S. Watkins, Jonathan T. DeSena, Jesse C. Clarke, David W. Porter, Jeffrey Gilbert, Johns Hopkins Univ. Applied Physics Lab., LLC (USA); Paul Bendich, Nathaniel Strawn, Elizabeth Munch, John Harer, Duke Univ. (USA); Peter Chin, Draper Lab. (USA); Andrew J. Newman, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . . [9474-22]

OCULUS Sea Track fusion service, Stylianos C. Panagiotou, Constantinos Rizogiannis, Stavros Katsoulis, Vassilis Lampropoulos, Sotirios Kanellopoulos, Stelios C. A. Thomopoulos, National Ctr. for Scientific Research Demokritos (Greece) . . . . [9474-23]

OCULUS Sea: a maritime surveillance platform, Sotirios Kanellopoulos, Stavros Katsoulis, Dionysis Motos, Vassilis Lampropoulos, Christos Margonis, Kostantinos Dimitros, Stelios C. A. Thomopoulos, National Ctr. for Scientific Research Demokritos (Greece) . . . . [9474-24]

A technique for sensors fusion with limited number of common measures, Carlo Quaranta, Giorgio Balzarotti, SELEX ES S.p.A. (Italy) . . . . [9474-25]

SESSION 6 . . . . TUE 3:30 PM TO 6:00 PM

Information Fusion Methodologies and Applications III

Session Chairs: **Michael L. Hinman,** Air Force Research Lab. (USA); **Kenneth Hintz,** George Mason Univ. (USA); **Erik Blasch,** Air Force Research Lab. (USA); **Chee-Yee Chong,** Independent Consultant (USA)

Grid occupancy estimation for autonomous vehicle perception based on belief functions and a proportional conflict redistribution rule of combination, Julien Moras, Jean Dezert, Benjamin Pannetier, ONERA (France) . . . . [9474-26]

Issues and challenges of information fusion in contested environments panel, Erik Blasch, Air Force Research Lab. (USA); Ivan Kadar, Interlink Systems Sciences, Inc. (USA); Chee-Yee Chong, Independent Consultant (USA); Eric K. Jones, Systems & Technology Research (USA); Laurie H. Fenstermacher, Air Force Research Lab. (USA); John D. Gorman, Defense Advanced Research Projects Agency (USA); Georgiy M. Levchuk, Aptima, Inc. (USA); Jorge E. Tierno, Barnstorm Research Corp. (USA) . . . . [9474-27]

Multi-intelligence critical rating assessment of fusion techniques (MiCRAFT), Erik Blasch, Air Force Research Lab. (USA) . . . . [9474-28]

Data fusion, association, and retrieval in open-source multimedia, Georgiy M. Levchuk, Aptima, Inc. (USA). . . . . [9474-29]

Optimal fusion rules for label fusion of classification systems, Jim Fitch, Mark E. Oxley, Christine M. Schubert Kabban, Air Force Institute of Technology (USA) . . . . [9474-30]

Weighted Kullback-Leibler average-based distributed filtering algorithm, Kelin Lu, Beihang Univ. (China); Kuochu C. Chang, George Mason Univ. (USA); Rui Zhou, Beihang Univ. (China) . . . . [9474-31]

Categorification of the Dempster Shafer theory, Joseph J. Peri, Johns Hopkins Univ. Applied Physics Lab., LLC (USA). . . . . [9474-32]

INTERACTIVE POSTER SESSION
TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Obstacle detection for unmanned ground vehicle in outdoor environment, Tok Son Choe, Jin-Bae Park, Yonsei Univ. (Korea, Republic of); Sang Hyun Joo, Yong Woon Park, Agency for Defense Development (Korea, Republic of) . . . . [9474-52]

Fast HOG features extraction using circle filter for car detection in aerial images, Ang Su, Yueqiang Zhang, Qifeng Yu, Xiaohu Zhang, Yang Shang, Xiaochun Liu, National Univ. of Defense Technology (China) . . . . [9474-53]

Use of open space box: supporting tele-medicine in space through efficient data transmission, Atif F. Mohammad, Jeremy Straub, The Univ. of North Dakota (USA). . . . . [9474-54]

The challenges of implementing and testing two signal processing algorithms for high rep-rate coherent Doppler lidar for wind sensing, Sameh Abdelazim, Fairleigh Dickinson Univ. (USA); David Santoro, Mark F. Arend, Fred Moshary, Samir Ahmed, The City College of New York (USA) . . . . [9474-55]

On an efficiency and effective intelligent transportation system (ITS) safety and traffic efficiency applications with corresponding driver's behavior, Nnanna N. Ekedebe, Nicolas Dolphin, Towson Univ. (USA) . . . . [9474-56]

Magnetic dipole parameter estimation and tracking using extended Kalman filter, Bhashyam Balaji, Bradley J. Nelson, Defence Research and Development Canada (Canada). . . . . [9474-57]

Bearing and frequency estimation using Cardiod sensors, Bhashyam Balaji, Defence Research and Development Canada (Canada). . . . . [9474-58]

The cubature smooth variable structure filter application into a quad-copter, Mohammad Al-Shabi, Philadelphia Univ. (Jordan); Stephen A. Gadsden, Univ. of Maryland, Baltimore (USA). . . . . [9474-59]

Wednesday 22 April

SESSION 7 . . . . WED 8:00 AM TO 10:00 AM

Signal and Image Processing, and Information Fusion Applications I

Session Chairs: **Lynne L. Grewe,** California State Univ., East Bay (USA); **Mark J. Carlotto,** General Dynamics Advanced Information Systems (USA); **Mark G. Alford,** Air Force Research Lab. (USA)

Learning representations for improved target identification, scene classification, and information fusion, Arjuna Flenner, Jennifer Flenner, Naval Air Warfare Ctr. Weapons Div. (USA) . . . . [9474-33]

Effects of the experimental manipulation of Fourier components of naturalistic imagery on search performance and eye-tracking behavior, Alan R. Pinkus, Air Force Research Lab. (USA); James S. Garrett, Consortium Research Fellows Program (USA); Allan J. Pantle, Miami Univ. (USA) . . [9474-34]

Fast object detection for low powered ISR systems, Olegs Mise, GE Intelligent Platforms (USA); Lee D. Wren, GE Intelligent Platforms (United Kingdom) . . . . [9474-35]

An infrared-visible image fusion scheme based on NSCT and compressed sensing, Qiong Zhang, Xavier Maldague, Univ. Laval (Canada) . . . . . . [9474-36]

Model-based detection, segmentation, and classification of compact objects, Mark J. Carlotto, General Dynamics Advanced Information Systems (USA) . . . . [9474-37]

Change detection by extended image differencing applied to IR video, Günter Saur, Fraunhofer-Institut für Optronik, Systemtechnik und Bildauswertung (Germany) . . . . [9474-38]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours

SESSION 8 . . . . WED 1:00 PM TO 3:00 PM

Signal and Image Processing, and Information Fusion Applications II

Session Chairs: **Mark J. Carlotto,** General Dynamics Advanced Information Systems (USA); **Lynne L. Grewe,** California State Univ., East Bay (USA); **Mark G. Alford,** Air Force Research Lab. (USA)

Search by photo methodology for signature properties assessment by human observers, Gorm K. Selj, Daniela H. Heinrich, Norwegian Defence Research Establishment (Norway) . . . . [9474-39]

Cross-modal face recognition using multi-matcher face scores, Yufeng Zheng, Alcorn State Univ. (USA); Erik Blasch, Air Force Research Lab. (USA) . . . . [9474-40]

Dimensionality analysis of facial signatures in visible and thermal spectra, Nathaniel Short, Booz Allen Hamilton Inc. (USA); Shuowen Hu, U.S. Army Research Lab. (USA); Prudhvi Gurram, MBO Partners (USA). . . . . [9474-41]

Unsupervised classification of airborne particulate materials from optical scattering patterns, Giovanni Franco Crosta, Univ. degli Studi di Milano-Bicocca (Italy); Yongle Pan, Gorden Videen, U.S. Army Research Lab. (USA) . . . . [9474-42]

Muzzle flash localisation for the dismounted soldier, William J. Kennedy Scott, QinetiQ Ltd. (United Kingdom) . . . . [9474-43]

The Locus analytical framework for indoor localization and tracking applications, Olga E. Segou, Stelios C. A. Thomopoulos, National Ctr. for Scientific Research Demokritos (Greece) . . . . [9474-44]

SESSION 9 . . . . WED 3:30 PM TO 5:50 PM

Signal and Image Processing, and Information Fusion Applications III

Session Chairs: **Mark G. Alford,** Air Force Research Lab. (USA); **Mark J. Carlotto,** General Dynamics Advanced Information Systems (USA); **Lynne L. Grewe,** California State Univ., East Bay (USA)

Occlusion, optimization, emergency response and partial falls in a senior collapse detection system, Lynne L. Grewe, Steven Magaña-Zook, California State Univ., East Bay (USA). . . . . [9474-45]

Design for a source-agile automatic direction finder (ADF), Harley R. Myler, Lamar Univ. (USA) . . . . [9474-46]

Range resolution improvement in passive bistatic radars using nested FM channels and least squares approach, Rasim A. Sevimli, Musa T. Arslan, Ahmet E. Cetin, Bilkent Univ. (Turkey). . . . . [9474-47]

Vehicle engine classification using vibrations measured by laser Doppler vibrometer on pre-planted nearby objects, Jie Wei, Chi-Him Liu, Zhigang Zhu, The City College of New York (USA); Karmon M. Vongsy, Olga Mendoza-Schrock, Air Force Research Lab. (USA) . . . . [9474-48]

Exploitation of vibrometry data, Karmon M. Vongsy, Air Force Research Lab. (USA); Ashley N. Smith, Wright State Univ. (USA). . . . . [9474-49]

Comparing and contrasting Bayesian and Dempster-Shafer models of multisensor information fusion, Buddy H. Jeun, John R. Younker, Sensor Fusion Technology, LLC (USA) . . . . [9474-50]

Infrared small target detection algorithm based on multiscale codebook model, Lei Liu, Yayun Zhou, Nanjing Univ. of Science and Technology (China) . . . . [9474-51]

CONFERENCE 9475

Thursday 23 April 2015 • Proceedings of SPIE Vol. 9475

Algorithms for Synthetic Aperture Radar Imagery XXII

Conference Chairs: **Edmund Zelnio,** Air Force Research Lab. (USA); **Frederick D. Garber,** Wright State Univ. (USA)

Program Committee: **David Blacknell,** Defence Science and Technology Lab. (United Kingdom); **Mujdat Cetin,** Sabanci Univ. (Turkey); **Gil J. Ettinger,** Systems & Technology Research (USA); **Charles V. Jakowatz Jr.,** Sandia National Labs. (USA); **Eric R. Keydel,** SAIC (USA); **Juan Li,** Univ. of Central Florida (USA); **Michael J. Minardi,** Air Force Research Lab. (USA); **Randolph L. Moses,** The Ohio State Univ. (USA); **Les Novak,** Scientific Systems Co., Inc. (USA); **Lee C. Potter,** The Ohio State Univ. (USA); **Brian Rigling,** Wright State Univ. (USA); **Timothy D. Ross,** Jacobs Technology (USA); **Gerard W. Titi,** BAE Systems (USA)

Thursday 23 April

CONFERENCE WELCOME . . . . 8:00 AM TO 8:10 AM

SESSION 1. . . . . THU 8:10 AM TO 9:30 AM

Advanced SAR Imaging and Moving Target Detection

Session Chair: **Jason T. Parker,** Air Force Research Lab. (USA)

Ultra-narrowband SAR imaging using low-rank matrix recovery techniques, Eric Mason, Birsen Yazici, Rensselaer Polytechnic Institute (USA); Uttam Majumder, Edmund G. Zelnio, Air Force Research Lab. (USA) . . . . [9475-1]

Analysis and sharpening of radar image reconstruction via debiasing the lasso, Il-Young Son, Birsen Yazici, Rensselaer Polytechnic Institute (USA); Edmund G. Zelnio, Uttam Majumder, Air Force Research Lab. (USA) . . . [9475-2]

Optimized data sample for SAR imaging with irregular coverage, Thorkild B. Hansen, Seknion, Inc. (USA); Ross W. Deming, Solid State Scientific Corp. (USA) . . . . [9475-3]

Gradient projection for interrupted SAR using the polar format algorithm, Ross W. Deming, Solid State Scientific Corp. (USA); Chad Knight, Space Dynamics Lab. (USA) and Utah State Univ. (USA) . . . . [9475-4]

Back projection based Bistttic SAR DCPA for moving target imaging, Kaan Duman, Birsen Yazici, Rensselaer Polytechnic Institute (USA). . . . . [9475-5]

Knowledge-aided GMTI in a Bayesian framework, Michael Riedl, Lee C. Potter, The Ohio State Univ. (USA) . . . . [9475-6]

ATI design considerations to maximize SAR and GMTI performance, Chad Knight, Space Dynamics Lab. (USA); Ross W. Deming, Solid State Scientific Corp. (USA) . . . . [9475-7]

Geolocation of moving targets in gotcha data using multimode processing, Unnikrishna Pillai, Polytechnic Institute of New York Univ. (USA); Ke Yong Li, C&P Technologies, Inc. (USA); Steven M. Scarborough, Air Force Research Lab. (USA) . . . . [9475-8]

SESSION 2 . . . . THU 9:30 AM TO 11:50 AM

Recognition, Detection, and Signature Analysis usin gSAR

Session Chair: **Christopher Paulson,** Air Force Research Lab. (USA)

A new polarimetric maximum-likelihood change estimator for two-pass SAR coherent change detection, David A. Yocky, Daniel E. Wahl, Charles V. Jakowatz Jr., Sandia National Labs. (USA). . . . . [9475-9]

SAR image statistics and adaptive signal processing for change detection, Viet T. Vu, Renato Machado, Mats I. Pettersson, Blekinge Institute of Technology (Sweden); Patrik Dammert, Hans Hellsten, Saab Electronic Defence Systems (Sweden). . . . . [9475-10]

Signature predictions of surface targets undergoing turning maneuvers in spotlight synthetic aperture radar imagery, David A. Garren, Naval Postgraduate School (USA). . . . . [9475-11]

Joint azimuth and elevation localization estimates in 3D synthetic aperture radar scenarios, Matthew P. Pepin, Sandia Staffing Alliance, LLC (USA) . . . . [9475-12]

Characterization of stationary and moving shadows in synthetic aperture radar imagery, John Miller, Edward Bishop, General Atomics Aeronautical Systems, Inc. (USA); Armin W. Doerry, Ann M. Raynal, Sandia National Labs. (USA) . . . . [9475-13]

Asymptotic modeling of synthetic aperture ladar sensor phenomenology, Robert Neuroth, Air Force Research Lab. (USA); Brian D. Rigling, Wright State Univ. (USA); Edmund G. Zelnio, Air Force Research Lab. (USA); Edward A. Watson, Univ. of Dayton Research Institute (USA); Vincent J. Velten, Todd V. Rovito, Air Force Research Lab. (USA) . . . . [9475-14]

Layover analysis in synthetic aperture radar images, Ling Wang, Nanjing Univ. of Aeronautics and Astronautics (China); Birsen Yazici, Rensselaer Polytechnic Institute (USA) . . . . [9475-15]

Deep convolutional neural networks for ATR from SAR imagery, David A. E. Morgan, BAE Systems (United Kingdom) . . . . [9475-16]

Mixture of factor analyzers models of appearance manifolds for resolved SAR targets, Tarek Abdelrahman, Emre Ertin, The Ohio State Univ. (USA) . . . . [9475-17]

Sensitivity to number of quantization levels on quantization based ATR algorithm, Matt S. Horvath, Brian D. Rigling, Wright State Univ. (USA). [9475-18]

Impact of phase of radar range profiles in target classification, Linda J. Moore, Air Force Research Lab. (USA) and Univ. of Dayton (USA); Brian D. Rigling, Wright State Univ. (USA); Robert P. Penno, Univ. of Dayton (USA) . . . . [9475-19]

Lunch/Exhibition Break . . . . Thu 12:00 pm to 1:50 pm

POSTER SESSION . . . . 1:50 PM TO 3:30 PM

DISCUSSION/WORKSHOP . . . . 4:00 PM TO 4:50 PM

CONFERENCE 9476

Monday–Thursday 20–23 April 2015 • Proceedings of SPIE Vol. 9476

Automatic Target Recognition XXV

Conference Chairs: **Firooz A. Sadjadi,** Lockheed Martin Advanced Technology Labs. (USA); **Abhijit Mahalanobis,** Lockheed Martin Missiles and Fire Control (USA)

Program Committee: **Mohammad S. Alam,** Univ. of South Alabama (USA); **Farid Amoozegar,** Jet Propulsion Lab. (USA); **Mahmood R. Azimi-Sadjadi,** Colorado State Univ. (USA); **David Casasent,** Carnegie Mellon Univ. (USA); **Leon Cohen,** Hunter College (USA); **Frederick D. Garber,** Wright State Univ. (USA); **Guillermo C. Gaunaurd,** Consultant (USA); **Izidor Gertner,** The City College of New York (USA); **Patti S. Gillespie,** U.S. Army Research Lab. (USA); **Riad I. Hammoud,** BAE Systems (USA); **Bahram Javidi,** Univ. of Connecticut (USA); **Ismail I. Jouny,** Lafayette College (USA); **Behzad Kamgar-Parsi,** U.S. Naval Research Lab. (USA); **Timothy J. Klausutis,** Air Force Research Lab. (USA); **Wolfgang Kober,** Data Fusion Corp. (USA); **Aaron D. Lanterman,** Georgia Institute of Technology (USA); **Randolph L. Moses,** The Ohio State Univ. (USA); **Robert R. Muise,** Lockheed Martin Missiles and Fire Control (USA); **Nasser M. Nasrabadi,** U.S. Army Research Lab. (USA); **Les Novak,** Scientific Systems Co., Inc. (USA); **Joseph A. O'Sullivan,** Washington Univ. in St. Louis (USA); **Mubarak Ali Shah,** Univ. of Central Florida (USA); **Andre U. Sokolnikov,** Visual Solutions and Applications (USA); **Alan J. Van Nevel,** Naval Air Warfare Ctr. Aircraft Div. (USA); **Bradley C. Wallet,** Automated Decisions LLC (USA); **Edmund Zelnio,** Air Force Research Lab. (USA)

Monday 20 April

SESSION 1. . . . . MON 8:30 AM TO 9:50 AM

New Methodologies in ATR I

Session Chair: **Firooz A. Sadjadi,** Lockheed Martin Corp. (USA)

Target classification strategies, Bruce J. Schachter, Northrop Grumman Electronic Systems (USA) . . . . [9476-1]

Mutual information for enhanced feature selection in visual tracking, Victor Stamatescu, Anthony Milton, Univ. of South Australia (Australia); Sebastien Wong, Defence Science and Technology Organisation (Australia); Ivan Lee, David Kearney, Univ. of South Australia (Australia). . . . . [9476-2]

The effect of contrast in camouflage patterns on detectability by human observers and CAMAELEON, Daniela H. Heinrich, Gorm K. Selj, Norwegian Defence Research Establishment (Norway) . . . . [9476-3]

Evaluation methodology for query-based scene understanding systems, Todd P. Huster, Jacobs Engineering Group Inc. (USA) and Air Force Research Lab. (USA); Timothy D. Ross, Jacobs Engineering Group Inc. (USA) and Air Force Research Lab. (USA); Jared L. Culbertson, Air Force Research Lab. (USA) . . . . [9476-4]

SESSION 2 . . . . MON 10:20 AM TO 11:50 AM

New Methodologies in ATR II

Session Chair: **Abhijit Mahalanobis,** Lockheed Martin Missiles and Fire Control (USA)

Ambiguities of instantaneous frequency, and complex signal representations through pole-zero manipulations *(Invited Paper)*, Patrick J. Loughlin, Univ. of Pittsburgh (USA). . . . . [9476-5]

A novel method for determining target detection thresholds, Stanley I. Grossman, National Geospatial-Intelligence Agency (USA) . . . . . . [9476-6]

Shape-based features for ship classification, Katie Rainey, Erin Spindle, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9476-7]

Sparsity-driven anomaly detection for ship detection and tracking in maritime video, Joshua D. Harguess, Scott Shafer, Pedro Forero, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9476-8]

Lunch/Exhibition Break . . . . Mon 11:50 am to 1:20 pm

SESSION 3 . . . . MON 1:20 PM TO 2:40 PM

New Methodologies in ATR III

Session Chair: **Izidor Gertner,** The City College of New York (USA)

Vessel classification in overhead satellite imagery using weighted "bag of visual words", Shibin Parameswaran, Katie Rainey, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9476-9]

Segmentation and tracking of electrokinetic particles in microscopic video, Qiang Le, Hampton Univ. (USA); Shizhi Qian, Old Dominion Univ. (USA) . . . . [9476-10]

Shape distance transform for morphological filtering and landing site selection, Bing C. Li, Lockheed Martin Systems Integration-Owego (USA) . . . . [9476-11]

An approach to automatic detection of suspicious individuals in a crowd, Stephen Lucci, Satabdi Mukherjee, Izidor Gertner, The City College of New York (USA) . . . . [9476-12]

SESSION 4 . . . . MON 3:20 PM TO 4:20 PM

Radar/SAR ATR

Session Chair: **Firooz A. Sadjadi,** Lockheed Martin Corp. (USA)

Empirical evaluation of standard tracking process models and proposed enhancements, Bhargav R. Avasarala, Northrop Grumman Corp. (USA); Ryan Turner, Steven Bottone, Northrop Grumman Corp. (USA); Clay J. Stanek, Northrop Grumman Corp. (USA) . . . . [9476-13]

Aided target recognition using hyperdimensional manifolds, Shih-Chi K. Chen, Robert Stanfill, Abhijit Mahalanobis, Lockheed Martin Missiles and Fire Control (USA). . . . . [9476-14]

Feature analysis and saliency characterization for SAR ATR of civilian vehicles, Aaron McCauley, Julie Ann Jackson, Brian Woolley, Michael Seal, Air Force Institute of Technology (USA) . . . . [9476-15]

DSS PLENARY PRESENTATION . . MON 5:00 PM TO 6:00 PM

Alan R. Shaffer
Principal Deputy Assistant Secretary of Defense Research and Engineering
Department of Defense

Tuesday 21 April

SESSION 5 . . . . TUE 8:00 AM TO 9:50 AM

Underwater/Acoustic/Sonar ATR

Enhanced target versus clutter discrimination using time-frequency (LTV) filters *(Invited Paper)*, Vikram T. Gomatam, Patrick J. Loughlin, Univ. of Pittsburgh (USA) . . . . [9476-16]

Stereo image segmentation with application in underwater fish detection and tracking, Madhuri Gundam, Dimitrios Charalampidis, George E. Ioup, Juliette W. Ioup, Univ. of New Orleans (USA); Charles H. Thompson, National Marine Fisheries Service (USA) . . . . [9476-17]

Types and classification of noises *(Invited Paper)*, Leon Cohen, Hunter College (USA) . . . . [9476-18]

Why the inverse scattering by topological sensitivity may work, Bojan Guzina, Fatemeh Pourahmadian, Univ. of Minnesota, Twin Cities (USA)[9476-19]

Knowledge-directed adaptive automated underwater sonar mine detection and classification, Firooz A. Sadjadi, Lockheed Martin Corp. (USA) . . [9476-20]

SESSION 6 . . . . .TUE 10:30 AM TO 11:50 AM

Infrared-based ATR

Session Chair: **Abhijit Mahalanobis,**
Lockheed Martin Missiles and Fire Control (USA)

Performance of quantization-based ATR algorithms, Matt S. Horvath, Brian D. Rigling, Wright State Univ. (USA) . . . . [9476-21]

Performance and time requirement analysis of top-hat transform based small target detection, Ozan Yardımcı, Roketsan Roket Sanayii ve Ticaret A.S. (Turkey); Ilkay Ulusoy Parnas, Middle East Technical Univ. (Turkey); Seyit Tunc, Roketsan Roket Sanayii ve Ticaret A.S. (Turkey) . . . . [9476-22]

An evaluation of open set recognition for FLIR images, Matthew Scherreik, Brian D. Rigling, Wright State Univ. (USA) . . . . [9476-23]

Automatic solar panel recognition and defect detection using infrared imaging, Xiang Gao, Eric Munson, Arizona State Univ. (USA); Glen Abousleman, General Dynamics C4 Systems (USA); Jennie Si, Arizona State Univ. (USA). . . . . [9476-24]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:30 pm

Award Presentation . . . . 1:30 PM TO 1:40 PM

2015 ATR BEST PAPER AWARD

Session Chair: **Firooz A. Sadjadi,**
Lockheed Martin Advanced Technology Labs. (USA)

Lockheed Martin Corporation has generously offered to sponsor the Best Paper Awards for the Automatic Target Recognition (ATR) conference. Two awards are planned: the first is the overall Best Paper Award, and the second is a Best Student Paper Award.

Award Sponsored by

LOCKHEED MARTIN

SESSION 7 . . . . TUE 1:40 PM TO 5:40 PM

Advanced Concepts on ATR I

Session Chair: **Andre U. Sokolnikov,**
Visual Solutions and Applications (USA)

Estimation, tracking and geolocation of maritime burst signals from a single receiver *(Invited Paper)*, Douglas J. Nelson, National Security Agency (USA); Jeffrey N. Townsend, U.S. Dept. of Defense (USA) . . . . [9476-25]

Multisensor fusion with the ramification algorithm *(Invited Paper)*, Andre U. Sokolnikov, Visual Solutions and Applications (USA) . . . . [9476-26]

Distributed estimation of a parametric field with random sensor placements *(Invited Paper)*, Marwan Alkhweldi, Zhicheng Cao, Natalia A. Schmid, West Virginia Univ. (USA) . . . . [9476-27]

New algorithms for de-dispersion and signal detection in PAFs: experimenting with inferential statistics *(Invited Paper)*, Natalia A. Schmid, West Virginia Univ. (USA) . . . . [9476-28]

Composite multi-lobe descriptor for cross spectral face recognition: matching active IR to visible light images *(Invited Paper)*, Zhicheng Cao, Natalia A. Schmid, West Virginia Univ. (USA) . . . . [9476-29]

Identification of partially occluded firearms through partonomy *(Invited Paper)*, Nikolay M. Sirakov, Texas A&M Univ.-Commerce (USA) . . . . . . [9476-30]

Ramification algorithm for graphene sample-defect localization *(Invited Paper)*, Andre U. Sokolnikov, Visual Solutions and Applications (USA) . [9476-31]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

An estimation of distribution method for dynamic programming algorithm based on Copulas, Shuo Wang, Yiqun Zhang, China Aerospace Science & Industry Corp. (China) . . . . [9476-32]

Fast algorithm of infrared small target detection in jitter background, Weiping Yang, Xinping Lu, Jicheng Li, National Univ. of Defense Technology (China) . . . . [9476-33]

Image feature extraction based multiple ant colonies cooperation, Zhilong Zhang, Weiping Yang, Jicheng Li, National Univ. of Defense Technology (China) . . . . [9476-34]

Spherical Gaussian mixture model and object tracking system for PTZ camera, Hwangbo Seok, Chan-Su Lee, Yeungnam Univ. (Korea, Republic of) . . . . [9476-35]

Improved Boolean map visual theory based IR ground target detection, Yun-Ji Lim, Sungho Kim, Yeungnam Univ. (Korea, Republic of) . . . . . . [9476-36]

Wednesday 22 April

SESSION 8 . . . . WED 8:00 AM TO 12:30 PM

Advanced Concepts on ATR II

Session Chair: **Andre U. Sokolnikov,**
Visual Solutions and Applications (USA)

Metal-organic hybrid metamaterial THz imaging detectors etching, dramitically increasing the speed and lowering the cost of production of such FPAs *(Invited Paper)*, Dragoslav Grbovic, Fabio Alves, Gamani Karunasiri, Naval Postgraduate School (USA). . . . . [9476-37]

THz devices based on 2D electron systems *(Invited Paper)*, Huili Grace Xing, Univ. of Notre Dame (USA) . . . . [9476-38]

Graphene active plasmionics for terahertz device applications *(Invited Paper)*, Taiichi Taiichi Otsuji, Tohoku Univ. (Japan) . . . . [9476-39]

Terahertz nonlinear optics of graphene and 3D topological insulators *(Invited Paper)*, Alexey A. Belyanin, Texas A&M Univ. (USA); Xianghan Yao, Mikhail D. Tokman, Institute of Applied Physics (Russian Federation) . . [9476-40]

Electronics above 100 GHz *(Invited Paper)*, William D. Palmer, Microsystem Technology Office (USA) . . . . [9476-41]

Toward low-loss, infrared and THz nanophotonics and metamaterials: surface photon polariton modes in polar dielectric crystals *(Invited Paper)*, Joshua D. Caldwell, U.S. Naval Research Lab. (USA) . . . . [9476-42]

Terahertz science and technology of carbon nanomaterials *(Invited Paper)*, Junichiro Kono, Rice Univ. (USA) . . . . [9476-43]

CONFERENCE 9477

Wednesday–Thursday 22–23 April 2015 • Proceedings of SPIE Vol. 9477

Optical Pattern Recognition XXVI

Conference Chairs: **David Casasent,** Carnegie Mellon Univ. (USA); **Mohammad S. Alam,** Univ. of South Alabama (USA)

Program Committee: **Vijayan K. Asari,** Univ. of Dayton (USA); **Tien-Hsin Chao,** Jet Propulsion Lab. (USA); **Katsushi Ikeuchi,** The Univ. of Tokyo (Japan); **Bahram Javidi,** Univ. of Connecticut (USA); **Jed Khoury,** Lardec Inc. (USA); **Wesam A. Sakla,** Air Force Research Lab. (USA); **Yunlong Sheng,** Univ. Laval (Canada); **Robert C. Stirbl,** Jet Propulsion Lab. (USA); **Ashit Talukder,** National Institute of Standards and Technology (USA); **B. V. K. Vijaya Kumar,** Carnegie Mellon Univ. (USA); **Rupert C. Young,** Univ. of Sussex (United Kingdom)

Wednesday 22 April

SESSION 1. . . . . WED 8:30 AM TO 10:30 AM

Invited Session

Session Chair: **David Casasent,** Carnegie Mellon Univ. (USA)

Holographic 3D tracking of microscopic tools *(Invited Paper)*, Jesper Glückstad, Technical Univ. of Denmark (Denmark). . . . . [9477-1]

Efficient live-face detection to counter spoof attack in face recognition systems *(Invited Paper)*, Bikram K. Biswas, Mohammad S. Alam, Univ. of South Alabama (USA) . . . . [9477-2]

Recent results of a medium wave infrared compressive imaging sensor *(Invited Paper)*, Richard Shilling, Robert R. Muise, Lockheed Martin Missiles and Fire Control (USA) . . . . [9477-3]

Advanced big data research through measurements and multi-stakeholder evaluations *(Invited Paper)*, Ashit Talukder, National Institute of Standards and Technology (USA) . . . . [9477-4]

DEDICATED EXHIBITION TIME AND LUNCH BREAK
10:00 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 2 . . . . .WED 1:00 PM TO 2:30 PM

Distortion Invariant Filters: Techniques and Applications

Session Chair: **Rupert Young,** Univ. of Sussex (United Kingdom)

Comparison of spatial domain optimal trade-off maximum average correlation height (OT-MACH) with scale invariant feature transform (SIFT) using images with poor contrast and large illumination gradient *(Invited Paper)*, Akber A. Gardezi, COMSATS Institute of Information Technology (Pakistan) and Univ. of Sussex (United Kingdom); Tabassum-Ur-Razaq Qureshi, Ahmad T. Alkandri, Rupert Young, Philip Birch, Christopher Chatwin, Univ. of Sussex (United Kingdom) . . . . [9477-5]

A robust fringe-adjusted joint transform correlator for efficient object detection, Paheding Sidike, Vijayan K. Asari, Univ. of Dayton (USA); Mohammad S. Alam, Univ. of South Alabama (USA) . . . . [9477-6]

Framework for crowd detection through correlation filters, Saad Rehman, National Univ. of Sciences and Technology (Pakistan); Rupert Young, Univ. of Sussex (United Kingdom) . . . . [9477-7]

Object detection in color images with extended maximum average correlation height filter, Sharif M. A. Bhuiyan, Jesmin F. Khan, Tuskegee Univ. (USA); Mohammad S. Alam, Univ. of South Alabama (USA). . . . . [9477-8]

SESSION 3 . . . . .WED 2:30 PM TO 3:30 PM

Novel Detection Techniques

Session Chair: **Jed Khoury,** Lartec, Inc. (USA)

Simulation of pattern and defect detection in periodic amplitude and phase structures using photo-refractive four-wave mixing, Georges T. Nehmetallah, The Catholic Univ. of America (USA); Partha P. Banerjee, Univ. of Dayton (USA); Jed Khoury, Air Force Research Lab. (USA) . . . . [9477-9]

Efficient thermal image segmentation through integration of nonlinear intensity enhancement with unsupervised active contour model, Fatema A. Albalooshi, Evan Krieger, Paheding Sidike, Vijayan K. Asari, Univ. of Dayton (USA) . . . . [9477-10]

An improved algorithm for pedestrian detection, Prakash Duraisamy, Rochester Institute of Technology (USA); Amr Elgendy, Alexandria Univ. (Egypt) . . . . [9477-11]

SESSION 4 . . . . WED 4:00 PM TO 6:00 PM

Classification and Recognition Techniques

Session Chair: **Wesam A. Sakla,** Air Force Research Lab. (USA)

Gaussian-weighted neighborhood connectivity of nonlinear line attractor for learning complex manifolds, Theus Aspiras, Univ. of Dayton (USA); Wesam A. Sakla, Air Force Research Lab. (USA); Vijayan K. Asari, Univ. of Dayton (USA). . . . . [9477-12]

Volume component analysis for classification of lidar data, Nina M. Varney, Vijayan K. Asari, Univ. of Dayton (USA). . . . . [9477-13]

Machine vision for airport runway identification, Matt Schubert, Andrew J. Moore, Chester Dolph, Glenn Woodell, NASA Langley Research Ctr. (USA) . . . . [9477-14]

Road sign recognition using Viapix module and correlation technique, Yousri Ouerhani, ISEN Brest (France) and ACTRIS (France); M. Desthieux, ACTRIS (France) and ISEN Brest (France); Ayman Alfalou, ISEN Brest (France) . . . . [9477-15]

Fourier transform-based method for pattern matching: affine invariance and beyond, Madhuri Gundam, Dimitrios Charalampidis, Univ. of New Orleans (USA) . . . . [9477-16]

An empirical comparison of K-SVD and GMRA for dictionary learning, Vipin Vijayan, Univ. of Notre Dame (USA); Wesam A. Sakla, Air Force Research Lab. (USA) . . . . [9477-17]

Thursday 23 April

SESSION 5 . . . . THU 8:40 AM TO 10:00 AM

Applications

Session Chairs: **Mohammad S. Alam,** Univ. of South Alabama (USA); **Tien-Hsin Chao,** Jet Propulsion Lab. (USA)

Numerical implementation of the multiple-image optical compression and encryption technique, Yousri Ouerhani, ACTRIS (France) and ISEN Brest (France); Mohammed R. Aldossari, Ayman Alfalou, ISEN Brest (France); Christian Brosseau, Univ. de Bretagne Occidentale (France). . . . . [9477-18]

Night time monitoring using registration of RGB cameras and infrared cameras, Prakash Duraisamy, Rochester Institute of Technology (USA) . . . . [9477-19]

Calculation of key reduction for B92 QKD protocol, Miralem Mehic, Miroslav Voznak, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . . [9477-20]

Adaptive threshold and error-correction coding for robust data retrieval in optical media, Thomas T. Lu, Jet Propulsion Lab. (USA); Colin Costello, California State Polytechnic Univ., Pomona (USA); Matthew Ginley-Hidinger, Occidental College (USA); Tien-Hsin Chao, Jet Propulsion Lab. (USA) . [9477-21]

SESSION 6 . . . . THU 10:30 AM TO 12:00 PM

Novel Optical Memory Systems and New Spatial Light Modulators

Session Chairs: **Tien-Hsin Chao,** Jet Propulsion Lab. (USA); **Jed Khoury,** Lartec, Inc. (USA)

Alignment-free all solid state multiplexed holographic memory systems and applications *(Invited Paper)*, Stuart Yin, The Pennsylvania State Univ. (USA); Claire Luo, General Opto Solutions, LLC (USA). . . . . [9477-22]

Real-time content addressable holographic memory, Tien-Hsin Chao, Thomas T. Lu, George F. Reyes, Jet Propulsion Lab. (USA) . . . . [9477-23]

Design and optimization of an optically driven, deformable mirror device under DC bias, Jarrett Vella Jr., Jed Khoury, Bahareh Haji-saeed, Air Force Research Lab. (USA) . . . . [9477-24]

Prototyping honeycomb deformable mirror actuated optically through a cascade with a heterojunction detector, Jarrett Vella Jr., Jed Khoury, Air Force Research Lab. (USA). . . . . [9477-25]

THURSDAY EVENING . . . . 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

A new method of pose estimate of non-cooperative target without feature tracking, Jie Liu, Huazhong Univ. of Science and Technology (China); Zongming Liu, Shan Lu, Shanghai Key Lab. of Aerospace Intelligent Control Technology (China) and Shanghai Academy of Space Flight Technology (China); Nong Sang, Huazhong Univ. of Science and Technology (China) . . . . . [9477-26]

Pose estimation of non-cooperative targets based on docking surface, Wenkai Du, Huazhong Univ. of Science and Technology (China); Zongming Liu, Yu Zhang, Shuqing Cao, Shanghai Academy of Space Flight Technology (China); Nong Sang, Huazhong Univ. of Science and Technology (China) . . . . [9477-27]

Detection of weak edges using image registration, Prakash Duraisamy, Rochester Institute of Technology (USA) . . . . [9477-28]

Invariant correlation filters with peak stability parameter in problem of scaled objects recognition, Petr A. Ivanov, Yaroslavl State Univ. (Russian Federation) . . . . [9477-29]

Real-time holographic heterodyne spatial filtering, Jed Khoury, Lartec, Inc. (USA) . . . . [9477-30]

CONFERENCE 9478

Tuesday 21 April 2015 • Proceedings of SPIE Vol. 9478

Modeling and Simulation for Defense Systems and Applications X

Conference Chair: **Eric J. Kelmelis,** EM Photonics, Inc. (USA)

Program Committee: **James P. Durbano,** Northrop Grumman (USA); **James N. Elele,** Naval Air Systems Command (USA); **Susan Harkrider,** U.S. Army Night Vision & Electronic Sensors Directorate (USA); **Jonathan D. Rogers,** Georgia Institute of Technology (USA); **Robert Wright,** Capella Univ. (USA); **Chen Wu,** Defence Research and Development Canada, Ottawa (Canada)

TUESDAY 21 APRIL

SESSION 1. . . . . .TUE 8:40 AM TO 10:00 AM

Mobile and Communications

Secure communication systems using synchronized Lorenz strange attractor on reconfigurable hardware, Marc M. Sepantaie, Esam El-Araby, Georges Nehmatallah, Nader M. Namazi, Amir M. Sepantaie, The Catholic Univ. of America (USA) . . . . [9478-1]

Dynamic fair node spectrum allocation for ad hoc networks using random matrices, Mark D. Rahmes, George Lemieux, Dave Chester, Harris Corp. (USA); Jerome Sonnenberg, Harris Corp. GCSD (USA) . . . . [9478-2]

Certificate based key agreement among LTE entities for secure handover, Divya Mohan, B. Sridevi, Velammal College of Engineering and Technology (India) . . . . [9478-3]

Weaknesses in Android certificate security, Daniel E. Krych, Stephen Lange-Maney, Patrick McDaniel, The Pennsylvania State Univ. (USA); William Glodek, U.S. Army Research Lab. (USA) . . . . [9478-4]

SESSION 2 . . . . .TUE 10:30 AM TO 11:50 AM

Algorithms, Platforms, and Tools

Adaptive OpenCL libraries for platform portability, Paul A. Fox, Allyssa L. Batten, Stephen Kozacik, Eric J. Kelmelis, EM Photonics, Inc. (USA) . . . [9478-5]

Enhanced NVESD EO/IR sensor acquisition life cycle test and evaluation process, Jonathan G. Hixson, Christopher May, U.S. Army Night Vision & Electronic Sensors Directorate (USA) . . . . [9478-6]

An evaluation of algorithms and methods for compressing and decompressing atmospheric transmission data for use in at-sensor measurements, Mark H. Van Benthem, Drew P. Woodbury, Sandia National Labs. (USA) . . . . [9478-7]

Power aware computing: a directive-based approach, Paul A. Fox, Stephen Kozacik, James Bonnett, Eric J. Kelmelis, EM Photonics, Inc. (USA). . . . [9478-8]

Lunch/Exhibition Break . . . . Tue 11:50 am to 1:20 pm

SESSION 3 . . . . .TUE 1:20 PM TO 3:00 PM

Systems and Environments I

A reference model for critical infrastructure protection system (CIPS), YoungDon Shin, Samsung Thales Co., Ltd. (Korea, Republic of); Cheol-Young Park, George Mason Univ. (USA); Jae-Chon Lee, Ajou Univ. (Korea, Republic of) . . . . [9478-9]

Modeling and simulation of infrastructure resiliency against man-made hazards, Yahia Al-Smadi, Texas A&M Univ.-Kingsville (USA) . . . . [9478-10]

Focus on connections for successful organizational transformation to model based engineering, Guy Babineau, Northrop Grumman Corp. (USA) . . . . [9478-11]

The effectiveness of the jammer signal characteristics on Conical-Scan systems, Mehmet C. Sahingil, Murat S. Aslan, TÜBİTAK BİLGEM İLTAREN (Turkey) . . . . [9478-12]

Understanding the impact of blasts from explosions on MEMS, Yahia Al-Smadi, Texas A&M Univ.-Kingsville (USA) . . . . [9478-13]

SESSION 4 . . . . .TUE 3:30 PM TO 5:10 PM

Systems and Envrionments II

Target detection and tracking in maritime surveillance mission, Madeleine G. Sabordo, Elias Aboutanios, The Univ. of New South Wales (Australia). . . . . [9478-14]

Virtual sensor tracking using byzantine fault tolerance and predictive outlier model for complex tasks recognition, Vasanth Iyer, Sachin Shetty, Tennessee State Univ. (USA) . . . . [9478-15]

Metamaterial based narrowband perfect absorbers, Ahmed S. Sharkawy, Mathew Zablocki, Lumilant, Inc. (USA) . . . . [9478-16]

The use of a low-cost, visible light 3D scanner to create virtual reality environment models of actors and objects, Jeremy Straub, Univ. of North Dakota (USA). . . . . [9478-17]

Physical environment virtualization test bed for human activities recognition, Azin Poshtkar, Vinayak Elangovan, Amir Shirkhodaie, Tennessee State Univ. (USA); Alex L. Chan, Shuowen Hu, U.S. Army Research Lab. (USA) . . . . [9478-18]

INTERACTIVE POSTER SESSION

TUESDAY EVENING. 6:00 PM TO 7:30 PM

All symposium attendees – You are invited to attend the evening Interactive Poster Session to view the high-quality posters and engage the authors in discussion. Enjoy light refreshments while networking with colleagues in your field. Authors may set up their posters between 7:30 am and 12:00 noon the day of their poster session. Special daytime previewing prior to the session from 12:00 noon to 4:30 pm. Attendees are required to wear their conference registration badges to access Level 200, Mezzanine to view the posters.

Posters that are not set up by the 5:00 pm cut-off time will be considered no-shows, and their manuscripts may not be published. Poster authors should accompany their posters from 6:00 to 7:30 pm to answer questions from attendees. All posters and other materials must be removed no later than 8:00 pm. Any posters or materials left behind at the close of the poster session will be considered unwanted and will be discarded. SPIE assumes no responsibility for posters left up after the end of each poster session.

Building GSM network in extreme conditions, Martin Mikulec, Miroslav Voznak, Marcel Fajkus, Pavol Partila, Jiri Slachta, Zdenka Chmelikova, VŠB-Technical Univ. of Ostrava (Czech Republic) . . . . [9478-19]

CONFERENCE 9479

Tuesday–Thursday 21–23 April 2015 • Proceedings of SPIE Vol. 9479

Open Architecture/Open Business Model Net Centric Systems and Defense Transformation 2015

Conference Chair: **Raja Suresh,** General Dynamics Advanced Information Systems (USA)

Program Committee: **Robert Bond,** MIT Lincoln Lab. (USA); **Vasu D. Chakravarthy,** Air Force Research Lab. (USA); **Megan Cramer,** U.S. Navy PEO LCS (USA); **John S. Eicke,** U.S. Army Research Lab. (USA); **Thomas Green,** SAIC (USA); **Nickolas Guertin,** U.S. Navy (USA); **Michael A. Kolodny,** U.S. Army Research Lab. (USA); **Leo J. Rose,** U.S. Air Force (USA); **Jason R. Stack,** Office of Naval Research (USA)

Tuesday 21 April

SESSION 1. . . . . TUE 8:30 AM TO 11:40 AM

Affordability Considerations in Military Systems

Session Chair: **Roy H. Olsson III,** DARPA (USA)

Reconfigurable technologies and architectures for phased array antennas: an overview of the DARPA ACT program *(Invited Paper)*, Roy H. Olsson III, Defense Advanced Research Projects Agency (USA). . . . . [9479-1]

Methodologies to analyze and explore the impact of technological and operational changes on the fully burdened cost structure of the global force structure *(Invited Paper)*, Mitchell W. Kossar, Benjamin Rogers, First Principles Advisory Group (USA). . . . . [9479-2]

GTRI software defined modular array antenna, Richard T. Lee, Ryan S. Westafer, Georgia Tech Research Institute (USA) . . . . [9479-3]

Optically-controlled GeTe phase change switch and its applications in reconfigurable antenna arrays, Loc Chau, James Ho, Xing Lan, Northrop Grumman Aerospace Systems (USA); Robert M. Young, Doyle Nichols, Nabil El-Hinnawy, Northrop Grumman Electronic Systems (USA); Nima Ghalichechian, John Volakis, The Ohio State Univ. (USA). . . . . [9479-4]

Impact - a low cost, reconfigurable, digital beamforming common module building block for next generation phased arrays, Lee Paulsen, Ted Hoffmann, Charlie Nguyen, Rockwell Collins, Inc. (USA) . . . . [9479-5]

Higher-order N-path filters and active cancellation techniques for interference mitigation and STAR in digital array receivers, Harish Krishnaswamy, Jin Zhou, Negar Reiskarimian, Columbia Univ. (USA) . . . [9479-6]

Vanadium dioxide phase change switches, Mark Field, Christopher Hillman, Philip Stupar, Jonathan Hacker, Zachary Griffith, Teledyne Scientific Co. (USA); Kang-Jin Lee, Teledyne Scientific & Imaging, LLC (USA) . . . . [9479-7]

Lunch/Exhibition Break . . . . 11:40 am to 1:00 pm

SESSION 2 . . . . TUE 1:00 PM TO 3:10 PM

Open Architecture Systems

Session Chairs: **Jason R. Stack,** Office of Naval Research (USA); **Megan A. Cramer,** U.S. Navy (USA)

DOD product lines: a holistic strategy for defense open business models *(Invited Paper)*, Robert Matthews, Naval Air Systems Command (USA). . [9479-8]

A systems approach to achieving the benefits of open and modular systems, Gavin Pearson, Defence Science and Technology Lab. (United Kingdom); Richard Smith, IBM United Kingdom Ltd. (United Kingdom); Howard Tripp, Chemring EOD Ltd. (United Kingdom) . . . . [9479-9]

Q-learning and p-persistent CSMA based MAC protocol for cognitive radio networks operating with shared spectrum activity, Clifton L. Watson, Air Force Research Lab. (USA); Subir Biswas, Michigan State Univ. (USA). [9479-10]

Open architecture design and approach for the integrated sensor architecture (ISA), Christine L. Moulton, U.S. Army Night Vision & Electronic Sensors Directorate (USA); Jared J. Hepp, John Harrell, Oakwood Controls (USA); Michael Kogut, SAIC (USA) . . . . [9479-11]

Architecting open AUV systems, Dani Goldberg, Bluefin Robotics Corp. (USA) . . . . [9479-12]

Modular open RF architecture: extending VICTORY to RF systems, Jason Dirner, Vistronix (USA). . . . . [9479-13]

Wednesday 22 April

SESSION 4 . . . . WED 8:30 AM TO 10:30 AM

Self-organizing Collaborative Unmanned ISR Teams I

Joint Session with Conferences 9479 and 9468

Session Chairs: **Raja Suresh,** General Dynamics Advanced Information Systems (USA); **Robert E. Karlsen,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA)

DARPA perspective on open architectures *(Invited Paper)*, John Shaw, Defense Advanced Research Projects Agency (USA). . . . . [9479-14]

Open mission system overview *(Invited Paper)*, Eric Koper, U.S. Air Force (USA) . . . . [9479-15]

Overview of DARPA CODE program *(Invited Paper)*, Jean-Charles Lede, Defense Advanced Research Projects Agency (USA). . . . . [9479-16]

Open architecture flexible weapons *(Invited Paper)*, Jonathan Shaver, Air Force Research Lab. (USA) . . . . [9479-17]

DEDICATED EXHIBITION TIME AND LUNCH BREAK . . . . 10:30 AM TO 1:00 PM

Enjoy Wednesday morning coffee break with a complimentary continental breakfast while walking the exhibition floor and connecting with reps from the largest prime contractors, key suppliers, and dynamic startups. Meet with vendors showcasing their newest products and cutting-edge technologies in optics, photonics, sensing, and imaging. Various food outlets are also located in the DSS Expo Hall and will be open for lunch during Exhibition Hours.

SESSION 5 . . . . WED 1:00 PM TO 3:10 PM

Self-organizing, Collaborative Unmanned ISR Teams II

Joint Session with conferences 9479 and 9468

Session Chairs: **Raja Suresh,** General Dynamics Advanced Information Systems (USA); **Robert E. Karlsen,** U.S. Army Tank Automotive Research, Development and Engineering Ctr. (USA)

Executable architecture management system *(Invited Paper)*, Jeff Monroe, Metron, Inc. (USA) . . . . [9479-18]

UAV field demonstration of social media enabled tactical data link, Christopher C. Olson, Andrew J. Newman, Da Xu, Sean R. Martin, Jonathan C. Castelli, Johns Hopkins Univ. Applied Physics Lab., LLC (USA) . . . . . . [9468-12]

Fuel Cell powered small unmanned aerial systems (UASs) for extended endurance, Deryn D. Chu, Zachary Dunbar, Rongzhong Jiang, U.S. Army Research Lab. (USA) . . . . [9468-13]

Tactical 3D model generation using structure-from-motion on video from unmanned systems, Joshua D. Harguess, Mark Bilinski, Kim B. Nguyen, Darren N. Powell, Susie Alderson, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-14]

Aircraft path planning for optimal imaging using dynamic cost functions, Gordon Christie, Haseeb R. Chaudhry, Kevin Kochersberger, Virginia Polytechnic Institute and State Univ. (USA) . . . . [9468-15]

UxV to the cloud via widgets, Michael August, Darren N. Powell, Charles Yetman, Kim B. Nguyen, Joshua D. Harguess, Mark Bilinski, Space and Naval Warfare Systems Ctr. Pacific (USA) . . . . [9468-16]

DEFENSE + SECURITY

CONFERENCE 9479

Thursday 23 April

SESSION 6 . . . . THU 8:30 AM TO 10:10 AM

MAST: Bio-inspired Control

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Hummingbird flight control under extreme aerodynamic circumstances *(Invited Paper)*, Robert Dudley, Univ. of California, Berkeley (USA) . . . . [9467-58]

A control theoretic approach to neuromorphic computing *(Invited Paper)*, Michael Dorothy, Univ. of Illinois at Urbana-Champaign (USA) . . . . [9467-59]

Bio-inspired sensing and control for disturbance rejection and stabilization *(Invited Paper)*, Gregory Gremillion, James S. Humbert, Univ. of Maryland, College Park (USA) . . . . [9467-60]

High-speed autonomous navigation of unknown environments using learned probabilities of collision *(Invited Paper)*, Charles Richter, Nicholas Roy, Massachusetts Institute of Technology (USA) . . . . [9467-61]

Detecting discrete phenomena using wide field integration methods *(Invited Paper)*, Allison M. Mathis, Joseph K. Conroy, William D. Nothwang, Ryan Robinson, Jared Shamwell, U.S. Army Research Lab. (USA). . . . . [9467-62]

SESSION 7 . . . . THU 10:40 AM TO 12:00 PM

MAST: Scale Legged Locomotion

Joint Session with Conferences 9467, 9468, 9479

Session Chairs: **Christopher M. Kroninger,** U.S. Army Research Lab. (USA); **William D. Nothwang,** U.S. Army Research Lab. (USA)

Dynamic legged locomotion for palm-size robots *(Invited Paper)*, Ronald Fearing, Duncan Haldane, Univ. of California, Berkeley (USA); David Zarrouk, Ben-Gurion Univ. of the Negev (Israel) . . . . [9467-63]

Metastable legged locomotion in real-world environments: methods to quantify and optimize reliability *(Invited Paper)*, Katie Byl, Cenk O. Saglam, Univ. of California, Santa Barbara (USA). . . . . [9467-64]

Scattering of a legged robot in a heterogeneous granular terrain *(Invited Paper)*, Feifei Qian, Daniel I. Goldman, Georgia Institute of Technology (USA) . . . . [9467-65]

Data driven models of legged locomotion *(Invited Paper)*, Shai Revzen, Univ. of Michigan (USA) . . . . [9467-66]

Lunch/Exhibition Break . . . . 12:00 pm to 1:00 pm

SESSION 8 . . . . THU 1:00 PM TO 3:00 PM

ISR Systems

Session Chair: **Raja Suresh,** General Dynamics Advanced Information Systems (USA)

Challenges in RF convergence *(Invited Paper)*, Vincent Sabio, Defense Advanced Research Projects Agency (USA). . . . . [9479-19]

Development of a video SAR for FMV through clouds *(Invited Paper)*, H. Bruce Wallace, Defense Advanced Research Projects Agency (USA) . . . . [9479-20]

Embedded cooling for defense electronics *(Invited Paper)*, Avram Bar-Cohen, Defense Advanced Research Projects Agency (USA). . . . . [9479-21]

A common open systems architecture for ISR sensor payloads *(Invited Paper)*, Gibbs Dickson, U.S. Air Force (USA) . . . . [9479-22]

SPIE COURSES & WORKSHOPS

SPIE STUDENT MEMBERS GET 50% OFF COURSES—
SEE DETAILS ONLINE

Take advantage of face-to-face instruction from some of the biggest names in industry and research.

Sign up for training and professional development courses to stay competitive and advance your career. Learn current approaches in lasers and applications, sensors, imaging, IR systems, optical & optomechanical engineering, and more. With 35 half- and full-day courses and workshops offered, you can find those that meet your specific needs and earn CEUs to fulfill ongoing professional education requirements.

SEE DETAILED DESCRIPTIONS AND REGISTER FOR COURSES ONLINE.

NEW AND FEATURED COURSES:

- Design of Multiband Optical Systems
- Fundamentals of Fiber Optic Sensor Design and Technology
- Dimensionality Reduction for Hyperspectral Image Analysis
- Laser Systems Engineering
- Applications and Performance of High Power Lasers in the Battlefield
- Radiometry and its Practical Applications
- Statistics for Imaging and Sensor Data

COURSES ON INFRARED TECHNOLOGY AND APPLICATIONS

Courses on infrared-related topics have been reviewed and expanded for 2015. The updates incorporate the latest advancements in materials and engineering approaches and increase the value and applicability of the training to your daily work.

Please refer to the IR Sensors & Systems track online for full course descriptions.

MONEY-BACK GUARANTEE

We are confident that once you experience an SPIE course for yourself you will look to us for your future education needs. However, if for any reason you are dissatisfied, we will gladly refund your money. We just ask that you tell us what you did not like; suggestions for improvement are always welcome.

CONTINUING EDUCATION UNITS

SPIE has been approved as an authorized provider of CEUs by IACET, The International Association for Continuing Education and Training (Provider #1002091). In obtaining this approval, SPIE has demonstrated that it complies with the ANSI/IACET Standards which are widely recognized as standards of good practice.

SPIE reserves the right to cancel a course due to insufficient advance registration.

IR SENSORS AND SYSTEMS

OPTICAL AND OPTOMECHANICAL ENGINEERING

DEFENSE, HOMELAND SECURITY, AND LAW ENFORCEMENT

DISPLAYS

COURSE INDEX

EMERGING TECHNOLOGIES

IMAGERY AND PATTERN ANALYSIS

IMAGING AND SENSING TECHNOLOGIES

INFORMATION SYSTEMS AND NETWORKS: PROCESSING, FUSION, AND KNOWLEDGE GENERATION

INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE

THIS PROGRAM IS CURRENT AS OF DECEMBER 2014

COURSE INDEX

DAILY COURSE SCHEDULE

IR Sensors and Systems

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
SC713 **Engineering Approach to Imaging System Design** (Holst) 8:30 am to 5:30 pm, $565 / $660	SC1162 **Design of Multiband Optical Systems** (Unger) 8:30 am to 5:30 pm, $565 / $660	SC1112 **Introduction to Electro-Optical Systems Design** (Stotts) 8:30 am to 5:30 pm, $580 / $675	SC789 **Introduction to Optical and Infrared Sensor Systems** (Shaw) 8:30 am to 5:30 pm, $515 / $610	SC972 **Basic Laser Technology** (Sukuta) 8:30 am to 12:30 pm, $295 / $345
SC152 **Infrared Focal Plane Arrays** (Dereniak, Hubbs) 8:30 am to 5:30 pm, $515 / $610	SC1137 **Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation** (Schroeder) 8:30 am to 5:30 pm, $515 / $610	SC181 **Predicting Target Acquisition Performance of Electro-Optical Imagers** (Vollmerhausen) 8:30 am to 5:30 pm, $570 / $665	SC1135 **Multispectral Image Fusion and Night Vision Colorization** (Zheng, Blasch) 8:30 am to 12:30 pm, $295 / $345	SC067 **Testing and Evaluation of E-O Imaging Systems** (Holst) 8:30 am to 5:30 pm, $595 / $690
SC835 **Infrared Systems - Technology & Design** (Daniels) 8:30 am to 5:30 pm, $1,045 / $1,265		SC1161 **Dimensionality Reduction for Hyperspectral Image Analysis** (Du) 1:30 pm to 5:30 pm, $295 / $345	SC1068 **Introduction to Night Vision** (Browne) 1:30 pm to 5:30 pm, $295 / $345	
SC214 **Infrared Window and Dome Materials** (Harris) 8:30 am to 5:30 pm, $585 / $680	SC1136 **Infrared Optical Materials, Fabrication and Testing for the Optical Engineer** (DeGroote Nelson) 1:30 to 5:30 pm, $295 / $345	SC1109 **Infrared Radiometric Calibration** (Yoon, Eppeldauer, Kaplan, Gibson) 1:30 pm to 5:30 pm, $295 / $345	SC154 **Electro-Optical Imaging System Performance** (Holst) 8:30 am to 5:30 pm, $600 / $695	
SC900 **Uncooled Thermal Imaging Detectors and Systems** (Hanson) 8:30 am to 5:30 pm, $555 / $650	SC1073 **Radiometry and its Practical Applications** (Grant) 8:30 am to 5:30 pm, $590 / $685			
	SC194 **Multispectral and Hyperspectral Image Sensors** (Lomheim) 8:30 am to 12:30 pm, $375 / $425			

Optical and Optomechanical Engineering

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
SC713 **Engineering Approach to Imaging System Design** (Holst) 8:30 am to 5:30 pm, $565 / $660	SC1162 **Design of Multiband Optical Systems** (Unger) 8:30 am to 5:30 pm, $565 / $660	SC609 **Basic Optics for Non-Optics Personnel** (Harding) 8:30 am to 11:00 am, $100 / $150		
	SC1073 **Radiometry and its Practical Applications** (Grant) 8:30 am to 5:30 pm, $590 / $685	SC1112 **Introduction to Electro-Optical Systems Design** (Stotts) 8:30 am to 5:30 pm, $580 / $675		
	SC1136 **Infrared Optical Materials, Fabrication and Testing for the Optical Engineer** (DeGroote Nelson) 1:30 to 5:30 pm, $295 / $345	SC1109 **Infrared Radiometric Calibration** (Yoon, Eppeldauer, Kaplan, Gibson) 1:30 pm to 5:30 pm, $295 / $345		
	SC1052 **Optical Systems Engineering** (Kasunic) 8:30 am to 5:30 pm, $595 / $690	SC014 **Introduction to Optomechanical Design** (Vukobratovich) 8:30 am to 5:30 pm, $890 / $1,110		
	SC015 **Structural Adhesives for Optical Bonding** (Daly) 1:30 pm to 5:30 pm, $295 / $345			
	SC010 **Introduction to Optical Alignment Techniques** (Castle) 8:30 am to 5:30 pm, $515 / $610			

DAILY COURSE SCHEDULE

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
Defense, Homeland Security, and Law Enforcement				
SC1104 **Applications and Performance of High Power Lasers in the Battlefield** (Kalisky) 1:30 pm to 5:30 pm, $295 / $345	SC1073 **Radiometry and its Practical Applications** (Grant) 8:30 am to 5:30 pm, $590 / $685	SC1161 **Dimensionality Reduction for Hyperspectral Image Analysis** (Du) 1:30 pm to 5:30 pm, $295 / $345	SC789 **Introduction to Optical and Infrared Sensor Systems** (Shaw) 8:30 am to 5:30 pm, $515 / $610	SC067 **Testing and Evaluation of E-O Imaging Systems** (Holst) 8:30 am to 5:30 pm, $595 / $690
	SC1162 **Design of Multiband Optical Systems** (Unger) 8:30 am to 5:30 pm, $565 / $660	SC1112 **Introduction to Electro-Optical Systems Design** (Stotts) 8:30 am to 5:30 pm, $580 / $675	SC1135 **Multispectral Image Fusion and Night Vision Colorization** (Zheng, Blasch) 8:30 am to 12:30 pm, $295 / $345	SC972 **Basic Laser Technology** (Sukuta) 8:30 am to 12:30 pm, $295 / $345
	SC1137 **Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation** (Schroeder) 8:30 am to 5:30 pm, $515 / $610	SC181 **Predicting Target Acquisition Performance of Electro-Optical Imagers** (Vollmerhausen) 8:30 am to 5:30 pm, $570 / $665	SC995 **Target Detection Algorithms for Hyperspectral Imagery** (Nasrabadi) 8:30 am to 5:30 pm, $515 / $610	
			SC154 **Electro-Optical Imaging System Performance** (Holst) 8:30 am to 5:30 pm, $600 / $695	
			SC1068 **Introduction to Night Vision** (Browne) 1:30 pm to 5:30 pm, $295 / $345	
Displays				
SC066 **Fundamentals of Electronic Image Processing** (Weeks) 8:30 am to 5:30 pm, $585 / $680	SC159 **Head-Mounted Displays: Design and Applications** (Melzer, Browne) 8:30 am to 5:30 pm, $515 / $610		SC1135 **Multispectral Image Fusion and Night Vision Colorization** (Zheng, Blasch) 8:30 am to 12:30 pm, $295 / $345	
			SC1068 **Introduction to Night Vision** (Browne) 1:30 pm to 5:30 pm, $295 / $345	
Emerging Technologies				
		SC1076 **Analog-to-Digital Converters for Digital ROICs** (Veeder) 8:30 am to 5:30 pm, $515 / $610		

THIS PROGRAM IS CURRENT AS OF DECEMBER 2014

DAILY COURSE SCHEDULE

Imagery and Pattern Analysis

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
SC160 **Precision Stabilized Pointing and Tracking Systems** (Hilkert) 8:30 am to 5:30 pm, $515 / $610		SC1161 **Dimensionality Reduction for** Hyperspectral Image Analysis (Du) 1:30 pm to 5:30 pm, $295 / $345		

Imaging and Sensing Technologies

MONDAY	TUESDAY	WEDNESDAY	THURSDAY	FRIDAY
SC713 **Engineering Approach to Imaging System Design** (Holst) 8:30 am to 5:30 pm, $565 / $660	SC1137 **Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation** (Schroeder) 8:30 am to 5:30 pm, $515 / $610	SC1161 **Dimensionality Reduction for Hyperspectral Image Analysis** (Du) 1:30 pm to 5:30 pm, $295 / $345	SC789 **Introduction to Optical and Infrared Sensor Systems** (Shaw) 8:30 am to 5:30 pm, $515 / $610	SC067 **Testing and Evaluation of E-O Imaging Systems** (Holst) 8:30 am to 5:30 pm, $595 / $690
SC066 **Fundamentals of Electronic Image Processing** (Weeks) 8:30 am to 5:30 pm, $585 / $680	SC1160 **Fundamentals of Fiber Optic Sensor Design and Technology** (Udd, Lieberman) 8:30 am to 5:30 pm, $545 / $640	SC1112 **Introduction to Electro-Optical Systems Design** (Stotts) 8:30 am to 5:30 pm, $580 / $675	SC995 **Target Detection Algorithms for Hyperspectral Imagery** (Nasrabadi) 8:30 am to 5:30 pm, $515 / $610	
SC152 **Infrared Focal Plane Arrays** (Dereniak, Hubbs) 8:30 am to 5:30 pm, $515 / $610	SC194 **Multispectral and Hyperspectral Image Sensors** (Lomheim) 8:30 am to 12:30 pm, $375 / $425	SC1109 **Infrared Radiometric Calibration** (Yoon, Eppeldauer, Kaplan, Gibson) 1:30 pm to 5:30 pm, $295 / $345	SC154 **Electro-Optical Imaging System Performance** (Holst) 8:30 am to 5:30 pm, $600 / $695

IR Sensors and Systems

Design of Multiband Optical Systems

New

SC1162

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Multispectral and hyperspectral systems are designed to increase target acquisition performance as well as answer SWaP-C (size/weight/power/cost) requirements for defense and remote sensing systems. Recent developments in optical materials enable optical systems that operate over multiple infrared bands simultaneously. This course describes techniques for designing these systems using existing and new chalcoginide materials, and it provides methods for choosing material combinations, laying out systems, and predicting performance. An emphasis is placed on understanding dispersion and thermal characteristics in order to design achromatic and athermalized dual- and multi-band infrared imaging systems. Additionally, this course will touch upon recent advances in fused, layered, and gradient index infrared optics, specifically with regard to chalcoginide materials.

LEARNING OUTCOMES

This course will enable you to:
- lay out lenses using first order optical design methods
- determine a working set of optical materials based on optical and thermal characteristics
- construct glass maps for dual-band solutions
- optimize glass types using private catalog materials and optimize systems by employing user-defined merit function constraints
- describe axial and radial gradient index infrared materials and explain the advantages/disadvantages of each type

INTENDED AUDIENCE

This course is intended for optical designers and engineers wishing to expand their knowledge of infrared and multiband optics, materials, and design principles. A working understanding of optical design methods and experience with optical design software is recommended.

INSTRUCTOR

Blair Unger is Senior Optical Designer at ASE Optics. He has authored and co-authored papers and patents covering a variety of topics ranging from design of infrared chalcoginide systems to novel solar concentrators. He earned a Ph.D. in Optics at the University of Rochester, Institute of Optics. Dr. Unger is a member of both OSA and SPIE.

COURSE PRICE INCLUDES the text *Optical Design Fundamentals for Infrared Systems, Second Edition* (SPIE, 2001) by Max Riedl.

Infrared Focal Plane Arrays

Updated in 2015

SC152

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Monday 8:30 am to 5:30 pm

The course presents a fundamental understanding of two-dimensional arrays applied to detecting the infrared spectrum. The physics and electronics associated with 2-D infrared detection are stressed with special emphasis on the hybrid architecture unique to two-dimensional infrared arrays.

LEARNING OUTCOMES

This course will enable you to:
- develop the building blocks of 2-D arrays
- explain charge transfer concepts of various architectures
- describe various input electronics circuits
- discuss testing techniques used in the IR for 2-D arrays
- provide an overview of current technologies
- demonstrate aliasing effects
- describe digital FPAs
- review room-temperature thermal arrays
- review uncooled photon arrays
- discuss dual band arrays
- discuss small pixel pitch devices
- review HOT devices
- compare II-VI vs. III-V devices

INTENDED AUDIENCE

This material is intended for engineers, scientists and project managers who need to learn more about two-dimensional IR arrays from a user's point of view. It gives the student insight into the optical detection process, as well as what is available to application engineers, advantages, characteristics and performance.

INSTRUCTOR

Eustace Dereniak is a Professor of Optical Sciences and Electrical and Computer Engineering at the University of Arizona, Tucson, AZ. His research interests are in the areas of detectors for optical radiation, imaging spectrometers and imaging polarimeters instrument development. Dereniak is a co-author of several textbooks and has authored book chapters. His publications also include over 100 authored or co-authored refereed articles. He spent many years in industrial research with Raytheon, Rockwell International, and Ball Brothers Research Corporation. He has taught extensively and is a Fellow of the SPIE and OSA, and a member of the Board of Directors of SPIE.

John Hubbs is an engineer at the Infrared Radiation Effects Laboratory (IRREL). Dr. Hubbs has over 30 years of experience characterizing focal plane arrays (FPAs) in both clear and radiation environments. His research interests are in the areas of detectors for optical radiation and radiation effects on infrared focal plane arrays, which has resulted in the publication of over 75 papers. He is a Fellow of the SPIE and the Military Sensing Symposium (MSS).

Radiometry and its Practical Applications

Updated in 2015

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:
- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Ms. Grant has taught radiometry and allied subjects for SPIE and other educational, governmental, and corporate organizations since 2009. Her consultancy, Lines and Lights Technology, has been in business since 1994 and she has addressed radiometric and systems problems throughout the spectrum from UV to IR.

COURSE PRICE INCLUDES the texts *The Art of Radiometry* (SPIE Press, 2009) by James M. Palmer and Barbara G. Grant, and the *Field Guide to Radiometry* (SPIE Press, 2011) by Barbara G. Grant .

Analog-to-Digital Converters for Digital ROICs

Updated in 2015

SC1076

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course surveys structure and operation of analog-to-digital converters (ADCs) implemented on digital readout integrated circuits (ROICs) and digital image sensors. Attendees will learn how to evaluate ADC architectures using basic figures of merit for use in different sensor formats. We will cover a wide range of cutting edge architectures and see published examples without delving into transistor level theory. We will survey both academia and industrial ADC architectures. From this survey attendees will discover the industrial design evolution convergence down to a few workhorse architectures and what lessons it imparts to the image sensor community. If you are interested in the digital ROIC revolution or if you ever interface with designers or evaluate digital ROIC proposals, then you will benefit from taking this course.

LEARNING OUTCOMES

This course will enable you to:

- identify analog-to-digital architectures used for creating digital ROICs and image sensors
- calculate ADC architecture figures of merit important to image sensors
- evaluate ADC architecture compatibility with image sensor format and requirements
- infer the direction in which state-of-the-art digital image sensors are headed
- name the top ADC architectures used by commercial industry and explain how this knowledge benefits the image sensor industry
- stimulate your own creativity and help you develop new ideas and applications for digital ROICs and digital image sensors

INTENDED AUDIENCE

This course is intended for engineers and physicists with a background in basic electrical theory (electrical stimuli, resistors, capacitors and block diagramming) who wish to learn about analog-to-digital converter architectures and how they are applied to digital ROICs and digital image sensors. An undergraduate degree in science or engineering is assumed, and basic knowledge of electrical engineering will be particularly helpful.

INSTRUCTOR

Kenton Veeder is a ROIC design engineer, systems engineer, and part time detector physicist. He has been in the defense and commercial image sensor field for over 12 years and is the president of Senseeker Engineering Inc. in Santa Barbara, California. He has nine patents and several publications, one of which earned the MSS Detectors best paper award in 2006. While working for Raytheon he was awarded recognition as Raytheon's 'Father of the Digital Focal Plane Array' and he and his team were given the company wide 'Excellence In Technology' award. Kenton earned his M.S. in electrical engineering from the Analog-and-Mixed Signal Center at Texas A&M University. Kenton is a member of SPIE and IEEE.

Infrared Window and Dome Materials

Updated in 2015

SC214

Course Level: Advanced
CEU: 0.65 $585 Members | $680 Non-Members USD
Monday 8:30 am to 5:30 pm

This course presents an overview of the optical, thermal and mechanical characteristics of infrared-transmitting window and dome materials. Other topics include thermal shock response, rain and particle erosion, protective coatings, antireflection coatings, electromagnetic shielding, proof testing, and fabrication of optical ceramics. The course concludes with a brief discussion of sapphire and diamond as infrared materials.

LEARNING OUTCOMES

This course will enable you to:

- identify the optical, thermal and mechanical characteristics of a window material that are critical to its selection for a particular application
- predict optical, thermal and mechanical performance of window materials under a range of conditions, based on tabulated data
- compare the strengths and weaknesses of different materials and different coatings for a given application
- describe the principal methods by which optical ceramics are manufactured

INTENDED AUDIENCE

The course is directed at engineers, scientists, managers and marketing personnel who need an introduction to properties, performance, and manufacture of windows and domes. A basic degree in engineering or science is the expected background, but care will be taken to provide introductory background information for each topic.

INSTRUCTOR

Daniel Harris is a Senior Scientist at the Naval Air Warfare Center, China Lake, California, where he directs programs in optical materials.

COURSE PRICE INCLUDES the text *Materials for Infrared Windows and Domes* (SPIE Press, 1999) by Daniel Harris.<br<<br<Attendees should bring a calculator to this course.

Introduction to Optical and Infrared Sensor Systems

SC789

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to optical (near UV-visible) and infrared sensor systems, with an emphasis on systems used in defense and security. Topics include both passive imagers and active laser radars (lidar/ladar). We begin with a discussion of radiometry and radiometric calculations to determine how much optical power is captured by a sensor system. We survey atmospheric propagation and phenomenology (absorption, emission, scattering, and turbulence) and explore how these issues affect sensor systems. Finally, we perform signal calculations that consider the source, the atmosphere, and the optical system and detector, to arrive at a signal-to-noise ratio for typical passive and active sensor systems. These principles of optical radiometry, atmospheric propagation, and optical detection are combined in examples of real sensors studied at the block-diagram level. Sensor system examples include passive infrared imagers, polarization imagers, and hyperspectral imaging spectrometers, and active laser radars (lidars or ladars) for sensing distributed or hard targets. The course organization is approximately one third on the radiometric analysis of sensor systems, one third on atmospheric phenomenology and detector parameters, and one third on example calculations and examination of sensor systems at the block-diagram level.

LEARNING OUTCOMES

This course will enable you to:

- explain and use radiometry for describing and calculating the flow of optical energy in an optical or infrared sensor system
- determine the radiometric throughput of sensor systems
- describe atmospheric phenomenology relevant to propagation of optical and infrared radiation
- explain how the atmosphere affects the performance of sensor systems
- use detector parameters with radiometric calculations to predict the signal received by passive and active sensors
- calculate signal-to-noise ratio for typical sensor systems
- explain real-world sensor systems at the block-diagram level
- explain the difference between and important concepts of passive reflection-based and emission-based imaging
- describe the basic operating principles of passive imagers and active laser radar (lidar/ladar) systems for distributed and solid target sensing

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who find themselves working on (or curious about) optical (uv-vis) and infrared sensor systems without formal training in this area. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Joseph Shaw has been developing optical remote sensing systems and using them in environmental and military sensing for two decades, first at NOAA and currently as professor of electrical engineering and physics at Montana State University. Recognition for his work in this field includes NOAA research awards, a Presidential Early Career Award for Scientists and Engineers, and the World Meteorological Organization's Vaisala Prize. He earned a Ph.D. in Optical Sciences at the University of Arizona. Dr. Shaw is a Fellow of both the OSA and SPIE.

Infrared Systems - Technology & Design

SC835

Course Level: Advanced
CEU: 1.3 $1,045 Members | $1,265 Non-Members USD
Monday - Tuesday 8:30 am to 5:30 pm

This course covers the range of topics necessary to understand the theoretical principles of modern infrared-technology. It combines numerous engineering disciplines necessary for the development of infrared systems. Practical engineering calculations are highlighted, with examples of trade studies illustrating the interrelationships among the various hardware characteristics.

This course is comprised of four sections:

Section 1 introduces the geometrical optics concepts including image formation, stops and pupils, thick lenses and lens combinations, image quality, and the properties of infrared materials.

Section 2 covers the essentials of radiometry necessary for the quantitative understanding of infrared signatures and flux transfer. These concepts are then developed and applied to flux-transfer calculations for blackbody, graybody, and selective radiator sources. Remote temperature calibrations and measurements are then used as an illustration of these radiometric principles.

Section 3 is devoted to fundamental background issues for optical detection-processes. It compares the characteristics of cooled and uncooled detectors with an emphasis on spectral and blackbody responsivity, detectivity (D*), as well as the noise mechanisms related to optical detection. The detector parameters and capabilities of single detectors and third generation focal plane arrays (FPAs) are analyzed.

With this acquired background, Section 4 considers the systems-design aspects of infrared imagers. The impact of scan format on signal-to-noise ratio is described, and the engineering tradeoffs inherent in the development of infrared search and track (IRST) systems are explained. Figures of merit such as MTF, NETD, and MRTD of staring arrays are examined for the performance metrics of thermal sensitivity and spatial resolution of thermal imaging systems (TIS). Contrast threshold functions based on Johnson and visible cycles (often denoted as N- and V-cycles) are specified. The interrelationships among the design parameters are identified through trade-study examples.

LEARNING OUTCOMES

This course will enable you to:

- learn the principles and fundamentals of infrared optical design
- choose the proper infrared materials suite for your applications
- quickly execute flux-transfer calculations
- calibrate infrared sources and target signatures
- recognize the importance of background in thermal signatures
- have an appreciation for the capacity of infrared systems and learn the interaction of its critical components (optics, detectors, and electronics) in the production of a final infrared image
- assess the influence of noise mechanisms related to optical detection
- comprehend the fundamental response mechanisms and differences between cooled and uncooled single detectors as well as focal plane arrays (FPAs)
- comprehend the central theory behind third generation infrared imagers
- define and use common descriptors for detector and system performance (R, D*, NEP, NEI, MTF, NETD, and MRTD)
- estimate system performance given subsystem and component specifications
- apply design tradeoffs in both infrared search and track systems (IRST) and thermal-imaging systems (TIS)
- carry out the preliminary design of infrared systems for different thermal applications

INTENDED AUDIENCE

This course is directed to the practicing engineers and/or scientists who require both theoretical and effective practical technical information to design, build, and/or test infrared systems in a wide variety of thermal applications. A background at the bachelor's level in engineering is highly recommended. The participant should also have ample understanding of Fourier analysis and random processes.

INSTRUCTOR

Arnold Daniels is a senior lead engineer with extensive experience in the conceptual definition of advance infrared, optical, and electro-optical systems. His background consists of technical contributions to applications for infrared search & track, thermal imaging, and ISR systems. Other technical expertise include infrared radiometry (testing and measurements), infrared test systems (i.e., MTF, NETD, and MRTD), thermographic nondestructive testing (TNDT), optical design, precision optical alignment, stray light analysis, adaptive optics, Fourier analysis, image processing, and data acquisition systems. He earned an M.S. in Electrical Engineering from the University of Tel-Aviv and a doctorate in Electro-Optics from the School of Optics (CREOL) at the University of

Central Florida. In 1995 he received the Rudolf Kingslake medal and prize for the most noteworthy original paper to appear in SPIE's Journal of Optical Engineering. He is presently developing direct energy laser weapon systems for defense applications.

COURSE PRICE INCLUDES the *Field Guide to Infrared Systems, Detectors, and FPAs, 2nd Edition* by Arnold Daniels (SPIE, 2010) and *Infrared Detectors and Systems* (Wiley, 1996) by Eustace L. Dereniak and Glenn D. Boreman.

Uncooled Thermal Imaging Detectors and Systems

Updated in 2015

SC900

Course Level: Intermediate
CEU: 0.65 $555 Members | $650 Non-Members USD
Monday 8:30 am to 5:30 pm

The success of uncooled infrared imaging in commercial and military markets has greatly increased the number of participants in the field, and, consequently, the variety of products available and in development. The intent of this course is to provide attendees a broad view of the field as well as an in-depth look at important technologies. The course describes the fundamentals of uncooled IR imaging arrays, emphasizing resistive bolometric and ferroelectric/pyroelectric detectors, but also including a number of innovative technologies such as thermally activated cantilevers, thin films with temperature-dependent optical transmission properties, and thermal-capacitive detectors. Students will learn the fundamentals of uncooled IR sensors, how the various technologies operate, the merits and deficiencies of the different technologies, quantitative metrics for evaluating and comparing performance, and how key factors influence those metrics. The course also explores the limits of performance of uncooled IR imaging, as well as trends to be expected in future products.

LEARNING OUTCOMES

This course will enable you to:

- describe the operation of uncooled IR detectors and basic readout circuits
- evaluate performance in terms of responsivity, noise, noise equivalent temperature difference, minimum resolvable temperature, and response time
- gauge the fundamental limits to their performance, including temperature-fluctuation noise and background fluctuation noise
- compare theory with measured performance of the uncooled arrays
- evaluate practical issues and limitations of current technology
- ascertain the state of development of new IR technologies by asking the right questions
- differentiate well-developed concepts from ill-conceived notional concepts
- identify the uncooled IR technology best suited to your needs
- assess the performance potential of novel IR imaging technologies
- evaluate quantitatively the performance of a wide variety of uncooled IR detectors
- summarize construction details from the technical literature.

INTENDED AUDIENCE

This material is intended for engineers, scientists, and managers who need a background knowledge of uncooled IR technologies, for those who need to be able to evaluate those technologies for usefulness in particular applications, and for those working in the field who wish to deepen their knowledge and understanding. Anyone concerned with current and future directions in thermal imaging or involved in the development of IR detector technology or advanced uncooled IR system concepts will find this course valuable. The course has a significant mathematical content designed to illustrate the origin of the principles involved, but knowledge of the mathematics is not required to understand the concepts and results.

INSTRUCTOR

Charles Hanson has a Ph.D. in theoretical solid-state physics from Georgetown University. After retiring as CTO of L-3 Infrared Products in 2011, he has assumed a position as infrared technologies at Texas Instruments. He has held government and industrial positions in infrared imaging for 45 years. He is a past chairman of Military Sensing Symposia (MSS) Passive Sensors and is presently co-chair of the SPIE Infrared Technology and Applications conference.

COURSE PRICE INCLUDES the text *Uncooled Thermal Imaging Arrays, Systems, and Applications* (SPIE Press, 2001) by Paul Kruse.

Engineering Approach to Imaging System Design

Updated in 2015

SC713

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Monday 8:30 am to 5:30 pm

This course discusses the three popular approaches to electro-optical imaging system design: spatial resolution, sensitivity (signal-to-noise ratio), and modulation transfer function (MTF) analysis. While often evaluated individually, all three must be considered to optimize system design. Usually, the dominant MTFs in machine vision devices are image motion (including random vibration of the sensor), optics (including aberrations), and the detector. For man-in-the-loop operation, the display and the eye are of concern and, in many situations, these limit the overall system performance.

Equally important, but often neglected is sampling; an inherent feature of all electronic imaging systems. Sampling, which creates blocky images are particularly bothersome with periodic targets such as test targets and bar codes. An engineering approach is taken. This course will provide numerous practical design examples (case studies) to illustrate the interplay between subsystem MTFs, resolution, sensitivity, and sampling.

LEARNING OUTCOMES

This course will enable you to:

- use approximations; often called 'rules-of-thumb,' or 'back-of-the-envelope' analysis
- identify the subsystem components that affect resolution and sensitivity
- determine if your system is resolution or sensitivity limited
- equivalently determine if your system is detector-limited or optics-limited
- determine which subsystem limits system performance and why
- understand sampling artifacts (Nyquist frequency limit, aliasing, Moiré patterns, and variations in object edge location and width)
- use MTFs, resolution, sensitivity, and sampling concepts for system optimization
- understand the trade-off between MTF and aliasing

INTENDED AUDIENCE

The course is for managers, system designers, test engineers, machine vision specialists, and camera users who want the best performance from their systems. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference *Infrared Imaging Systems: Design, Analysis, Modeling and Testing* since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and IEEE and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Holst's Practical Guide to Electro-Optical Systems* (JCD Publishing, 2003) by Gerald C. Holst.

Testing and Evaluation of E-O Imaging Systems

Updated in 2015

SC067

Course Level: Advanced
CEU: 0.65 $595 Members | $690 Non-Members USD
Friday 8:30 am to 5:30 pm

This course describes all the quantitative and qualitative metrics that are used to characterize imaging system performance. While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). Data analysis techniques are independent of the sensor selected (i.e., wavelength independent). The difference lies in the input variable name (watts, lumens, or delta-T) and the output variable name (volts, lumens, or observer response). Slightly different test methodologies are used for visible and thermal imaging systems. Performance parameters discussed include resolution, responsivity, aperiodic transfer function, slit response function, random noise, uniformity, fixed pattern noise, modulation transfer function (MTF), contrast transfer function (CTF), minimum resolvable temperature (MRT), and the minimum resolvable contrast (MRC). The eye's spatial and temporal integration allows perception of images whose signal-to-noise ratio (SNR) is less than unity. Since all imaging system spatially sample the scene, sampling artifacts occur in all imagery and therefore affects all measurements. Sampling can significantly affect MRT and MTF tests. Low SNR and sampling effects are interactively demonstrated. This course describes the most common testing techniques. Equally important is identifying those parameters that adversely affect results.

LEARNING OUTCOMES

This course will enable you to:

- write concise test procedures with unambiguous system specifications
- identify all appropriate test parameters
- describe the radiometric relationship between delta-T and spectral radiance
- differentiate between observer variability and system response during MRC and MRT testing
- describe the difference between the CTF and the MTF
- learn about the latest MTF measurement techniques
- discern the difference between poor system performance, peculiarities of the system under test, and measurement errors
- assess how sampling affects test results
- appreciate the benefits and short comings of fully automated testing
- identify parameters that can lead to poor results.
- learn about evolving standardized testing concepts

INTENDED AUDIENCE

The course is for managers, specification writers, and test engineers involved with all phases of imaging system characterization ranging from satisfying customer requirements to ensuring that specifications are unambiguous and testable.

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Testing and Evaluation of Infrared Imaging Systems, Third Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Electro-Optical Imaging System Performance

Updated in 2015

SC154

Course Level: Intermediate
CEU: 0.65 $600 Members | $695 Non-Members USD
Thursday 8:30 am to 5:30 pm

While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). System analysis could be performed in the spatial domain. However, it is far easier to work in the frequency domain using MTFs. Subsystem MTFs are combined for overall system analysis. This is often called image chain modeling. Although the math is sometimes complex, the equations are graphed for easy understanding. With the Sept 2002 models (e.g., NVTherm), the minimum resolvable temperature (MRT) and minimum resolvable contrast (MRC) are coupled with the target signature and atmospheric transmittance to provide range performance predictions (target acquisition modeling). Three ranges are predicted: detection, recognition, and identification (often shorten to DRI). DRI ranges depend upon the subsystem MTFs, noise (primarily random and fixed pattern noise), the display, and the eye's response. The two-dimensional (fictitious) spatial frequency approach, three-dimensional noise model, and target discrimination metrics (Johnson's N50) are applied to performance predictions. The 2007 models (e.g., NVThermIP) employ contrast rather than MRT (MRC) for target acquisition and use V50 as a discrimination metric. Limitations and applications of NVTherm and NVThermIP are discussed with a brief demonstration of the models. Selection and optimization of a specific sensor depends upon a myriad of radiometric, spectral, and spatial parameters (e.g., target signature, atmospheric conditions, optics f-number, field-of-view, and detector responsivity). MTFs and their effect on imagery are interactively demonstrated. Spatial sampling is present in all cameras. Super-resolution reconstruction and microscan minimize sampling artifacts. Several optimization examples are discussed (case study examples).

LEARNING OUTCOMES

This course will enable you to:

- use the correct MTFs for image chain analysis
- describe the radiometric relationship between delta-T and spectral radiance
- compare the differences among scanning, staring, and microscan staring array performance
- recognize the limitations of back-of-the-envelope approximations such as resolution and sensitivity
- identify the subsystem (e.g., motion, optics, detector, electronics, and display) that limits performance
- appreciate limitations of range performance predictions (target acquisition predictions)
- determine if mid-wave (MWIR) or long-wave (LWIR) infrared is appropriate for your application
- appreciate the value of graphs rather than a table of numbers
- be conversant with the myriad of technological terms
- become a smart buyer, analyst, and/or user of imaging systems

INTENDED AUDIENCE

This course is intended for engineers, managers, and buyers who want to understand the wealth of information available from imaging system end-to-end analysis. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Electro-Optical Imaging System Performance, Fifth Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Infrared Radiometric Calibration

SC1109

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

This course describes the radiometric calibration techniques used for SI-traceable measurements of sources, detectors and material properties in the infrared wavelength region. The main goal is to enable understanding of infrared measurements with quantified uncertainties so that full uncertainty budgets can be established for the final quantities. Examples from NIST calibrations of sources, detectors and materials will be described.

The properties and measurements of various different blackbody and lamp sources will be discussed. Detector calibrations using both thermal and quantum detectors with monochromators and Fourier-transform spectrometers will be covered. Also, infrared reflectance measurements using Fourier-transform spectrometers will be explained. Examples of NIST-developed infrared transfer and working standard radiometers in field deployments will be utilized to illustrate the above concepts.

LEARNING OUTCOMES

This course will enable you to:

- choose the optimal sources for the measurement needs from the different sources available in the field
- list the procedures for selecting and calibrating infrared detectors and their associated uncertainties
- describe the uncertainty propagation principles in both source and detector calibrations
- utilize techniques for infrared material reflectance measurements and their uncertainty propagation
- characterize a radiation thermometer according to ASTM standards

INTENDED AUDIENCE

This course is designed for technical staff involved in radiometric calibrations of sources, detectors and radiometers.

INSTRUCTOR

Howard Yoon graduated with a B.S. Physics and Chemistry degree from Swarthmore College and earned his M.S. and Ph.D. Physics degrees from the University of Illinois at Urbana-Champaign. He has worked for Bell Communications Research and Dartmouth College. He currently serves as the US Representative to the Consultative Committee on Thermometry and is a member of the IEC TC65/SC65B/WG5 committee. While at NIST, he has received the Allen V. Astin Award and the DOC Silver Award. Currently at NIST he is a physicist working on several projects related to advancing spectroradiometry for improvements in fundamental and disseminated standards of spectral radiance, spectral irradiance, and radiance temperature.

George Eppeldauer received his M.E. and Ph.D. Electronics Engineering degrees from the Technical University of Budapest. Previously, he has worked at the Research Institute for Technical Physics at the Hungarian Academy of Sciences. He won the Best Paper Award at the NCSLI Conference in 2004, and he chairs the CIE TC2-48 Technical Committee (TC) on Spectral Responsivity Calibrations and the CIE TC2-29 TC on Detector Linearity. He is an electronics engineer with research areas in detector metrology developing transfer and working standard optical radiometers, photometers, and colorimeters and realizing detector responsivity based scales. The standards he has developed have been utilized to improve the two NIST SI units, the candela and kelvin, the illuminance responsivity scale, the tristimulus color scale, the spectral power, irradiance, and radiance responsivity reference-scales, and the spectral irradiance scale. He was one of the three pioneers who developed the SIRCUS reference responsivity-calibration facility.

Simon Kaplan received a B.A. Physics degree from Oberlin College and Ph.D. Physics degree from Cornell University. Prior to joining NIST, he has worked at the University of Maryland, College Park. He is a physicist with research interests in spectrophotometry and radiometry. He has worked on the characterization of optical materials and components in support of UV photolithography and infrared remote sensing applications. Currently he is leading the Low Background Infrared (LBIR) facility for absolute detector-based irradiance and radiance calibrations in support of missile defense as well as climate monitoring technology.

Charles Gibson is a Physicist in the Sensor Science Division at the National Institute of Standards and Technology. He earned his B.A. degree in Physics at Fisk University. His career at NIST began in 1986 where his research has focused on the measurement of ultraviolet, visible, and near infrared radiation sources. He realizes the NIST national scales and provides calibration services for spectral radiance, spectral irradiance, temperature, and heat flux. Mr. Gibson is active in several international committees for optical radiation measurement. He is a member of ASTM E20 Committee on Temperature Measurement and the ASTM E21.08 Subcommittee on Thermal Protection. He is a group-recipient of the 2008 Department of Commerce Silver Medal Award for Scientific/Engineering Achievement for advancing ultraviolet radiation measurement science for applications in materials processing, semiconductor manufacturing, and space sciences. He is also a co-recipient of the 2005 NIST Allen V. Astin Measurement Science Award for major advances in the realization and dissemination of the NIST spectral irradiance scale widely used in climate-change research.

This course has been designed to complement and build upon the content presented in SC1073, Radiometry and its Practical Applications. Attendees will benefit maximally from attending both courses.

Introduction to Electro-Optical Systems Design

SC1112

Course Level: Intermediate
CEU: 0.65 $580 Members | $675 Non-Members USD
Wednesday 8:30 am to 5:30 pm

Using communication theory, this full-day course explains the universal principles underlying a diverse range of electro-optical systems. From visible / infra-red imaging, to free space optical communications and laser remote sensing, the course relates key concepts in science and systems engineering to practical systems issues. To provide realistic understanding of the concepts presented, many real-world examples are included.

This course summarizes laser propagation fundamentals, coherent and incoherent optical system characterization, the effects of optical turbulence and particulate scattering on propagating laser beams, atmospheric and submarine laser communication systems concepts, and laser radar and optical imaging basics. Also included are discussions of adaptive optics, adaptive image processing, statistical hypothesis testing, and their effect on system performance.

LEARNING OUTCOMES

This course will enable you to:

- perform Fourier and Geometric Optics Analyses of electro-optical systems
- estimate detector noise statistics, detector performance, and signal-to-noise ratio
- perform first order image processing, including statistical image enhancements of incoherent images
- calculate contrast, irradiance and radiance created by the propagation of light in particulate environments
- calculate the system link budgets for laser systems, including synthetic aperture ladar

- perform statistical hypothesis testing, which includes how to calculate logarithmic likelihood ratio tests, test statistics, and probabilities of false alarm and detection
- assess and understand real-world Adaptive Optical system performance

INTENDED AUDIENCE

This course is intended for scientists, technical managers and design engineers who are interested in understanding first-order electro-optical system design and the effects that limit system performance.

INSTRUCTOR

Larry Stotts is a consultant and was the Deputy Office Director in the Strategic Technology Office of the Defense Advanced Research Projects Agency. He earned his Ph.D. in Electrical Engineering (Communications Systems) at the University of California at San Diego. He has published over 102 technical reports and journal articles and 2 co-authored books. Recognition of his work includes a Department of Defense Medal for Distinguished Civilian Service; two Secretary of Defense Medal for Meritorious Civilian Service Awards; two DARPA Technical Achievement Awards; The Technical Cooperation Program Technical Achievement Award, and the Naval Ocean Systems Center Technical Director's Award. Dr. Stotts is a Life Fellow of the SPIE, Fellow of the IEEE and a Senior Member and Fellow of OSA.

COURSE PRICE INCLUDES the text *Fundamentals of Electro-Optic Systems Design: Communications, Lidar and Imaging* by S. Karp and L. B. Stotts (Cambridge Press, 2013).

Infrared Optical Materials, Fabrication and Testing for the Optical Engineer

Updated in 2015

SC1136

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Tuesday 1:30 pm to 5:30 pm

This course is designed to give the optical engineer or lens designer an introduction to the technologies and techniques of infrared optical materials, fabrication and testing. This knowledge will help the optical engineer understand which optical specifications/tolerances lead to more cost effective optical components. Topics covered include infrared optical materials, traditional, CNC and novel optical fabrication technologies, surface testing and fabrication tolerances.

LEARNING OUTCOMES

This course will enable you to:

- identify key mechanical, chemical and thermal properties of infrared optical materials (glass, crystals and ceramics) and how they affect the optical system performance and cost of optical components
- review the basics of optical fabrication
- define meaningful surface tolerances
- communicate with optical fabricators
- design optical components that are able to be manufactured and measured using state of the art optical fabrication technologies

INTENDED AUDIENCE

Optical engineers, lens designers, or managers who wish to learn more about how infrared optical materials, fabrication and testing affect the optical designer. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Jessica DeGroote Nelson is the R&D manager and scientist at Optimax Systems, Inc. She specializes in optical materials and fabrication processes. She is an adjunct faculty member at The Institute of Optics at the University of Rochester teaching an undergraduate course on Optical Fabrication and Testing, and has given several guest lectures on optical metrology methods. She earned a Ph.D. in Optics at The Institute of Optics at the University of Rochester. Dr. Nelson is a member of both OSA and SPIE.

Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation

SC1137

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Passive and active sensors are developed for target acquisition and spectroscopic analysis ranging from the ultraviolet through the microwave region. Accurate atmospheric absorption and emission (path radiance) values are essential for sensor development. This data is obtained using MODTRAN, often used in conjunction with NVThermIP, and other sensor software. HITRAN and FASCODE are used for laser applications.

Emphasis will be placed on solving real world problems. Four typical scenarios will be presented: ground-to-ground, ground-to-air, air-to- air and ground-to-space scenarios. The importance of transmission and radiance for each scenario will be discussed.

The students are encouraged to bring their specific scenarios to the course to be setup and run. A computer will be available and we will run these scenarios and discuss the results. The attendees will be able to take home model input files to be used at their facilities. We will discuss their cases along with the expected transmission and atmospheric radiance values.

LEARNING OUTCOMES

This course will enable you to:

- present an overview and explain the "theory" of the models: emphasis on MODTRAN
- apply the models to atmospheric transmission/radiance, smart weapons for defense applications, EO sensors development/evaluations, ground and satellite image correction, hyperspectral imaging, laser spectroscopy laser communications and LIDAR/LADAR systems.
- evaluate a "basic" problem: You are on the ground looking up to an aircraft. Your partner is on the aircraft looking down at the ground. Do you and your partner measure the same atmospheric transmission? Do you and your partner measure the same radiance? Why?
- identify MODTRAN assumptions, capabilities and limitations
- define basic model inputs – i.e. "MODTRAN for Dummies"
- utilize advanced model inputs such as radiosonde data, Lambertian surfaces, BRDF etc.
- solve and run your own specific scenarios
- compare other models and databases: FASCODE, EOSAEL, HITRAN, NVThermIP etc.

INTENDED AUDIENCE

This course is for engineers and scientist involved in sensor design, sensor evaluation, and remote sensing for solving problems ranging from target detection and identification through global warming.

INSTRUCTOR

John Schroeder is the chief scientist of the Ontar Corporation. He has been involved with the development and use of atmospheric and sensor computer models and atmospheric databases for over 40 years. He has numerous publication in scientific journals and conference presentations in related areas.

Multispectral and Hyperspectral Image Sensors

SC194

Course Level: Advanced
CEU: 0.35 $375 Members | $425 Non-Members USD
Tuesday 8:30 am to 12:30 pm

This course will describe the imaging capabilities and applications of the principal types of multispectral (MS) and hyperspectral (HS) sensors. The focus will be on sensors that work in the visible, near-infrared and shortwave-infrared spectral regimes, but the course will touch on longwave-infrared applications. A summary of the salient features of classical color imaging (human observation) will also be provided in an appendix.

LEARNING OUTCOMES

This course will enable you to:

- understand many of the applications and advantages of multispectral (MS) and hyperspectral (HS) imaging
- describe and categorize the properties of the principal MS / HS design types (multi-band scanner, starers with filter wheels, dispersive, wedge, and Fourier transform imagers with 2D arrays, etc.)
- list and define the relevant radiometric radiometric quantities, concepts and phenomenology
- understand the process of translating system requirements into sensor hardware constraints and specifications
- analyze signal-to-noise ratio, modulation-transfer-function, and spatial / spectral sampling for MS and HS sensors
- define, understand and apply the relevant noise-equivalent figures-of-merit (Noise-equivalent reflectance difference, Noise-equivalent temperature difference, Noise-equivalent spectral radiance, Noise-equivalent irradiance, etc.)
- describe the elements of the image chain from photons-in to bits-out (photon detection, video signal manipulation, analog processing, and digitization)
- list and review key imager subsystem technology elements (optical, focal plane, video electronics, and thermal)
- formulate a detailed end-to-end design example of a satellite imaging scanning HS sensor
- provide an appendix that summarizes color imaging principles and sensor associated elements for human observation applications (e.g. color television, still cameras, etc.)

INTENDED AUDIENCE

Engineers, scientists, and technical managers who are interested in understanding and applying multispectral and hyperspectral sensors in advanced military, civil, scientific and commercial applications.

INSTRUCTOR

Terrence Lomheim holds the position of Distinguished Engineer at The Aerospace Corp. He has 34 years of hardware and analysis experience in visible and infrared electro-optical systems, focal plane technology, and applied optics, and has authored and co-authored 63 publications in these technical areas. He is a Fellow of the SPIE.

COURSE PRICE INCLUDES the text *CMOS/CCD Sensors and Camera Systems, 2nd edition* (SPIE Press, 2011) by Terrence Lomheim and Gerald Holst.

Predicting Target Acquisition Performance of Electro-Optical Imagers

SC181

Course Level: Advanced
CEU: 0.65 $570 Members | $665 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course describes how to predict and evaluate electro-optical (EO) imager performance. Metrics that quantify imager resolution are described. The detection, recognition, and identification tasks are discussed, and the meaning of acquisition probabilities is explained. The basic theory of operation of thermal imagers, image intensifiers, and video cameras is presented. This course describes how to quantify the resolution and noise characteristics of an EO imager. The theory and analysis of sampled imagers is emphasized. Image quality metrics are described, and the relationship between image quality and target acquisition performance is explained. The course provides a complete overview of how to analyze and evaluate the performance of EO imagers.

LEARNING OUTCOMES

This course will enable you to:

- describe what a target acquisition model does
- describe the operation of thermal sensors, video cameras and other EO imagers
- analyze the impact of sampling on targeting performance
- evaluate the targeting performance of an EO imager

INTENDED AUDIENCE

This course is intended for the design engineer or system analyst who is interested in quantifying the performance of EO imagers. Some background in linear systems analysis is helpful but not mandatory.

INSTRUCTOR

Richard Vollmerhausen started his engineering career in 1965 at Douglas Aircraft; he worked instrumentation on the S-IVB Stage of the Saturn Apollo. After two years in the army, he moved to the Naval Weapon Center at China Lake and designed infrared trackers for air-to-air missiles. In the early 1980's, he joined the army's Night Vision lab and became head of the branch developing targeting and pilotage systems for army aviation. In the late 1990's, he headed the Model Development Branch at NVL and developed the target acquisition models currently used by the army. After retirement in 2003, he consulted for government and industry. In 2011, he started graduate studies University of Delaware, receiving his PhD in EE in 2013. Dr. Vollmerhausen is currently Chief Engineer and a founding partner of St. Johns Optical Systems in Lake Mary, Florida.

COURSE PRICE INCLUDES the text *Analysis and Evaluation of Sampled Imaging Systems* (SPIE Press, 2010) by Richard H. Vollmerhausen, Ronald G. Driggers, and Don Reago.

Multispectral Image Fusion and Night Vision Colorization

SC1135

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Thursday 8:30 am to 12:30 pm

This course presents methods and applications of multispectral image fusion and night vision colorization organized into three areas (1) image fusion methods, (2) evaluation, and (3) applications. Two primary multiscale fusion approaches, image pyramid and wavelet transform, will be emphasized. Image fusion comparisons include data, metrics, and analytics.

Fusion applications presented include off-focal images, medical images, night vision, and face recognition. Examples will be discussed of night-vision images rendered using channel-based color fusion, lookup-table color mapping, and segment-based method colorization. These images resemble natural color scenes and thus can improve the observer's performance. After taking this course you will know how to combine multiband images and how to render the result with colors in order to enhance computer vision and human vision.

In addition to the course notes, attendees will receive a set of published papers, the data sets used in the analysis, and MATLAB code of methods and metrics for evaluation. A FTP website is established for course resource access.

LEARNING OUTCOMES

This course will enable you to:

- review the applications and techniques of image fusion and night vision enhancement
- categorize multiscale image fusion methods : image pyramid vs. wavelet transform
- apply quantitative vs. qualitative evaluation
- investigate advanced fusion applications: color fusion and face recognition
- obtain an overview of colorization methods: color mapping, segment-based, channel-based
- evaluate colorized images: qualitative vs. quantitative, and links to the NIIRS (National Imagery Interpretability Rating Scale) ratings
- explore information fusion application to a multispectral stereo face recognition system at four levels: image, feature, score, and decision; qualitatively evaluate performance improvement
- recognize and discuss challenges for future development and applications

INTENDED AUDIENCE

Scientists, engineers, practitioners, students, and researchers who wish to learn more about how to combine multiband images to enhance computer vision and human vision as well as face recognition. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Yufeng Zheng received his PhD in optical engineering/image processing from the Tianjin University in Tianjin, China, in 1997. He is currently an associate professor at Alcorn State University in Lorman, Mississippi. He is the principle investigator of three federal research grants in night vision enhancement, and in multispectral face recognition. He holds two patents in glaucoma classification and face recognition, and has published more than 70 peer-reviewed papers. His research interests include pattern recognition, biometrics, information fusion, and computer-aided diagnosis. He is a Cisco Certified Network Professional (CCNP), and a senior member of SPIE, and IEEE Computer Society & Signal Processing.

Erik Blasch received his B.S. in mechanical engineering from the Massachusetts Institute of Technology in 1992 and M.S. degrees in mechanical engineering, health science, and industrial engineering (human factors) from Georgia Tech. He completed an M.B.A., M.S.E.E., M.S. econ, M.S./Ph.D. psychology (ABD), and a Ph.D. in electrical engineering from Wright State University and is a graduate of Air War College. From 2000-2010, Dr. Blasch was the information fusion evaluation tech lead for the Air Force Research Laboratory (AFRL) Sensors Directorate—COMprehensive Performance Assessment of Sensor Exploitation (COMPASE) Center, and adjunct professor with Wright State University. From 2010-2012, Dr. Blasch was an exchange scientist to Defence R&D Canada at Valcartier, Quebec in the Future Command and Control (C2) Concepts group. He is currently with the AFRL Information Directorate supporting information fusion evaluation. He received the 2009 IEEE Russ Bioengineering Award and compiled over 30 top ten finishes as part of robotic teams in international contests. He is a past President of the International Society of Information Fusion (ISIF), a member of the IEEE Aerospace and Electronics Systems Society (AESS) Board of Governors, and a SPIE Fellow. His research interests include target tracking, information/sensor/image fusion, pattern recognition, and biologically-inspired applications.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:

- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Qian (Jenny) Du has been conducting research on hyperspectral image processing and analysis for more than fifteen years. She has numerous peer-reviewed publications in this field, and developed several well-received algorithms. She currently is Bobby Shackouls Professor in the Department of Electrical and Computer Engineering at Mississippi State University. Dr. Du was a selected lecturer for IEEE Geoscience and Remote Sensing Symposium in 2009-2013, and a selected lecturer for the 5th IEEE GRSS Workshop on Hyperspectral Signal and Image Processing: Evolution in Remote Sensing (WHISPERS). She is an Associate Editor for IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing, IEEE Signal Processing Letters, and SPIE Journal of Applied Remote Sensing.

Introduction to Night Vision

SC1068

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Thursday 1:30 pm to 5:30 pm

Night vision devices have become ubiquitous in both commercial and military environments. From the very high end systems used for aviation, to the low-performance systems sold for outdoorsmen, these devices have changed the way their users operate at night. This course explains the basic principles behind night vision and discusses the different types of night vision devices, both "analog" and "digital". In addition to a survey of night vision devices, we also examine the inner workings of night vision systems and explain them in an easy to understand manner. We will discuss the design of night vision systems, both handheld and head mounted.

Although we will talk briefly about SWIR and thermal devices to differentiate them from night vision devices, this course is primarily aimed at visible and near infra-red (NIR) imagers. Imagery from both night vision cameras as well as thermal imagers will be presented and the differences between them will be compared/contrasted.

LEARNING OUTCOMES

This course will enable you to:
- identify the three basic components of a night vision imager: the sensor, the amplifier and the output component
- specify input optics (objective lenses) and output optics (eyepieces) for both analog and digital night vision devices
- explain the difference between VIS/NIR night vision, SWIR, MWIR and LWIR sensors as well as when each should be chosen
- differentiate the different generations of night vision goggles
- define appropriate light levels for night vision device testing
- describe new digital night vision devices and their advantages and disadvantages
- explain the important attributes of night vision systems and how they should be specified for "best value" performance
- predict night vision performance using NVESD models

INTENDED AUDIENCE

Scientists, engineers, technicians, procurement personnel or managers who wish to learn more about night vision devices. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Michael Browne is the Vice President of Product Development at SA Photonics. He has a Ph.D. in Optical Engineering from the University of Arizona's Optical Sciences Center. Mike has been involved in the design, test and measurement of night vision systems since 1986. At Kaiser Electronics, he led the design of numerous head mounted night vision systems including those for the RAH-66 Comanche helicopter and the USAF NVS program. He leads SA Photonics' efforts in the design and development of person-mounted information systems, including body-worn electronics, head-mounted displays and night vision systems. His current research includes investigations into the design of wide field of view night vision devices, binocular rivalry in head mounted displays, and smear reduction in digital displays.

Basic Laser Technology

SC972

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Friday 8:30 am to 12:30 pm

If you are uncomfortable working with lasers as "black boxes" and would like to have a basic understanding of their inner workings, this introductory course will be of benefit to you. The workshop will cover the basic principles common to the operation of any laser/laser system. Next, we will discuss laser components and their functionality. Components covered will include laser pumps/energy sources, mirrors, active media, nonlinear crystals, and Q-switches. The properties of laser beams will be described in terms of some of their common performance specifications such as longitudinal modes and monochromaticity, transverse electromagnetic (TEM) modes and focusability, continuous wave (CW) power, peak power and power stability. Laser slope and wall-plug efficiencies will also be discussed.

LEARNING OUTCOMES

This course will enable you to:
- describe the overall inner workings of any laser
- describe the functionality of the key laser components
- know the difference between how acousto- and electro-optic Q-switches work
- explain how each key component in a laser may contribute to laser performance
- intelligently engage your clients or customers using proper laser terminology
- build stronger relationships with clients and customers by demonstrating product knowledge
- obtain the technical knowledge and confidence to enhance your job performance and rise above the competition, inside and outside your company

INTENDED AUDIENCE

Managers, engineers, technicians, assemblers, sales/marketing, customer service, and other support staff. This short course will help cultivate a common/standardized understanding of lasers across the company.

INSTRUCTOR

Sydney Sukuta is currently a Laser Technology professor at San Jose City College. He also has industry experience working for the some the world's leading laser manufacturers in Silicon Valley where he saw first-hand the issues they encounter on a daily basis. In response, Dr. Sukuta developed prescriptive short courses to help absolve most of these issues.

Optical and Optomechanical Engineering

Introduction to Optical Alignment Techniques

SC010

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course discusses the equipment, techniques, tricks, and skills necessary to align optical systems and devices. You learn to identify errors in an optical system, and how to align lens systems.

LEARNING OUTCOMES

This course will enable you to:
- determine if errors in the optical system are due to misalignment errors or other factors such as fabrication, design, or mounting problems
- recognize and understand the fundamental imaging errors associated with optical systems
- diagnose (qualitatively and quantitively) what is wrong with an optical system by simply observing these fundamental imaging errors

- use the variety of tools available for aligning optical systems, and more importantly, how to "tweak" logically the adjustments on these devices so that the alignment proceeds quickly and efficiently
- align basic lens systems and telescopes
- align more complex optical systems such as those containing off-axis aspheric surfaces, and maintain alignment using automatic mounting techniques

INTENDED AUDIENCE

This course is directed toward engineers and technicians needing basic practical information and techniques to achieve alignment of simple optical systems, as well as seemingly more complicated off-axis aspheric mirrors. To benefit most from this course you will need a basic knowledge of the elementary properties of lenses and optical systems (i.e. focal lengths, f/numbers, magnification, and other imaging properties) and a working knowledge of simple interferometry. Some familiarity with the basic aberrations such as spherical aberration, coma, and astigmatism will be helpful.

INSTRUCTOR

Kenneth Castle Ph.D. is president of Ruda-Cardinal, Inc., an optical engineering consulting firm located in Tucson, Arizona. Ken has worked with Mitch Ruda, the originator of this course, for 28 years. Mitch passed away August 31, 2013, and Ruda-Cardinal is continuing the tradition of this course in his memory.

Introduction to Optomechanical Design

AVAILABLE IN ONLINE FORMAT

SC014

Course Level: Introductory
CEU: 1.3 $890 Members | $1,110 Non-Members USD
Wednesday - Thursday 8:30 am to 5:30 pm

This course will provide the training needed for the optical engineer to work with the mechanical features of optical systems. The emphasis is on providing techniques for rapid estimation of optical system performance. Subject matter includes material properties for optomechanical design, kinematic design, athermalization techniques, window design, lens and mirror mounting.

LEARNING OUTCOMES

This course will enable you to:

- select materials for use in optomechanical systems
- determine the effects of temperature changes on optical systems, and develop design solutions for those effects
- design high performance optical windows
- design low stress mounts for lenses
- select appropriate mounting techniques for mirrors and prisms
- describe different approaches to large and lightweight mirror design

INTENDED AUDIENCE

Engineers who need to solve optomechanical design problems. Optical designers will find that the course will give insight into the mechanical aspects of optical systems. The course will also interest those managing projects involving optomechanics. Short course SC690, Optical System Design: Layout Principles and Practice, or a firm understanding of its content, is required as background to this course.

INSTRUCTOR

Daniel Vukobratovich is a senior principal engineer at Raytheon. He has over 30 years of experience in optomechanics, is a founding member of the SPIE working group in optomechanics, and is fellow of SPIE. He has taught optomechanics in 11 countries, consulted with over 50 companies and written over 50 publications in optomechanics.

Structural Adhesives for Optical Bonding

SC015

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Tuesday 1:30 pm to 5:30 pm

Optomechanical systems require secure mounting of optical elements. Adhesives are commonly used, but rarely addressed in the literature. This course has compiled an overview of these adhesives, their properties, and how to test them. How to use them is addressed in detail with guidelines and examples provided. A summary of common adhesives is presented with justification for their use. Consideration and analysis of adhesive strength, reliability, and stability are included. Different design approaches to optimize the application are presented and discussed. Many examples are described as well as lessons learned from past experience. Discussions are encouraged to address current problems of course attendees.

LEARNING OUTCOMES

This course will enable you to:

- describe and classify adhesives and how they work (epoxy, urethane, silicone, acrylic, RTV, VU-cure, etc.)
- obtain guidance in: adhesive selection, surface preparation, application, and curing
- develop a basis for analysis of stress and thermal effects
- recognize contamination/outgassing and how to avoid it
- review design options
- create and use an adhesive check list

INTENDED AUDIENCE

This course is for engineers, managers, and technicians. This course provides a foundation for the correct design for successful optical mounting; an understanding of the best options to employ for each application, and the selection and approach conducive to production. A bound course outline (that is a good reference text) is provided, including summaries of popular adhesives and their properties.

INSTRUCTOR

John Daly has 35 years of experience in lasers and optomechanics. Over this period, he has worked optical bonding problems since his thesis projects, as an employee of several major corporations, and now as a consultant. His academic background in mechanical engineering and applied physics compliments this discipline. His work experience has been diverse covering areas such as: military lasers, medical lasers, spectroscopy, point and standoff detection, and E-O systems. His roles over these years have included analysis, design, development, and production. He is a SPIE member, with numerous publications, and is a committee member of the SPIE Optomechanical Engineering Program.

Design of Multiband Optical Systems

New

SC1162

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Multispectral and hyperspectral systems are designed to increase target acquisition performance as well as answer SWaP-C (size/weight/power/cost) requirements for defense and remote sensing systems. Recent developments in optical materials enable optical systems that operate over multiple infrared bands simultaneously. This course describes techniques for designing these systems using existing and new chalcoginide materials, and it provides methods for choosing material combinations, laying out systems, and predicting performance. An emphasis is placed on understanding dispersion and thermal characteristics in order to design achromatic and athermalized dual- and multi-band infrared imaging systems. Additionally, this course will touch upon recent advances in fused, layered, and gradient index infrared optics, specifically with regard to chalcoginide materials.

LEARNING OUTCOMES

This course will enable you to:

- lay out lenses using first order optical design methods
- determine a working set of optical materials based on optical and thermal characteristics
- construct glass maps for dual-band solutions
- optimize glass types using private catalog materials and optimize systems by employing user-defined merit function constraints
- describe axial and radial gradient index infrared materials and explain the advantages/disadvantages of each type

INTENDED AUDIENCE

This course is intended for optical designers and engineers wishing to expand their knowledge of infrared and multiband optics, materials, and design principles. A working understanding of optical design methods and experience with optical design software is recommended.

INSTRUCTOR

Blair Unger is Senior Optical Designer at ASE Optics. He has authored and co-authored papers and patents covering a variety of topics ranging from design of infrared chalcoginide systems to novel solar concentrators. He earned a Ph.D. in Optics at the University of Rochester, Institute of Optics. Dr. Unger is a member of both OSA and SPIE.

COURSE PRICE INCLUDES the text *Optical Design Fundamentals for Infrared Systems, Second Edition* (SPIE, 2001) by Max Riedl.

Optical Systems Engineering

SC1052

Course Level: Introductory
CEU: 0.65 $595 Members | $690 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Optical Systems Engineering emphasizes first-order, system-level estimates of optical performance. Building on the basic principles of optical design, this course uses numerous examples to illustrate the systems-engineering processes of requirements analysis, feasibility and trade studies, subsystem interfaces, error budgets, requirements flowdown and allocation, component specifications, and vendor selection. Topics covered will include an introduction to systems engineering, geometrical optics, aberrations and image quality, radiometry, optical sources, detectors and FPAs, optomechanics, and the integration of these topics for developing a complete optical system.

LEARNING OUTCOMES

This course will enable you to:

- utilize the concepts and terminology of systems engineering as applied to optical system development
- calculate geometrical-optics parameters such as image size, image location, FOV, IFOV, and ground-sample distance (GSD)
- distinguish the various types of optical aberrations; estimate blur size and blur-to-pixel ratio, and their effects on MTF, ground-resolved distance (GRD), and image quality
- quantify radiometric performance, using the concepts of optical transmission, f/#, etendue, scattering, and stray light
- compare source types and properties; estimate radiometric performance; develop source-selection tradeoffs and specifications such as output power, irradiance, radiance, uniformity, stability, and SWaP
- compare FPA and detector types and properties; predict SNR performance combining optical, source, and detector parameters; develop detector-selection tradeoffs and specifications such as sensitivity, dynamic range, uniformity, operability, and SWaP (Size, Weight, and Power)
- explain optical component specifications; estimate thermal, structural, and dynamic effects on the performance of an optical system; utilize the results of STOP (structural, thermal, and optical) analysis and error budgets

INTENDED AUDIENCE

Intended for engineers, scientists, technicians, and managers who are developing, specifying, or purchasing optical, electro-optical, and infrared systems. Prerequisites include a familiarity with Snell's law, the lens equation for simple imaging, and the concepts of wavelength and wavefronts.

INSTRUCTOR

Keith Kasunic has more than 25 years of experience developing optical, electro-optical, infrared, and laser systems. He holds a Ph.D. in Optical Sciences from the University of Arizona, an MS in Mechanical Engineering from Stanford University, and a BS in Mechanical Engineering from MIT. He has worked for or been a consultant to a number of organizations, including Lockheed Martin, Ball Aerospace, Sandia National Labs, Nortel Networks, and Bookham. He is currently the Technical Director of Optical Systems Group, LLC. He is also an Adjunct Professor at Univ. of Central Florida's CREOL – The College of Optics and Photonics, as well as an Affiliate Instructor with Georgia Tech's SENSIAC, and an Instructor for the Optical Engineering Certificate Program at Univ. of California Irvine. This course is based on his textbook Optical Systems Engineering, published by McGraw-Hill in 2011.

COURSE PRICE INCLUDES the text *Optical Systems Engineering* (McGraw-Hill/SPIE Press, 2011) by Keith Kasunic.

Radiometry and its Practical Applications

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:

- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Ms. Grant has taught radiometry and allied subjects for SPIE and other educational, governmental, and corporate organizations since 2009. Her consultancy, Lines and Lights Technology, has been in business since 1994 and she has addressed radiometric and systems problems throughout the spectrum from UV to IR.

COURSE PRICE INCLUDES the texts *The Art of Radiometry* (SPIE Press, 2009) by James M. Palmer and Barbara G. Grant, and the *Field Guide to Radiometry* (SPIE Press, 2011) by Barbara G. Grant .

Infrared Radiometric Calibration

SC1109

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

This course describes the radiometric calibration techniques used for SI-traceable measurements of sources, detectors and material properties in the infrared wavelength region. The main goal is to enable understanding of infrared measurements with quantified uncertainties so that full uncertainty budgets can be established for the final quantities. Examples from NIST calibrations of sources, detectors and materials will be described.

The properties and measurements of various different blackbody and lamp sources will be discussed. Detector calibrations using both thermal and quantum detectors with monochromators and Fourier-transform spectrometers will be covered. Also, infrared reflectance measurements using Fourier-transform spectrometers will be explained. Examples of NIST-developed infrared transfer and working standard radiometers in field deployments will be utilized to illustrate the above concepts.

LEARNING OUTCOMES

This course will enable you to:

- choose the optimal sources for the measurement needs from the different sources available in the field
- list the procedures for selecting and calibrating infrared detectors and their associated uncertainties
- describe the uncertainty propagation principles in both source and detector calibrations
- utilize techniques for infrared material reflectance measurements and their uncertainty propagation
- characterize a radiation thermometer according to ASTM standards

INTENDED AUDIENCE

This course is designed for technical staff involved in radiometric calibrations of sources, detectors and radiometers.

INSTRUCTOR

Howard Yoon graduated with a B.S. Physics and Chemistry degree from Swarthmore College and earned his M.S. and Ph.D. Physics degrees from the University of Illinois at Urbana-Champaign. He has worked for Bell Communications Research and Dartmouth College. He currently serves as the US Representative to the Consultative Committee on Thermometry and is a member of the IEC TC65/SC65B/WG5 committee. While at NIST, he has received the Allen V. Astin Award and the DOC Silver Award. Currently at NIST he is a physicist working on several projects related to advancing spectroradiometry for improvements in fundamental and disseminated standards of spectral radiance, spectral irradiance, and radiance temperature.

George Eppeldauer received his M.E. and Ph.D. Electronics Engineering degrees from the Technical University of Budapest. Previously, he has worked at the Research Institute for Technical Physics at the Hungarian Academy of Sciences. He won the Best Paper Award at the NCSLI Conference in 2004, and he chairs the CIE TC2-48 Technical Committee (TC) on Spectral Responsivity Calibrations and the CIE TC2-29 TC on Detector Linearity. He is an electronics engineer with research areas in detector metrology developing transfer and working standard optical radiometers, photometers, and colorimeters and realizing detector responsivity based scales. The standards he has developed have been utilized to improve the two NIST SI units, the candela and kelvin, the illuminance responsivity scale, the tristimulus color scale, the spectral power, irradiance, and radiance responsivity reference-scales, and the spectral irradiance scale. He was one of the three pioneers who developed the SIRCUS reference responsivity-calibration facility.

Simon Kaplan received a B.A. Physics degree from Oberlin College and Ph.D. Physics degree from Cornell University. Prior to joining NIST, he has worked at the University of Maryland, College Park. He is a physicist with research interests in spectrophotometry and radiometry. He has worked on the characterization of optical materials and components in support of UV photolithography and infrared remote sensing applications. Currently he is leading the Low Background Infrared (LBIR) facility for absolute detector-based irradiance and radiance calibrations in support of missile defense as well as climate monitoring technology.

Charles Gibson is a Physicist in the Sensor Science Division at the National Institute of Standards and Technology. He earned his B.A. degree in Physics at Fisk University. His career at NIST began in 1986 where his research has focused on the measurement of ultraviolet, visible, and near infrared radiation sources. He realizes the NIST national scales and provides calibration services for spectral radiance, spectral irradiance, temperature, and heat flux. Mr. Gibson is active in several international committees for optical radiation measurement. He is a member of ASTM E20 Committee on Temperature Measurement and the ASTM E21.08 Subcommittee on Thermal Protection. He is a group-recipient of the 2008 Department of Commerce Silver Medal Award for Scientific/Engineering Achievement for advancing ultraviolet radiation measurement science for applications in materials processing, semiconductor manufacturing, and space sciences. He is also a co-recipient of the 2005 NIST Allen V. Astin Measurement Science Award for major advances in the realization and dissemination of the NIST spectral irradiance scale widely used in climate-change research.

This course has been designed to complement and build upon the content presented in SC1073, Radiometry and its Practical Applications. Attendees will benefit maximally from attending both courses.

Introduction to Electro-Optical Systems Design

SC1112

Course Level: Intermediate
CEU: 0.65 $580 Members | $675 Non-Members USD
Wednesday 8:30 am to 5:30 pm

Using communication theory, this full-day course explains the universal principles underlying a diverse range of electro-optical systems. From visible / infra-red imaging, to free space optical communications and laser remote sensing, the course relates key concepts in science and systems engineering to practical systems issues. To provide realistic understanding of the concepts presented, many real-world examples are included.

This course summarizes laser propagation fundamentals, coherent and incoherent optical system characterization, the effects of optical turbulence and particulate scattering on propagating laser beams, atmospheric and submarine laser communication systems concepts, and laser radar and optical imaging basics. Also included are discussions of adaptive optics, adaptive image processing, statistical hypothesis testing, and their effect on system performance.

LEARNING OUTCOMES

This course will enable you to:
- perform Fourier and Geometric Optics Analyses of electro-optical systems
- estimate detector noise statistics, detector performance, and signal-to-noise ratio
- perform first order image processing, including statistical image enhancements of incoherent images
- calculate contrast, irradiance and radiance created by the propagation of light in particulate environments
- calculate the system link budgets for laser systems, including synthetic aperture ladar
- perform statistical hypothesis testing, which includes how to calculate logarithmic likelihood ratio tests, test statistics, and probabilities of false alarm and detection
- assess and understand real-world Adaptive Optical system performance

INTENDED AUDIENCE

This course is intended for scientists, technical managers and design engineers who are interested in understanding first-order electro-optical system design and the effects that limit system performance.

INSTRUCTOR

Larry Stotts is a consultant and was the Deputy Office Director in the Strategic Technology Office of the Defense Advanced Research Projects Agency. He earned his Ph.D. in Electrical Engineering (Communications Systems) at the University of California at San Diego. He has published over 102 technical reports and journal articles and 2 co-authored books. Recognition of his work includes a Department of Defense Medal for Distinguished Civilian Service; two Secretary of Defense Medal for Meritorious Civilian Service Awards; two DARPA Technical Achievement Awards; The Technical Cooperation Program Technical Achievement Award, and the Naval Ocean Systems Center Technical Director's Award. Dr. Stotts is a Life Fellow of the SPIE, Fellow of the IEEE and a Senior Member and Fellow of OSA.

COURSE PRICE INCLUDES the text *Fundamentals of Electro-Optic Systems Design: Communications, Lidar and Imaging* by S. Karp and L. B. Stotts (Cambridge Press, 2013).

Infrared Optical Materials, Fabrication and Testing for the Optical Engineer

SC1136

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Tuesday 1:30 pm to 5:30 pm

This course is designed to give the optical engineer or lens designer an introduction to the technologies and techniques of infrared optical materials, fabrication and testing. This knowledge will help the optical engineer understand which optical specifications/tolerances lead to more cost effective optical components. Topics covered include infrared optical materials, traditional, CNC and novel optical fabrication technologies, surface testing and fabrication tolerances.

LEARNING OUTCOMES

This course will enable you to:
- identify key mechanical, chemical and thermal properties of infrared optical materials (glass, crystals and ceramics) and how they affect the optical system performance and cost of optical components
- review the basics of optical fabrication
- define meaningful surface tolerances
- communicate with optical fabricators
- design optical components that are able to be manufactured and measured using state of the art optical fabrication technologies

INTENDED AUDIENCE

Optical engineers, lens designers, or managers who wish to learn more about how infrared optical materials, fabrication and testing affect the optical designer. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Jessica DeGroote Nelson is the R&D manager and scientist at Optimax Systems, Inc. She specializes in optical materials and fabrication processes. She is an adjunct faculty member at The Institute of Optics at the University of Rochester teaching an undergraduate course on Optical Fabrication and Testing, and has given several guest lectures on optical metrology methods. She earned a Ph.D. in Optics at The Institute of Optics at the University of Rochester. Dr. Nelson is a member of both OSA and SPIE.

Basic Optics for Non-Optics Personnel

AVAILABLE IN ONLINE FORMAT

SC609

Course Level: Introductory
CEU: 0.2 $100 Members | $150 Non-Members USD
Wednesday 8:30 am to 11:00 am

This course will provide the technical manager, sales engineering, marketing staff, or other non-optics personnel with a basic, non-mathematical introduction to the terms, specifications, and concepts used in optical technology to facilitate effective communication with optics professionals on a functional level. Topics to be covered include basic concepts such as imaging, interference, diffraction, polarization and aberrations, definitions relating to color and optical quality, and an overview of the basic measures of optical performance such as MTF and wavefront error. The material will be presented with a minimal amount of math, rather emphasizing working concepts, definitions, rules of thumb, and visual interpretation of specifications. Specific applications will include defining basic imaging needs such as magnification, depth-of-field, and MTF as well as the definitions of radiometric terms.

LEARNING OUTCOMES

This course will enable you to:
- read optical system descriptions and papers
- ask the right questions about optical component performance
- describe basic optical specifications for lenses, filters, and other components
- assess differences in types of filters, mirrors and beam directing optics
- know how optics is used in our everyday lives

INTENDED AUDIENCE

This course is intended for the non-optical professional who needs to understand basic optics and interface with optics professionals.

INSTRUCTOR

Kevin Harding has been active in the optics industry for over 30 years, and has taught machine vision and optical methods for over 25 years in over 70 workshops and tutorials, including engineering workshops on machine vision, metrology, NDT, and interferometry used by vendors and system houses to train their own engineers. He has been recognized for his leadership in optics and machine vision by the Society of Manufacturing Engineers, Automated Imaging Association, and Engineering Society of Detroit. Kevin is a Fellow of SPIE and was the 2008 President of the Society.

Engineering Approach to Imaging System Design

SC713

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Monday 8:30 am to 5:30 pm

This course discusses the three popular approaches to electro-optical imaging system design: spatial resolution, sensitivity (signal-to-noise ratio), and modulation transfer function (MTF) analysis. While often evaluated individually, all three must be considered to optimize system design. Usually, the dominant MTFs in machine vision devices are image motion (including random vibration of the sensor), optics (including aberrations), and the detector. For man-in-the-loop operation, the display and the eye are of concern and, in many situations, these limit the overall system performance.

Equally important, but often neglected is sampling; an inherent feature of all electronic imaging systems. Sampling, which creates blocky images are particularly bothersome with periodic targets such as test targets and bar codes. An engineering approach is taken. This course will provide numerous practical design examples (case studies) to illustrate the interplay between subsystem MTFs, resolution, sensitivity, and sampling.

LEARNING OUTCOMES

This course will enable you to:

- use approximations; often called 'rules-of-thumb,' or 'back-of-the-envelope' analysis
- identify the subsystem components that affect resolution and sensitivity
- determine if your system is resolution or sensitivity limited
- equivalently determine if your system is detector-limited or optics-limited
- determine which subsystem limits system performance and why
- understand sampling artifacts (Nyquist frequency limit, aliasing, Moiré patterns, and variations in object edge location and width)
- use MTFs, resolution, sensitivity, and sampling concepts for system optimization
- understand the trade-off between MTF and aliasing

INTENDED AUDIENCE

The course is for managers, system designers, test engineers, machine vision specialists, and camera users who want the best performance from their systems. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference *Infrared Imaging Systems: Design, Analysis, Modeling and Testing* since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and IEEE and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Holst's Practical Guide to Electro-Optical Systems* (JCD Publishing, 2003) by Gerald C. Holst.

Imaging and Sensing Technologies

Fundamentals of Fiber Optic Sensor Design and Technology

New

SC1160

Course Level: Introductory
CEU: 0.65 $545 Members | $640 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course explains basic principles and applications of fiber optic sensor technology. A primary goal of the course is to present the underlying principals associated with the design and application of fiber optic sensor technology.

The course begins with an overview of the fundamental components associated with fiber optic sensors and how they interact to form intensity-based and interferometry-based fiber sensors. It then continues with an overview of physical fiber optic sensors starting with intensity-based sensors and continuing with those based on the Mach-Zehnder, Michelson and Sagnac interferometers. A review of fiber gratings and fiber-etalon-based sensors follows. Examples of applications are given in a wide variety of fields including aerospace and defense, civil structures, oil and gas, and composite manufacturing.

The course continues with an examination of the important emerging areas of chemical and biological fiber sensors – including spectroscopic, refractometric, and more exotic types. Applications ranging from biomedical diagnosis to environmental monitoring will be discussed.

Anyone seeking a rapid and effective introduction to the field of fiber optic sensor technology would benefit greatly from this course. It is intended to strongly complement and serve as an introduction to the *Fiber Optic Sensors and Applications Conference* associated with this Symposium.

LEARNING OUTCOMES

This course will enable you to:

- describe the fundamental components associated with most fiber optic sensors
- explain how components interact and how the performance of a fiber sensor depends on these interactions
- identify common intensity-based fiber sensors, their application areas, their advantages and limitations
- compare the relative advantages of different sensor classes (e.g., intrinsic vs. extrinsic, single-point vs. distributed; active vs. passive) and readout techniques (e.g., wavelength vs. intensity, direct vs. modulated, homodyne vs. heterodyne)
- explain the operation of the Mach-Zehnder, Michelson and Sagnac interferometers and how they are being applied in the field
- determine the strain and temperature response of fiber grating sensors
- describe how fiber grating sensors may be used to supported multi-parameter sensing, including pressure and temperature and multi-axis strain
- understand the operation and applications of evanescent-field, optrode-style, and remote-spectroscopic sensors
- explain the application and operation of fiber-etalon-based sensors
- identify classes of chemical and biological fiber sensors
- be familiar with applications of fiber sensors in medical, chemical, environmental, aerospace, defense, oil and gas, civil structure and manufacturing applications

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to design and apply fiber optic sensors to a wide range of applications. Undergraduate training in engineering or science would be of great benefit.

INSTRUCTOR

Eric Udd has been designing and developing fiber optic sensor technology since 1977, at McDonnell Douglas, Blue Road Research and as President of Columbia Gorge Research since January 2006. He has made fundamental contributions to fiber optic rotation, acoustic, pressure, strain, temperature, and moisture sensors. Mr. Udd has 48 issued patents on fiber optic technology and approximately 170 papers. He is a McDonnell Douglas, SPIE and OSA Fellow and in 2009 was awarded the Richardson Medal by OSA for this work in Fiber Optic Sensors and the field of Fiber Optic Smart Structures.

Robert Lieberman has most recently been the President and Chief Technology Officer of Intelligent Optical Systems, Inc., and serves or has served on the Boards of SPIE, Optech, OptiSense LLC, and Optical Security Sensing LLC. Dr. Lieberman's background includes a Ph.D. in physics from the University of Michigan, and a scientific and technical management career at AT&T Bell Laboratories and Physical Optics Corporation notable for inventions and ground-breaking research projects in microelectronic devices, optical biosensors, physical and chemical sensors, and sensor networks. Dr. Lieberman has written over 50 publications, holds 21 U.S. patents, has chaired numerous conferences on optical sensing, and is a Fellow of SPIE.

COURSE PRICE INCLUDES the text *Fiber Optic Sensor Field Guide* (SPIE Press, 2015), by William B. Spillman and Eric Udd.

Introduction to Optical and Infrared Sensor Systems

SC789

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to optical (near UV-visible) and infrared sensor systems, with an emphasis on systems used in defense and security. Topics include both passive imagers and active laser radars (lidar/ladar). We begin with a discussion of radiometry and radiometric calculations to determine how much optical power is captured by a sensor system. We survey atmospheric propagation and phenomenology (absorption, emission, scattering, and turbulence) and explore how these issues affect sensor systems. Finally, we perform signal calculations that consider the source, the atmosphere, and the optical system and detector, to arrive at a signal-to-noise ratio for typical passive and active sensor systems. These principles of optical radiometry, atmospheric propagation, and optical detection are combined in examples of real sensors studied at the block-diagram level. Sensor system examples include passive infrared imagers, polarization imagers, and hyperspectral imaging spectrometers, and active laser radars (lidars or ladars) for sensing distributed or hard targets. The course organization is approximately one third on the radiometric analysis of sensor systems, one third on atmospheric phenomenology and detector parameters, and one third on example calculations and examination of sensor systems at the block-diagram level.

LEARNING OUTCOMES

This course will enable you to:

- explain and use radiometry for describing and calculating the flow of optical energy in an optical or infrared sensor system
- determine the radiometric throughput of sensor systems
- describe atmospheric phenomenology relevant to propagation of optical and infrared radiation
- explain how the atmosphere affects the performance of sensor systems
- use detector parameters with radiometric calculations to predict the signal received by passive and active sensors
- calculate signal-to-noise ratio for typical sensor systems
- explain real-world sensor systems at the block-diagram level
- explain the difference between and important concepts of passive reflection-based and emission-based imaging
- describe the basic operating principles of passive imagers and active laser radar (lidar/ladar) systems for distributed and solid target sensing

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who find themselves working on (or curious about) optical (uv-vis) and infrared sensor systems without formal training in this area. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Joseph Shaw has been developing optical remote sensing systems and using them in environmental and military sensing for two decades, first at NOAA and currently as professor of electrical engineering and physics at Montana State University. Recognition for his work in this field includes NOAA research awards, a Presidential Early Career Award for Scientists and Engineers, and the World Meteorological Organization's Vaisala Prize. He earned a Ph.D. in Optical Sciences at the University of Arizona. Dr. Shaw is a Fellow of both the OSA and SPIE.

Statistics for Imaging and Sensor Data

SC1072

Course Level: Introductory
CEU: 0.65 $575 Members | $670 Non-Members USD
Monday 8:30 am to 5:30 pm

The purpose of this course is to survey fundamental statistical methods in the context of imaging and sensing applications. You will learn the tools and how to apply them correctly in a given context. The instructor will clarify many misconceptions associated with using statistical methods. The course is full of practical and useful examples of analyses of imaging data. Intuitive and geometric understanding of the introduced concepts will be emphasized. The topics covered include hypothesis testing, confidence intervals, regression methods, and statistical signal processing (and its relationship to linear models). We will also discuss outlier detection, the method of Monte Carlo simulations, and bootstrap.

LEARNING OUTCOMES

- apply the statistical methods suitable for a given context
- demonstrate the statistical significance of your results based on hypothesis testing
- construct confidence intervals for a variety of imaging applications
- fit predictive equations to your imaging data
- construct confidence and prediction intervals for a response variable as a function of predictors
- explain the basics of statistical signal processing and its relationship to linear regression models
- perform correct analysis of outliers in data
- implement the methodology of Monte Carlo simulations

INTENDED AUDIENCE

This course is intended for participants who need to incorporate fundamental statistical methods in their work with imaging data. Participants are expected to have some experience with analyzing data.

INSTRUCTOR

Peter Bajorski is Professor of Statistics and Graduate Program Chair at the Rochester Institute of Technology. He teaches graduate and undergraduate courses in statistics including a course on Multivariate Statistics for Imaging Science. He also designs and teaches short courses in industry, with longer-term follow-up and consulting. He performs research in statistics and in hyperspectral imaging. Dr. Bajorski wrote a book on Statistics for Imaging, Optics, and Photonics published in a prestigious Wiley Series in Probability and Statistics. He is a senior member of SPIE and IEEE.

COURSE PRICE INCLUDES the text *Statistics for Imaging, Optics, and Photonics* (Wiley, 2011) by Peter Bajorski.

Design of Multiband Optical Systems

New

SC1162

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Multispectral and hyperspectral systems are designed to increase target acquisition performance as well as answer SWaP-C (size/weight/power/cost) requirements for defense and remote sensing systems. Recent developments in optical materials enable optical systems that operate over multiple infrared bands simultaneously. This course describes techniques for designing these systems using existing and new chalcoginide materials, and it provides methods for choosing material combinations, laying out systems, and predicting performance. An emphasis is placed on understanding dispersion and thermal characteristics in order to design achromatic and athermalized dual- and multi-band infrared imaging systems. Additionally, this course will touch upon recent advances in fused, layered, and gradient index infrared optics, specifically with regard to chalcoginide materials.

LEARNING OUTCOMES

This course will enable you to:

- lay out lenses using first order optical design methods
- determine a working set of optical materials based on optical and thermal characteristics
- construct glass maps for dual-band solutions
- optimize glass types using private catalog materials and optimize systems by employing user-defined merit function constraints
- describe axial and radial gradient index infrared materials and explain the advantages/disadvantages of each type

INTENDED AUDIENCE

This course is intended for optical designers and engineers wishing to expand their knowledge of infrared and multiband optics, materials, and design principles. A working understanding of optical design methods and experience with optical design software is recommended.

INSTRUCTOR

Blair Unger is Senior Optical Designer at ASE Optics. He has authored and co-authored papers and patents covering a variety of topics ranging from design of infrared chalcoginide systems to novel solar concentrators. He earned a Ph.D. in Optics at the University of Rochester, Institute of Optics. Dr. Unger is a member of both OSA and SPIE.

COURSE PRICE INCLUDES the text *Optical Design Fundamentals for Infrared Systems, Second Edition* (SPIE, 2001) by Max Riedl.

Radiometry and its Practical Applications

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:

- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Ms. Grant has taught radiometry and allied subjects for SPIE and other educational, governmental, and corporate organizations since 2009. Her consultancy, Lines and Lights Technology, has been in business since 1994 and she has addressed radiometric and systems problems throughout the spectrum from UV to IR.

COURSE PRICE INCLUDES the texts *The Art of Radiometry* (SPIE Press, 2009) by James M. Palmer and Barbara G. Grant, and the *Field Guide to Radiometry* (SPIE Press, 2011) by Barbara G. Grant .

Introduction to Electro-Optical Systems Design

SC1112

Course Level: Intermediate
CEU: 0.65 $580 Members | $675 Non-Members USD
Wednesday 8:30 am to 5:30 pm

Using communication theory, this full-day course explains the universal principles underlying a diverse range of electro-optical systems. From visible / infra-red imaging, to free space optical communications and laser remote sensing, the course relates key concepts in science and systems engineering to practical systems issues. To provide realistic understanding of the concepts presented, many real-world examples are included.

This course summarizes laser propagation fundamentals, coherent and incoherent optical system characterization, the effects of optical turbulence and particulate scattering on propagating laser beams, atmospheric and submarine laser communication systems concepts, and laser radar and optical imaging basics. Also included are discussions of adaptive optics, adaptive image processing, statistical hypothesis testing, and their effect on system performance.

LEARNING OUTCOMES

This course will enable you to:
- perform Fourier and Geometric Optics Analyses of electro-optical systems
- estimate detector noise statistics, detector performance, and signal-to-noise ratio
- perform first order image processing, including statistical image enhancements of incoherent images
- calculate contrast, irradiance and radiance created by the propagation of light in particulate environments
- calculate the system link budgets for laser systems, including synthetic aperture ladar
- perform statistical hypothesis testing, which includes how to calculate logarithmic likelihood ratio tests, test statistics, and probabilities of false alarm and detection
- assess and understand real-world Adaptive Optical system performance

INTENDED AUDIENCE

This course is intended for scientists, technical managers and design engineers who are interested in understanding first-order electro-optical system design and the effects that limit system performance.

INSTRUCTOR

Larry Stotts is a consultant and was the Deputy Office Director in the Strategic Technology Office of the Defense Advanced Research Projects Agency. He earned his Ph.D. in Electrical Engineering (Communications Systems) at the University of California at San Diego. He has published over 102 technical reports and journal articles and 2 co-authored books. Recognition of his work includes a Department of Defense Medal for Distinguished Civilian Service; two Secretary of Defense Medal for Meritorious Civilian Service Awards; two DARPA Technical Achievement Awards; The Technical Cooperation Program Technical Achievement Award, and the Naval Ocean Systems Center Technical Director's Award. Dr. Stotts is a Life Fellow of the SPIE, Fellow of the IEEE and a Senior Member and Fellow of OSA.

COURSE PRICE INCLUDES the text *Fundamentals of Electro-Optic Systems Design: Communications, Lidar and Imaging* by S. Karp and L. B. Stotts (Cambridge Press, 2013).

Uncooled Thermal Imaging Detectors and Systems

SC900

Course Level: Intermediate
CEU: 0.65 $555 Members | $650 Non-Members USD
Monday 8:30 am to 5:30 pm

The success of uncooled infrared imaging in commercial and military markets has greatly increased the number of participants in the field, and, consequently, the variety of products available and in development. The intent of this course is to provide attendees a broad view of the field as well as an in-depth look at important technologies. The course describes the fundamentals of uncooled IR imaging arrays, emphasizing resistive bolometric and ferroelectric/pyroelectric detectors, but also including a number of innovative technologies such as thermally activated cantilevers, thin films with temperature-dependent optical transmission properties, and thermal-capacitive detectors. Students will learn the fundamentals of uncooled IR sensors, how the various technologies operate, the merits and deficiencies of the different technologies, quantitative metrics for evaluating and comparing performance, and how key factors influence those metrics. The course also explores the limits of performance of uncooled IR imaging, as well as trends to be expected in future products.

LEARNING OUTCOMES

This course will enable you to:
- describe the operation of uncooled IR detectors and basic readout circuits
- evaluate performance in terms of responsivity, noise, noise equivalent temperature difference, minimum resolvable temperature, and response time
- gauge the fundamental limits to their performance, including temperature-fluctuation noise and background fluctuation noise
- compare theory with measured performance of the uncooled arrays
- evaluate practical issues and limitations of current technology
- ascertain the state of development of new IR technologies by asking the right questions
- differentiate well-developed concepts from ill-conceived notional concepts
- identify the uncooled IR technology best suited to your needs
- assess the performance potential of novel IR imaging technologies
- evaluate quantitatively the performance of a wide variety of uncooled IR detectors
- summarize construction details from the technical literature.

INTENDED AUDIENCE

This material is intended for engineers, scientists, and managers who need a background knowledge of uncooled IR technologies, for those who need to be able to evaluate those technologies for usefulness in particular applications, and for those working in the field who wish to deepen their knowledge and understanding. Anyone concerned with current and future directions in thermal imaging or involved in the development of IR detector technology or advanced uncooled IR system concepts will find this course valuable. The course has a significant mathematical content designed to illustrate the origin of the principles involved, but knowledge of the mathematics is not required to understand the concepts and results.

INSTRUCTOR

Charles Hanson has a Ph.D. in theoretical solid-state physics from Georgetown University. After retiring as CTO of L-3 Infrared Products in 2011, he has assumed a position as infrared technologies at Texas Instruments. He has held government and industrial positions in infrared imaging for 45 years. He is a past chairman of Military Sensing Symposia (MSS) Passive Sensors and is presently co-chair of the SPIE Infrared Technology and Applications conference.

COURSE PRICE INCLUDES the text *Uncooled Thermal Imaging Arrays, Systems, and Applications* (SPIE Press, 2001) by Paul Kruse.

Target Detection Algorithms for Hyperspectral Imagery

SC995

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to the basic concept of automatic target and object detection and its applications in Hyperspectral Imagery (HSI). The primary goal of this course is to introduce the well known target detection algorithms in hyperspectral imagery. Examples of the classical target detection techniques such as spectral matched filter, subspace matched filter, adaptive matched filter, orthogonal subspace, support vector machine (SVM) and machine learning are reviewed. Construction of invariance subspaces for target and background as well as the use of regularization techniques are presented. Standard atmospheric correction and compensation techniques are reviewed. Anomaly detection techniques for HSI and dual band FLIR imagery are also discussed. Applications of HSI for detection of mines, targets, humans, chemical plumes and anomalies are reviewed.

LEARNING OUTCOMES

This course will enable you to:

- describe the fundamental concepts of target detection algorithms as applied to HSI
- learn the procedure to use the generalized maximum likelihood ratio test to design spectral detectors
- describe the fundamental differences between different detection algorithms based on their model representations
- develop statistical models as well as subspace models for HSI data
- explain the difference between anomaly detection and classification
- distinguish between linear and nonlinear approaches (SVM and Kernel learning techniques)
- develop anomaly detection techniques for different environmental scenarios
- describe linear models and unmixing techniques for abundance measures
- plot ROC curves to evaluate the performance of the algorithms

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about target detection in hyperspectral, multispectral or dual-band FLIR imagery. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Nasser Nasrabadi is a senior research scientist (ST) at US Army Research Laboratory (ARL). He is also an adjunct professor in the Electrical and Computer Engineering Department at the Johns Hopkins University. He is actively engaged in research in image processing, neural networks, automatic target recognition, and video compression and its transmission over high speed networks. He has published over 200 papers in journals and conference proceedings. He has been an associate editor for the IEEE Transactions on Image Processing,IEEE Transactions on Circuits and Systems for Video Technology and IEEE Transactions for Neural Networks. He is a Fellow of IEEE and SPIE.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:

- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Qian (Jenny) Du has been conducting research on hyperspectral image processing and analysis for more than fifteen years. She has numerous peer-reviewed publications in this field, and developed several well-received algorithms. She currently is Bobby Shackouls Professor in the Department of Electrical and Computer Engineering at Mississippi State University. Dr. Du was a selected lecturer for IEEE Geoscience and Remote Sensing Symposium in 2009-2013, and a selected lecturer for the 5th IEEE GRSS Workshop on Hyperspectral Signal and Image Processing: Evolution in Remote Sensing (WHISPERS). She is an Associate Editor for IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing, IEEE Signal Processing Letters, and SPIE Journal of Applied Remote Sensing.

Infrared Systems - Technology & Design

SC835

Course Level: Advanced
CEU: 1.3 $1,045 Members | $1,265 Non-Members USD
Monday - Tuesday 8:30 am to 5:30 pm

This course covers the range of topics necessary to understand the theoretical principles of modern infrared-technology. It combines numerous engineering disciplines necessary for the development of infrared systems. Practical engineering calculations are highlighted, with examples of trade studies illustrating the interrelationships among the various hardware characteristics.

This course is comprised of four sections:

Section 1 introduces the geometrical optics concepts including image formation, stops and pupils, thick lenses and lens combinations, image quality, and the properties of infrared materials.

Section 2 covers the essentials of radiometry necessary for the quantitative understanding of infrared signatures and flux transfer. These concepts are then developed and applied to flux-transfer calculations for blackbody, graybody, and selective radiator sources. Remote temperature calibrations and measurements are then used as an illustration of these radiometric principles.

Section 3 is devoted to fundamental background issues for optical detection-processes. It compares the characteristics of cooled and uncooled detectors with an emphasis on spectral and blackbody responsivity, detectivity (D*), as well as the noise mechanisms related to optical detection. The detector parameters and capabilities of single detectors and third generation focal plane arrays (FPAs) are analyzed.

With this acquired background, Section 4 considers the systems-design aspects of infrared imagers. The impact of scan format on signal-to-noise ratio is described, and the engineering tradeoffs inherent in the development of infrared search and track (IRST) systems are explained. Figures of merit such as MTF, NETD, and MRTD of staring arrays are examined for the performance metrics of thermal sensitivity and spatial resolution of thermal imaging systems (TIS). Contrast threshold functions based on Johnson and visible cycles (often denoted as N- and V-cycles) are specified. The interrelationships among the design parameters are identified through trade-study examples.

LEARNING OUTCOMES

This course will enable you to:

- learn the principles and fundamentals of infrared optical design
- choose the proper infrared materials suite for your applications
- quickly execute flux-transfer calculations
- calibrate infrared sources and target signatures
- recognize the importance of background in thermal signatures
- have an appreciation for the capacity of infrared systems and learn the interaction of its critical components (optics, detectors, and electronics) in the production of a final infrared image
- assess the influence of noise mechanisms related to optical detection
- comprehend the fundamental response mechanisms and differences between cooled and uncooled single detectors as well as focal plane arrays (FPAs)
- comprehend the central theory behind third generation infrared imagers
- define and use common descriptors for detector and system performance (R, D*, NEP, NEI, MTF, NETD, and MRTD)
- estimate system performance given subsystem and component specifications
- apply design tradeoffs in both infrared search and track systems (IRST) and thermal-imaging systems (TIS)
- carry out the preliminary design of infrared systems for different thermal applications

INTENDED AUDIENCE

This course is directed to the practicing engineers and/or scientists who require both theoretical and effective practical technical information to design, build, and/or test infrared systems in a wide variety of thermal applications. A background at the bachelor's level in engineering is highly recommended. The participant should also have ample understanding of Fourier analysis and random processes.

INSTRUCTOR

Arnold Daniels is a senior lead engineer with extensive experience in the conceptual definition of advance infrared, optical, and electro-optical systems. His background consists of technical contributions to applications for infrared search & track, thermal imaging, and ISR systems. Other technical expertise include infrared radiometry (testing and measurements), infrared test systems (i.e., MTF, NETD, and MRTD), thermographic nondestructive testing (TNDT), optical design, precision optical alignment, stray light analysis, adaptive optics, Fourier analysis, image processing, and data acquisition systems. He earned an M.S. in Electrical Engineering from the University of Tel-Aviv and a doctorate in Electro-Optics from the School of Optics (CREOL) at the University of Central Florida. In 1995 he received the Rudolf Kingslake medal and prize for the most noteworthy original paper to appear in SPIE's Journal of Optical Engineering. He is presently developing direct energy laser weapon systems for defense applications.

COURSE PRICE INCLUDES the *Field Guide to Infrared Systems, Detectors, and FPAs, 2nd Edition* by Arnold Daniels (SPIE, 2010) and *Infrared Detectors and Systems* (Wiley, 1996) by Eustace L. Dereniak and Glenn D. Boreman.

Electro-Optical Imaging System Performance

SC154

Course Level: Intermediate
CEU: 0.65 $600 Members | $695 Non-Members USD
Thursday 8:30 am to 5:30 pm

While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). System analysis could be performed in the spatial domain. However, it is far easier to work in the frequency domain using MTFs. Subsystem MTFs are combined for overall system analysis. This is often called image chain modeling. Although the math is sometimes complex, the equations are graphed for easy understanding. With the Sept 2002 models (e.g., NVTherm), the minimum resolvable temperature (MRT) and minimum resolvable contrast (MRC) are coupled with the target signature and atmospheric transmittance to provide range performance predictions (target acquisition modeling). Three ranges are predicted: detection, recognition, and identification (often shorten to DRI). DRI ranges depend upon the subsystem MTFs, noise (primarily random and fixed pattern noise), the display, and the eye's response. The two-dimensional (fictitious) spatial frequency approach, three-dimensional noise model, and target discrimination metrics (Johnson's N50) are applied to performance predictions. The 2007 models (e.g., NVThermIP) employ contrast rather than MRT (MRC) for target acquisition and use V50 as a discrimination metric. Limitations and applications of NVTherm and NVThermIP are discussed with a brief demonstration of the models. Selection and optimization of a specific sensor depends upon a myriad of radiometric, spectral, and spatial parameters (e.g., target signature, atmospheric conditions, optics f-number, field-of-view, and detector responsivity). MTFs and their effect on imagery are interactively demonstrated. Spatial sampling is present in all cameras. Super-resolution reconstruction and microscan minimize sampling artifacts. Several optimization examples are discussed (case study examples).

LEARNING OUTCOMES

This course will enable you to:

- use the correct MTFs for image chain analysis
- describe the radiometric relationship between delta-T and spectral radiance

- compare the differences among scanning, staring, and microscan staring array performance
- recognize the limitations of back-of-the-envelope approximations such as resolution and sensitivity
- identify the subsystem (e.g., motion, optics, detector, electronics, and display) that limits performance
- appreciate limitations of range performance predictions (target acquisition predictions)
- determine if mid-wave (MWIR) or long-wave (LWIR) infrared is appropriate for your application
- appreciate the value of graphs rather than a table of numbers
- be conversant with the myriad of technological terms
- become a smart buyer, analyst, and/or user of imaging systems

INTENDED AUDIENCE

This course is intended for engineers, managers, and buyers who want to understand the wealth of information available from imaging system end-to-end analysis. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Electro-Optical Imaging System Performance, Fifth Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Multispectral and Hyperspectral Image Sensors

SC194

Course Level: Advanced
CEU: 0.35 $375 Members | $425 Non-Members USD
Tuesday 8:30 am to 12:30 pm

This course will describe the imaging capabilities and applications of the principal types of multispectral (MS) and hyperspectral (HS) sensors. The focus will be on sensors that work in the visible, near-infrared and shortwave-infrared spectral regimes, but the course will touch on longwave-infrared applications. A summary of the salient features of classical color imaging (human observation) will also be provided in an appendix.

LEARNING OUTCOMES

This course will enable you to:

- understand many of the applications and advantages of multispectral (MS) and hyperspectral (HS) imaging
- describe and categorize the properties of the principal MS / HS design types (multi-band scanner, starers with filter wheels, dispersive, wedge, and Fourier transform imagers with 2D arrays, etc.)
- list and define the relevant radiometric radiometric quantities, concepts and phenomenology
- understand the process of translating system requirements into sensor hardware constraints and specifications
- analyze signal-to-noise ratio, modulation-transfer-function, and spatial / spectral sampling for MS and HS sensors
- define, understand and apply the relevant noise-equivalent figures-of-merit (Noise-equivalent reflectance difference, Noise-equivalent temperature difference, Noise-equivalent spectral radiance, Noise-equivalent irradiance, etc.)
- describe the elements of the image chain from photons-in to bits-out (photon detection, video signal manipulation, analog processing, and digitization)
- list and review key imager subsystem technology elements (optical, focal plane, video electronics, and thermal)
- formulate a detailed end-to-end design example of a satellite imaging scanning HS sensor
- provide an appendix that summarizes color imaging principles and sensor associated elements for human observation applications (e.g. color television, still cameras, etc.)

INTENDED AUDIENCE

Engineers, scientists, and technical managers who are interested in understanding and applying multispectral and hyperspectral sensors in advanced military, civil, scientific and commercial applications.

INSTRUCTOR

Terrence Lomheim holds the position of Distinguished Engineer at The Aerospace Corp. He has 34 years of hardware and analysis experience in visible and infrared electro-optical systems, focal plane technology, and applied optics, and has authored and co-authored 63 publications in these technical areas. He is a Fellow of the SPIE.

COURSE PRICE INCLUDES the text *CMOS/CCD Sensors and Camera Systems, 2nd edition* (SPIE Press, 2011) by Terrence Lomheim and Gerald Holst.

Testing and Evaluation of E-O Imaging Systems

SC067

Course Level: Advanced
CEU: 0.65 $595 Members | $690 Non-Members USD
Friday 8:30 am to 5:30 pm

This course describes all the quantitative and qualitative metrics that are used to characterize imaging system performance. While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). Data analysis techniques are independent of the sensor selected (i.e., wavelength independent). The difference lies in the input variable name (watts, lumens, or delta-T) and the output variable name (volts, lumens, or observer response). Slightly different test methodologies are used for visible and thermal imaging systems. Performance parameters discussed include resolution, responsivity, aperiodic transfer function, slit response function, random noise, uniformity, fixed pattern noise, modulation transfer function (MTF), contrast transfer function (CTF), minimum resolvable temperature (MRT), and the minimum resolvable contrast (MRC). The eye's spatial and temporal integration allows perception of images whose signal-to-noise ratio (SNR) is less than unity. Since all imaging system spatially sample the scene, sampling artifacts occur in all imagery and therefore affects all measurements. Sampling can significantly affect MRT and MTF tests. Low SNR and sampling effects are interactively demonstrated. This course describes the most common testing techniques. Equally important is identifying those parameters that adversely affect results.

LEARNING OUTCOMES

This course will enable you to:

- write concise test procedures with unambiguous system specifications
- identify all appropriate test parameters
- describe the radiometric relationship between delta-T and spectral radiance
- differentiate between observer variability and system response during MRC and MRT testing
- describe the difference between the CTF and the MTF
- learn about the latest MTF measurement techniques
- discern the difference between poor system performance, peculiarities of the system under test, and measurement errors
- assess how sampling affects test results
- appreciate the benefits and short comings of fully automated testing

- identify parameters that can lead to poor results.
- learn about evolving standardized testing concepts

INTENDED AUDIENCE

The course is for managers, specification writers, and test engineers involved with all phases of imaging system characterization ranging from satisfying customer requirements to ensuring that specifications are unambiguous and testable.

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Testing and Evaluation of Infrared Imaging Systems, Third Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Engineering Approach to Imaging System Design

SC713

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Monday 8:30 am to 5:30 pm

This course discusses the three popular approaches to electro-optical imaging system design: spatial resolution, sensitivity (signal-to-noise ratio), and modulation transfer function (MTF) analysis. While often evaluated individually, all three must be considered to optimize system design. Usually, the dominant MTFs in machine vision devices are image motion (including random vibration of the sensor), optics (including aberrations), and the detector. For man-in-the-loop operation, the display and the eye are of concern and, in many situations, these limit the overall system performance.

Equally important, but often neglected is sampling; an inherent feature of all electronic imaging systems. Sampling, which creates blocky images are particularly bothersome with periodic targets such as test targets and bar codes. An engineering approach is taken. This course will provide numerous practical design examples (case studies) to illustrate the interplay between subsystem MTFs, resolution, sensitivity, and sampling.

LEARNING OUTCOMES

This course will enable you to:

- use approximations; often called ‘rules-of-thumb,’ or ‘back-of-the-envelope’ analysis
- identify the subsystem components that affect resolution and sensitivity
- determine if your system is resolution or sensitivity limited
- equivalently determine if your system is detector-limited or optics-limited
- determine which subsystem limits system performance and why
- understand sampling artifacts (Nyquist frequency limit, aliasing, Moiré patterns, and variations in object edge location and width)
- use MTFs, resolution, sensitivity, and sampling concepts for system optimization
- understand the trade-off between MTF and aliasing

INTENDED AUDIENCE

The course is for managers, system designers, test engineers, machine vision specialists, and camera users who want the best performance from their systems. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference *Infrared Imaging Systems: Design, Analysis, Modeling and Testing* since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and IEEE and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Holst’s Practical Guide to Electro-Optical Systems* (JCD Publishing, 2003) by Gerald C. Holst.

Infrared Focal Plane Arrays

SC152

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Monday 8:30 am to 5:30 pm

The course presents a fundamental understanding of two-dimensional arrays applied to detecting the infrared spectrum. The physics and electronics associated with 2-D infrared detection are stressed with special emphasis on the hybrid architecture unique to two-dimensional infrared arrays.

LEARNING OUTCOMES

This course will enable you to:

- develop the building blocks of 2-D arrays
- explain charge transfer concepts of various architectures
- describe various input electronics circuits
- discuss testing techniques used in the IR for 2-D arrays
- provide an overview of current technologies
- demonstrate aliasing effects
- describe digital FPAs
- review room-temperature thermal arrays
- review uncooled photon arrays
- discuss dual band arrays
- discuss small pixel pitch devices
- review HOT devices
- compare II-VI vs. III-V devices

INTENDED AUDIENCE

This material is intended for engineers, scientists and project managers who need to learn more about two-dimensional IR arrays from a user’s point of view. It gives the student insight into the optical detection process, as well as what is available to application engineers, advantages, characteristics and performance.

INSTRUCTOR

Eustace Dereniak is a Professor of Optical Sciences and Electrical and Computer Engineering at the University of Arizona, Tucson, AZ. His research interests are in the areas of detectors for optical radiation, imaging spectrometers and imaging polarimeters instrument development. Dereniak is a co-author of several textbooks and has authored book chapters. His publications also include over 100 authored or co-authored refereed articles. He spent many years in industrial research with Raytheon, Rockwell International, and Ball Brothers Research Corporation. He has taught extensively and is a Fellow of the SPIE and OSA, and a member of the Board of Directors of SPIE.

John Hubbs is an engineer at the Infrared Radiation Effects Laboratory (IRREL). Dr. Hubbs has over 30 years of experience characterizing focal plane arrays (FPAs) in both clear and radiation environments. His research interests are in the areas of detectors for optical radiation and radiation effects on infrared focal plane arrays, which has resulted in the publication of over 75 papers. He is a Fellow of the SPIE and the Military Sensing Symposium (MSS).

Analog-to-Digital Converters for Digital ROICs

SC1076

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course surveys structure and operation of analog-to-digital converters (ADCs) implemented on digital readout integrated circuits (ROICs) and digital image sensors. Attendees will learn how to evaluate ADC architectures using basic figures of merit for use in different sensor formats. We will cover a wide range of cutting edge architectures and see published examples without delving into transistor level theory. We will survey both academia and industrial ADC architectures. From this survey attendees will discover the industrial design evolution convergence down to a few workhorse architectures and what lessons it imparts to the image sensor community. If you are interested in the digital ROIC revolution or if you ever interface with designers or evaluate digital ROIC proposals, then you will benefit from taking this course.

LEARNING OUTCOMES

This course will enable you to:
- identify analog-to-digital architectures used for creating digital ROICs and image sensors
- calculate ADC architecture figures of merit important to image sensors
- evaluate ADC architecture compatibility with image sensor format and requirements
- infer the direction in which state-of-the-art digital image sensors are headed
- name the top ADC architectures used by commercial industry and explain how this knowledge benefits the image sensor industry
- stimulate your own creativity and help you develop new ideas and applications for digital ROICs and digital image sensors

INTENDED AUDIENCE

This course is intended for engineers and physicists with a background in basic electrical theory (electrical stimuli, resistors, capacitors and block diagramming) who wish to learn about analog-to-digital converter architectures and how they are applied to digital ROICs and digital image sensors. An undergraduate degree in science or engineering is assumed, and basic knowledge of electrical engineering will be particularly helpful.

INSTRUCTOR

Kenton Veeder is a ROIC design engineer, systems engineer, and part time detector physicist. He has been in the defense and commercial image sensor field for over 12 years and is the president of Senseeker Engineering Inc. in Santa Barbara, California. He has nine patents and several publications, one of which earned the MSS Detectors best paper award in 2006. While working for Raytheon he was awarded recognition as Raytheon's 'Father of the Digital Focal Plane Array' and he and his team were given the company wide 'Excellence In Technology' award. Kenton earned his M.S. in electrical engineering from the Analog-and-Mixed Signal Center at Texas A&M University. Kenton is a member of SPIE and IEEE.

Infrared Radiometric Calibration

SC1109

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

This course describes the radiometric calibration techniques used for SI-traceable measurements of sources, detectors and material properties in the infrared wavelength region. The main goal is to enable understanding of infrared measurements with quantified uncertainties so that full uncertainty budgets can be established for the final quantities. Examples from NIST calibrations of sources, detectors and materials will be described.

The properties and measurements of various different blackbody and lamp sources will be discussed. Detector calibrations using both thermal and quantum detectors with monochromators and Fourier-transform spectrometers will be covered. Also, infrared reflectance measurements using Fourier-transform spectrometers will be explained. Examples of NIST-developed infrared transfer and working standard radiometers in field deployments will be utilized to illustrate the above concepts.

LEARNING OUTCOMES

This course will enable you to:
- choose the optimal sources for the measurement needs from the different sources available in the field
- list the procedures for selecting and calibrating infrared detectors and their associated uncertainties
- describe the uncertainty propagation principles in both source and detector calibrations
- utilize techniques for infrared material reflectance measurements and their uncertainty propagation
- characterize a radiation thermometer according to ASTM standards

INTENDED AUDIENCE

This course is designed for technical staff involved in radiometric calibrations of sources, detectors and radiometers.

INSTRUCTOR

Howard Yoon graduated with a B.S. Physics and Chemistry degree from Swarthmore College and earned his M.S. and Ph.D. Physics degrees from the University of Illinois at Urbana-Champaign. He has worked for Bell Communications Research and Dartmouth College. He currently serves as the US Representative to the Consultative Committee on Thermometry and is a member of the IEC TC65/SC65B/WG5 committee. While at NIST, he has received the Allen V. Astin Award and the DOC Silver Award. Currently at NIST he is a physicist working on several projects related to advancing spectroradiometry for improvements in fundamental and disseminated standards of spectral radiance, spectral irradiance, and radiance temperature.

George Eppeldauer received his M.E. and Ph.D. Electronics Engineering degrees from the Technical University of Budapest. Previously, he has worked at the Research Institute for Technical Physics at the Hungarian Academy of Sciences. He won the Best Paper Award at the NCSLI Conference in 2004, and he chairs the CIE TC2-48 Technical Committee (TC) on Spectral Responsivity Calibrations and the CIE TC2-29 TC on Detector Linearity. He is an electronics engineer with research areas in detector metrology developing transfer and working standard optical radiometers, photometers, and colorimeters and realizing detector responsivity based scales. The standards he has developed have been utilized to improve the two NIST SI units, the candela and kelvin, the illuminance responsivity scale, the tristimulus color scale, the spectral power, irradiance, and radiance responsivity reference-scales, and the spectral irradiance scale. He was one of the three pioneers who developed the SIRCUS reference responsivity-calibration facility.

Simon Kaplan received a B.A. Physics degree from Oberlin College and Ph.D. Physics degree from Cornell University. Prior to joining NIST, he has worked at the University of Maryland, College Park. He is a physicist with research interests in spectrophotometry and radiometry. He has worked on the characterization of optical materials and components in support of UV photolithography and infrared remote sensing applications. Currently he is leading the Low Background Infrared (LBIR) facility for absolute detector-based irradiance and radiance calibrations in support of missile defense as well as climate monitoring technology.

Charles Gibson is a Physicist in the Sensor Science Division at the National Institute of Standards and Technology. He earned his B.A. degree in Physics at Fisk University. His career at NIST began in 1986 where his research has focused on the measurement of ultraviolet, visible, and near infrared radiation sources. He realizes the NIST national scales and provides calibration services for spectral radiance, spectral irradiance, temperature, and heat flux. Mr. Gibson is active in several international committees for optical radiation measurement. He is a member of ASTM E20 Committee on Temperature Measurement and the ASTM E21.08 Subcommittee on Thermal Protection. He is a group-recipient of the 2008 Department of Commerce Silver Medal Award for Scientific/Engineering Achievement for advancing ultraviolet radiation measurement science for applications in materials processing, semiconductor manufacturing, and space sciences. He is also a co-recipient of the 2005 NIST Allen V. Astin Measurement Science Award for major advances in the realization and dissemination of the NIST spectral irradiance scale widely used in climate-change research.

This course has been designed to complement and build upon the content presented in SC1073, Radiometry and its Practical Applications. Attendees will benefit maximally from attending both courses.

Infrared Optical Materials, Fabrication and Testing for the Optical Engineer

SC1136

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Tuesday 1:30 pm to 5:30 pm

This course is designed to give the optical engineer or lens designer an introduction to the technologies and techniques of infrared optical materials, fabrication and testing. This knowledge will help the optical engineer understand which optical specifications/tolerances lead to more cost effective optical components. Topics covered include infrared optical materials, traditional, CNC and novel optical fabrication technologies, surface testing and fabrication tolerances.

LEARNING OUTCOMES

This course will enable you to:

- identify key mechanical, chemical and thermal properties of infrared optical materials (glass, crystals and ceramics) and how they affect the optical system performance and cost of optical components
- review the basics of optical fabrication
- define meaningful surface tolerances
- communicate with optical fabricators
- design optical components that are able to be manufactured and measured using state of the art optical fabrication technologies

INTENDED AUDIENCE

Optical engineers, lens designers, or managers who wish to learn more about how infrared optical materials, fabrication and testing affect the optical designer. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Jessica DeGroote Nelson is the R&D manager and scientist at Optimax Systems, Inc. She specializes in optical materials and fabrication processes. She is an adjunct faculty member at The Institute of Optics at the University of Rochester teaching an undergraduate course on Optical Fabrication and Testing, and has given several guest lectures on optical metrology methods. She earned a Ph.D. in Optics at The Institute of Optics at the University of Rochester. Dr. Nelson is a member of both OSA and SPIE.

Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation

SC1137

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Passive and active sensors are developed for target acquisition and spectroscopic analysis ranging from the ultraviolet through the microwave region. Accurate atmospheric absorption and emission (path radiance) values are essential for sensor development. This data is obtained using MODTRAN, often used in conjunction with NVThermIP, and other sensor software. HITRAN and FASCODE are used for laser applications.

Emphasis will be placed on solving real world problems. Four typical scenarios will be presented: ground-to-ground, ground-to-air, air-to- air and ground-to-space scenarios. The importance of transmission and radiance for each scenario will be discussed.

The students are encouraged to bring their specific scenarios to the course to be setup and run. A computer will be available and we will run these scenarios and discuss the results. The attendees will be able to take home model input files to be used at their facilities. We will discuss their cases along with the expected transmission and atmospheric radiance values.

LEARNING OUTCOMES

This course will enable you to:

- present an overview and explain the “theory” of the models: emphasis on MODTRAN
- apply the models to atmospheric transmission/radiance, smart weapons for defense applications, EO sensors development/ evaluations, ground and satellite image correction, hyperspectral imaging, laser spectroscopy laser communications and LIDAR/ LADAR systems.
- evaluate a “basic” problem: You are on the ground looking up to an aircraft. Your partner is on the aircraft looking down at the ground. Do you and your partner measure the same atmospheric transmission? Do you and your partner measure the same radiance? Why?
- identify MODTRAN assumptions, capabilities and limitations
- define basic model inputs – i.e. “MODTRAN for Dummies”
- utilize advanced model inputs such as radiosonde data, Lambertian surfaces, BRDF etc.
- solve and run your own specific scenarios
- compare other models and databases: FASCODE, EOSAEL, HITRAN, NVThermIP etc.

INTENDED AUDIENCE

This course is for engineers and scientist involved in sensor design, sensor evaluation, and remote sensing for solving problems ranging from target detection and identification through global warming.

INSTRUCTOR

John Schroeder is the chief scientist of the Ontar Corporation. He has been involved with the development and use of atmospheric and sensor computer models and atmospheric databases for over 40 years. He has numerous publication in scientific journals and conference presentations in related areas.

Fundamentals of Electronic Image Processing

SC066

Course Level: Introductory
CEU: 0.65 $585 Members | $680 Non-Members USD
Monday 8:30 am to 5:30 pm

Many disciplines of science and manufacturing acquire and evaluate images on a routine basis. Typically these images must be processed so that important features can be measured or identified This short course introduces the fundamentals of electronic image processing to scientists and engineers who need to know how to manipulate images that have been acquired and stored within a digital computer.

LEARNING OUTCOMES

This course will enable you to:
- describe image storage, acquisition, and digitization
- become familiar with image transforms such as Fourier, Hough, Walsh, Hadamar, Discrete Cosine, and Hotelling
- explain the difference between the types of linear and non-linear filters and when to use each
- learn the difference between types of noise in the degradation of an image
- apply color image processing techniques to enhance key features in color and gray scale images
- recognize image segmentation techniques and how they are used to extract objects from an image
- explain software approaches to image processing
- demonstrate how to use the UCFImage image processing software program included with the course.

INTENDED AUDIENCE

This course will be useful to engineers and scientists who have a need to understand and use image processing techniques, but have no formal training in image processing. It will give the individual insight into a number of complex algorithms as it applies to several different applications of this very interesting and important field.

INSTRUCTOR

Arthur Weeks holds an associate professor position with the Dept. of Electrical and Computer Engineering at the Univ. of Central Florida. He recently left his position as a vice president of corporate technology to continue his research in image processing and bio-medical signal processing. He has published over 30 articles and three books in image processing.

COURSE PRICE INCLUDES the text *Fundamentals of Electronic Image Processing* (SPIE Press, 1996) by Arthur Weeks.

Defense, Homeland Security, and Law Enforcement

Applications and Performance of High Power Lasers in the Battlefield

New

SC1104

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Monday 1:30 pm to 5:30 pm

The course will provide an overview of high power lasers that can be used in the future battlefield as a part of an effective defense layer against ballistic missiles, rockets, and mortars. Various types of high power lasers, their mechanism of operation and interception, and the current technological status will be presented. We will demonstrate how a basic laser configuration can be upgraded into a high power military laser system. The advantages and disadvantages of various types of laser systems will be reviewed and future prospects of the potentially promising laser systems will be discussed.

LEARNING OUTCOMES

This course will enable you to:
- identify the various types of high power lasers that are used for military applications
- classify high power lasers according to their specific application areas and the environmental conditions in which they are best utilized
- evaluate and analyze the design considerations and performance of high power lasers
- analyze the advantages and limitations of lasers for military applications
- analyze the role of laser beams against present threats
- become familiar with the main concepts used in designing high power military lasers
- describe and estimate the operational characteristics required for effective high power laser deployment

INTENDED AUDIENCE

Laser engineers, optical engineers, laser scientists, laser system engineers, graduate students in laser physics, project officers, and anybody who wants to acquire knowledge in specific applications of high power lasers.

INSTRUCTOR

Yehoshua Kalisky is with the Chemistry Division of NRCN, Beer-Sheva, Israel. He is an SPIE Fellow, and holds several patents and numerous publications on laser physics, spectroscopy of laser materials, and various types of lasers such as gas and dye lasers, as well as diode-pumped solid state lasers.

Introduction to Night Vision

SC1068

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Thursday 1:30 pm to 5:30 pm

Night vision devices have become ubiquitous in both commercial and military environments. From the very high end systems used for aviation, to the low-performance systems sold for outdoorsmen, these devices have changed the way their users operate at night. This course explains the basic principles behind night vision and discusses the different types of night vision devices, both "analog" and "digital". In addition to a survey of night vision devices, we also examine the inner workings of night vision systems and explain them in an easy to understand manner. We will discuss the design of night vision systems, both handheld and head mounted.

Although we will talk briefly about SWIR and thermal devices to differentiate them from night vision devices, this course is primarily aimed at visible and near infra-red (NIR) imagers. Imagery from both night vision cameras as well as thermal imagers will be presented and the differences between them will be compared/contrasted.

LEARNING OUTCOMES

This course will enable you to:
- identify the three basic components of a night vision imager: the sensor, the amplifier and the output component
- specify input optics (objective lenses) and output optics (eyepieces) for both analog and digital night vision devices
- explain the difference between VIS/NIR night vision, SWIR, MWIR and LWIR sensors as well as when each should be chosen
- differentiate the different generations of night vision goggles

- define appropriate light levels for night vision device testing
- describe new digital night vision devices and their advantages and disadvantages
- explain the important attributes of night vision systems and how they should be specified for "best value" performance
- predict night vision performance using NVESD models

INTENDED AUDIENCE

Scientists, engineers, technicians, procurement personnel or managers who wish to learn more about night vision devices. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Michael Browne is the Vice President of Product Development at SA Photonics. He has a Ph.D. in Optical Engineering from the University of Arizona's Optical Sciences Center. Mike has been involved in the design, test and measurement of night vision systems since 1986. At Kaiser Electronics, he led the design of numerous head mounted night vision systems including those for the RAH-66 Comanche helicopter and the USAF NVS program. He leads SA Photonics' efforts in the design and development of person-mounted information systems, including body-worn electronics, head-mounted displays and night vision systems. His current research includes investigations into the design of wide field of view night vision devices, binocular rivalry in head mounted displays, and smear reduction in digital displays.

Design of Multiband Optical Systems

New

SC1162

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Multispectral and hyperspectral systems are designed to increase target acquisition performance as well as answer SWaP-C (size/weight/power/cost) requirements for defense and remote sensing systems. Recent developments in optical materials enable optical systems that operate over multiple infrared bands simultaneously. This course describes techniques for designing these systems using existing and new chalcoginide materials, and it provides methods for choosing material combinations, laying out systems, and predicting performance. An emphasis is placed on understanding dispersion and thermal characteristics in order to design achromatic and athermalized dual- and multi-band infrared imaging systems. Additionally, this course will touch upon recent advances in fused, layered, and gradient index infrared optics, specifically with regard to chalcoginide materials.

LEARNING OUTCOMES

This course will enable you to:
- lay out lenses using first order optical design methods
- determine a working set of optical materials based on optical and thermal characteristics
- construct glass maps for dual-band solutions
- optimize glass types using private catalog materials and optimize systems by employing user-defined merit function constraints
- describe axial and radial gradient index infrared materials and explain the advantages/disadvantages of each type

INTENDED AUDIENCE

This course is intended for optical designers and engineers wishing to expand their knowledge of infrared and multiband optics, materials, and design principles. A working understanding of optical design methods and experience with optical design software is recommended.

INSTRUCTOR

Blair Unger is Senior Optical Designer at ASE Optics. He has authored and co-authored papers and patents covering a variety of topics ranging from design of infrared chalcoginide systems to novel solar concentrators. He earned a Ph.D. in Optics at the University of Rochester, Institute of Optics. Dr. Unger is a member of both OSA and SPIE.

COURSE PRICE INCLUDES the text *Optical Design Fundamentals for Infrared Systems, Second Edition* (SPIE, 2001) by Max Riedl.

Target Detection Algorithms for Hyperspectral Imagery

SC995

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to the basic concept of automatic target and object detection and its applications in Hyperspectral Imagery (HSI). The primary goal of this course is to introduce the well known target detection algorithms in hyperspectral imagery. Examples of the classical target detection techniques such as spectral matched filter, subspace matched filter, adaptive matched filter, orthogonal subspace, support vector machine (SVM) and machine learning are reviewed. Construction of invariance subspaces for target and background as well as the use of regularization techniques are presented. Standard atmospheric correction and compensation techniques are reviewed. Anomaly detection techniques for HSI and dual band FLIR imagery are also discussed. Applications of HSI for detection of mines, targets, humans, chemical plumes and anomalies are reviewed.

LEARNING OUTCOMES

This course will enable you to:
- describe the fundamental concepts of target detection algorithms as applied to HSI
- learn the procedure to use the generalized maximum likelihood ratio test to design spectral detectors
- describe the fundamental differences between different detection algorithms based on their model representations
- develop statistical models as well as subspace models for HSI data
- explain the difference between anomaly detection and classification
- distinguish between linear and nonlinear approaches (SVM and Kernel learning techniques)
- develop anomaly detection techniques for different environmental scenarios
- describe linear models and unmixing techniques for abundance measures
- plot ROC curves to evaluate the performance of the algorithms

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about target detection in hyperspectral, multispectral or dual-band FLIR imagery. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Nasser Nasrabadi is a senior research scientist (ST) at US Army Research Laboratory (ARL). He is also an adjunct professor in the Electrical and Computer Engineering Department at the Johns Hopkins University. He is actively engaged in research in image processing, neural networks, automatic target recognition, and video compression and its transmission over high speed networks. He has published over 200 papers in journals and conference proceedings. He has been an associate editor for the IEEE Transactions on Image Processing,IEEE Transactions on Circuits and Systems for Video Technology and IEEE Transactions for Neural Networks. He is a Fellow of IEEE and SPIE.

Predicting Target Acquisition Performance of Electro-Optical Imagers

SC181

Course Level: Advanced
CEU: 0.65 $570 Members | $665 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course describes how to predict and evaluate electro-optical (EO) imager performance. Metrics that quantify imager resolution are described. The detection, recognition, and identification tasks are discussed, and the meaning of acquisition probabilities is explained. The basic theory of operation of thermal imagers, image intensifiers, and video cameras is presented. This course describes how to quantify the resolution and noise characteristics of an EO imager. The theory and analysis of sampled imagers is emphasized. Image quality metrics are described, and the relationship between image quality and target acquisition performance is explained. The course provides a complete overview of how to analyze and evaluate the performance of EO imagers.

LEARNING OUTCOMES

This course will enable you to:
- describe what a target acquisition model does
- describe the operation of thermal sensors, video cameras and other EO imagers
- analyze the impact of sampling on targeting performance
- evaluate the targeting performance of an EO imager

INTENDED AUDIENCE

This course is intended for the design engineer or system analyst who is interested in quantifying the performance of EO imagers. Some background in linear systems analysis is helpful but not mandatory.

INSTRUCTOR

Richard Vollmerhausen started his engineering career in 1965 at Douglas Aircraft; he worked instrumentation on the S-IVB Stage of the Saturn Apollo. After two years in the army, he moved to the Naval Weapon Center at China Lake and designed infrared trackers for air-to-air missiles. In the early 1980's, he joined the army's Night Vision lab and became head of the branch developing targeting and pilotage systems for army aviation. In the late 1990's, he headed the Model Development Branch at NVL and developed the target acquisition models currently used by the army. After retirement in 2003, he consulted for government and industry. In 2011, he started graduate studies University of Delaware, receiving his PhD in EE in 2013. Dr. Vollmerhausen is currently Chief Engineer and a founding partner of St. Johns Optical Systems in Lake Mary, Florida.

COURSE PRICE INCLUDES the text *Analysis and Evaluation of Sampled Imaging Systems* (SPIE Press, 2010) by Richard H. Vollmerhausen, Ronald G. Driggers, and Don Reago.

Introduction to Electro-Optical Systems Design

SC1112

Course Level: Intermediate
CEU: 0.65 $580 Members | $675 Non-Members USD
Wednesday 8:30 am to 5:30 pm

Using communication theory, this full-day course explains the universal principles underlying a diverse range of electro-optical systems. From visible / infra-red imaging, to free space optical communications and laser remote sensing, the course relates key concepts in science and systems engineering to practical systems issues. To provide realistic understanding of the concepts presented, many real-world examples are included.

This course summarizes laser propagation fundamentals, coherent and incoherent optical system characterization, the effects of optical turbulence and particulate scattering on propagating laser beams, atmospheric and submarine laser communication systems concepts, and laser radar and optical imaging basics. Also included are discussions of adaptive optics, adaptive image processing, statistical hypothesis testing, and their effect on system performance.

LEARNING OUTCOMES

This course will enable you to:
- perform Fourier and Geometric Optics Analyses of electro-optical systems
- estimate detector noise statistics, detector performance, and signal-to-noise ratio
- perform first order image processing, including statistical image enhancements of incoherent images
- calculate contrast, irradiance and radiance created by the propagation of light in particulate environments
- calculate the system link budgets for laser systems, including synthetic aperture ladar
- perform statistical hypothesis testing, which includes how to calculate logarithmic likelihood ratio tests, test statistics, and probabilities of false alarm and detection
- assess and understand real-world Adaptive Optical system performance

INTENDED AUDIENCE

This course is intended for scientists, technical managers and design engineers who are interested in understanding first-order electro-optical system design and the effects that limit system performance.

INSTRUCTOR

Larry Stotts is a consultant and was the Deputy Office Director in the Strategic Technology Office of the Defense Advanced Research Projects Agency. He earned his Ph.D. in Electrical Engineering (Communications Systems) at the University of California at San Diego. He has published over 102 technical reports and journal articles and 2 co-authored books. Recognition of his work includes a Department of Defense Medal for Distinguished Civilian Service; two Secretary of Defense Medal for Meritorious Civilian Service Awards; two DARPA Technical Achievement Awards; The Technical Cooperation Program Technical Achievement Award, and the Naval Ocean Systems Center Technical Director's Award. Dr. Stotts is a Life Fellow of the SPIE, Fellow of the IEEE and a Senior Member and Fellow of OSA.

COURSE PRICE INCLUDES the text *Fundamentals of Electro-Optic Systems Design: Communications, Lidar and Imaging* by S. Karp and L. B. Stotts (Cambridge Press, 2013).

Multispectral Image Fusion and Night Vision Colorization

SC1135

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Thursday 8:30 am to 12:30 pm

This course presents methods and applications of multispectral image fusion and night vision colorization organized into three areas (1) image fusion methods, (2) evaluation, and (3) applications. Two primary multiscale fusion approaches, image pyramid and wavelet transform, will be emphasized. Image fusion comparisons include data, metrics, and analytics.

Fusion applications presented include off-focal images, medical images, night vision, and face recognition. Examples will be discussed of night-vision images rendered using channel-based color fusion, lookup-table color mapping, and segment-based method colorization. These images resemble natural color scenes and thus can improve the observer's performance. After taking this course you will know how to combine multiband images and how to render the result with colors in order to enhance computer vision and human vision.

In addition to the course notes, attendees will receive a set of published papers, the data sets used in the analysis, and MATLAB code of methods and metrics for evaluation. A FTP website is established for course resource access.

LEARNING OUTCOMES

This course will enable you to:

- review the applications and techniques of image fusion and night vision enhancement
- categorize multiscale image fusion methods : image pyramid vs. wavelet transform
- apply quantitative vs. qualitative evaluation
- investigate advanced fusion applications: color fusion and face recognition
- obtain an overview of colorization methods: color mapping, segment-based, channel-based
- evaluate colorized images: qualitative vs. quantitative, and links to the NIIRS (National Imagery Interpretability Rating Scale) ratings
- explore information fusion application to a multispectral stereo face recognition system at four levels: image, feature, score, and decision; qualitatively evaluate performance improvement
- recognize and discuss challenges for future development and applications

INTENDED AUDIENCE

Scientists, engineers, practitioners, students, and researchers who wish to learn more about how to combine multiband images to enhance computer vision and human vision as well as face recognition. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Yufeng Zheng received his PhD in optical engineering/image processing from the Tianjin University in Tianjin, China, in 1997. He is currently an associate professor at Alcorn State University in Lorman, Mississippi. He is the principle investigator of three federal research grants in night vision enhancement, and in multispectral face recognition. He holds two patents in glaucoma classification and face recognition, and has published more than 70 peer-reviewed papers. His research interests include pattern recognition, biometrics, information fusion, and computer-aided diagnosis. He is a Cisco Certified Network Professional (CCNP), and a senior member of SPIE, and IEEE Computer Society & Signal Processing.

Erik Blasch received his B.S. in mechanical engineering from the Massachusetts Institute of Technology in 1992 and M.S. degrees in mechanical engineering, health science, and industrial engineering (human factors) from Georgia Tech. He completed an M.B.A., M.S.E.E., M.S. econ, M.S./Ph.D. psychology (ABD), and a Ph.D. in electrical engineering from Wright State University and is a graduate of Air War College. From 2000-2010, Dr. Blasch was the information fusion evaluation tech lead for the Air Force Research Laboratory (AFRL) Sensors Directorate—COMprehensive Performance Assessment of Sensor Exploitation (COMPASE) Center, and adjunct professor with Wright State University. From 2010-2012, Dr. Blasch was an exchange scientist to Defence R&D Canada at Valcartier, Quebec in the Future Command and Control (C2) Concepts group. He is currently with the AFRL Information Directorate supporting information fusion evaluation. He received the 2009 IEEE Russ Bioengineering Award and compiled over 30 top ten finishes as part of robotic teams in international contests. He is a past President of the International Society of Information Fusion (ISIF), a member of the IEEE Aerospace and Electronics Systems Society (AESS) Board of Governors, and a SPIE Fellow. His research interests include target tracking, information/sensor/image fusion, pattern recognition, and biologically-inspired applications.

Introduction to Optical and Infrared Sensor Systems

SC789

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to optical (near UV-visible) and

infrared sensor systems, with an emphasis on systems used in defense and security. Topics include both passive imagers and active laser radars (lidar/ladar). We begin with a discussion of radiometry and radiometric calculations to determine how much optical power is captured by a sensor system. We survey atmospheric propagation and phenomenology (absorption, emission, scattering, and turbulence) and explore how these issues affect sensor systems. Finally, we perform signal calculations that consider the source, the atmosphere, and the optical system and detector, to arrive at a signal-to-noise ratio for typical passive and active sensor systems. These principles of optical radiometry, atmospheric propagation, and optical detection are combined in examples of real sensors studied at the block-diagram level. Sensor system examples include passive infrared imagers, polarization imagers, and hyperspectral imaging spectrometers, and active laser radars (lidars or ladars) for sensing distributed or hard targets. The course organization is approximately one third on the radiometric analysis of sensor systems, one third on atmospheric phenomenology and detector parameters, and one third on example calculations and examination of sensor systems at the block-diagram level.

LEARNING OUTCOMES

This course will enable you to:

- explain and use radiometry for describing and calculating the flow of optical energy in an optical or infrared sensor system
- determine the radiometric throughput of sensor systems
- describe atmospheric phenomenology relevant to propagation of optical and infrared radiation
- explain how the atmosphere affects the performance of sensor systems
- use detector parameters with radiometric calculations to predict the signal received by passive and active sensors
- calculate signal-to-noise ratio for typical sensor systems
- explain real-world sensor systems at the block-diagram level
- explain the difference between and important concepts of passive reflection-based and emission-based imaging
- describe the basic operating principles of passive imagers and active laser radar (lidar/ladar) systems for distributed and solid target sensing

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who find themselves working on (or curious about) optical (uv-vis) and infrared sensor systems without formal training in this area. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Joseph Shaw has been developing optical remote sensing systems and using them in environmental and military sensing for two decades, first at NOAA and currently as professor of electrical engineering and physics at Montana State University. Recognition for his work in this field includes NOAA research awards, a Presidential Early Career Award for Scientists and Engineers, and the World Meteorological Organization's Vaisala Prize. He earned a Ph.D. in Optical Sciences at the University of Arizona. Dr. Shaw is a Fellow of both the OSA and SPIE.

Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation

SC1137

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Passive and active sensors are developed for target acquisition and spectroscopic analysis ranging from the ultraviolet through the microwave region. Accurate atmospheric absorption and emission (path radiance) values are essential for sensor development. This data is obtained using MODTRAN, often used in conjunction with NVThermIP, and other sensor software. HITRAN and FASCODE are used for laser applications.

Emphasis will be placed on solving real world problems. Four typical scenarios will be presented: ground-to-ground, ground-to-air, air-to- air and ground-to-space scenarios. The importance of transmission and radiance for each scenario will be discussed.

The students are encouraged to bring their specific scenarios to the course to be setup and run. A computer will be available and we will run these scenarios and discuss the results. The attendees will be able to take home model input files to be used at their facilities. We will discuss their cases along with the expected transmission and atmospheric radiance values.

LEARNING OUTCOMES

This course will enable you to:

- present an overview and explain the “theory” of the models: emphasis on MODTRAN
- apply the models to atmospheric transmission/radiance, smart weapons for defense applications, EO sensors development/ evaluations, ground and satellite image correction, hyperspectral imaging, laser spectroscopy laser communications and LIDAR/ LADAR systems.
- evaluate a “basic” problem: You are on the ground looking up to an aircraft. Your partner is on the aircraft looking down at the ground. Do you and your partner measure the same atmospheric transmission? Do you and your partner measure the same radiance? Why?
- identify MODTRAN assumptions, capabilities and limitations
- define basic model inputs – i.e. “MODTRAN for Dummies”
- utilize advanced model inputs such as radiosonde data, Lambertian surfaces, BRDF etc.
- solve and run your own specific scenarios
- compare other models and databases: FASCODE, EOSAEL, HITRAN, NVThermIP etc.

INTENDED AUDIENCE

This course is for engineers and scientist involved in sensor design, sensor evaluation, and remote sensing for solving problems ranging from target detection and identification through global warming.

INSTRUCTOR

John Schroeder is the chief scientist of the Ontar Corporation. He has been involved with the development and use of atmospheric and sensor computer models and atmospheric databases for over 40 years. He has numerous publication in scientific journals and conference presentations in related areas.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:

- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Qian (Jenny) Du has been conducting research on hyperspectral image processing and analysis for more than fifteen years. She has numerous peer-reviewed publications in this field, and developed several well-received algorithms. She currently is Bobby Shackouls Professor in the Department of Electrical and Computer Engineering at Mississippi State University. Dr. Du was a selected lecturer for IEEE Geoscience and Remote Sensing Symposium in 2009-2013, and a selected lecturer for the 5th IEEE GRSS Workshop on Hyperspectral Signal and Image Processing: Evolution in Remote Sensing (WHISPERS). She is an Associate Editor for IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing, IEEE Signal Processing Letters, and SPIE Journal of Applied Remote Sensing.

Electro-Optical Imaging System Performance

SC154

Course Level: Intermediate
CEU: 0.65 $600 Members | $695 Non-Members USD
Thursday 8:30 am to 5:30 pm

While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). System analysis could be performed in the spatial domain. However, it is far easier to work in the frequency domain using MTFs. Subsystem MTFs are combined for overall system analysis. This is often called image chain modeling. Although the math is sometimes complex, the equations are graphed for easy understanding. With the Sept 2002 models (e.g., NVTherm), the minimum resolvable temperature (MRT) and minimum resolvable contrast (MRC) are coupled with the target signature and atmospheric transmittance to provide range performance predictions (target acquisition modeling). Three ranges are predicted: detection, recognition, and identification (often shorten to DRI). DRI ranges depend upon the subsystem MTFs, noise (primarily random and fixed pattern noise), the display, and the eye's response. The two-dimensional (fictitious) spatial frequency approach, three-dimensional noise model, and target discrimination metrics (Johnson's N50) are applied to performance predictions. The 2007 models (e.g., NVThermIP) employ contrast rather than MRT (MRC) for target acquisition and use V50 as a discrimination metric. Limitations and applications of NVTherm and NVThermIP are discussed with a brief demonstration of the models. Selection and optimization of a specific sensor depends upon a myriad of radiometric, spectral, and spatial parameters (e.g., target signature, atmospheric conditions, optics f-number, field-of-view, and detector responsivity). MTFs and their effect on imagery are interactively demonstrated. Spatial sampling is present in all cameras. Super-resolution reconstruction and microscan minimize sampling artifacts. Several optimization examples are discussed (case study examples).

LEARNING OUTCOMES

This course will enable you to:

- use the correct MTFs for image chain analysis
- describe the radiometric relationship between delta-T and spectral radiance
- compare the differences among scanning, staring, and microscan staring array performance
- recognize the limitations of back-of-the-envelope approximations such as resolution and sensitivity
- identify the subsystem (e.g., motion, optics, detector, electronics, and display) that limits performance
- appreciate limitations of range performance predictions (target acquisition predictions)
- determine if mid-wave (MWIR) or long-wave (LWIR) infrared is appropriate for your application
- appreciate the value of graphs rather than a table of numbers
- be conversant with the myriad of technological terms
- become a smart buyer, analyst, and/or user of imaging systems

INTENDED AUDIENCE

This course is intended for engineers, managers, and buyers who want to understand the wealth of information available from imaging system end-to-end analysis. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Electro-Optical Imaging System Performance, Fifth Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Testing and Evaluation of E-O Imaging Systems

SC067

Course Level: Advanced
CEU: 0.65 $595 Members | $690 Non-Members USD
Friday 8:30 am to 5:30 pm

This course describes all the quantitative and qualitative metrics that are used to characterize imaging system performance. While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). Data analysis techniques are independent of the sensor selected (i.e., wavelength independent). The difference lies in the input variable name (watts, lumens, or delta-T) and the output variable name (volts, lumens, or observer response). Slightly different test methodologies are used for visible and thermal imaging systems. Performance parameters discussed include resolution, responsivity, aperiodic transfer function, slit response function, random noise, uniformity, fixed pattern noise, modulation transfer function (MTF), contrast transfer function (CTF), minimum resolvable temperature (MRT), and the minimum resolvable contrast (MRC). The eye's spatial and temporal integration allows perception of images whose signal-to-noise ratio (SNR) is less than unity. Since all imaging system spatially sample the scene, sampling artifacts occur in all imagery and therefore affects all measurements. Sampling can significantly affect MRT and MTF tests. Low SNR and sampling effects are interactively demonstrated. This course describes the most common testing techniques. Equally important is identifying those parameters that adversely affect results.

LEARNING OUTCOMES

This course will enable you to:

- write concise test procedures with unambiguous system specifications
- identify all appropriate test parameters
- describe the radiometric relationship between delta-T and spectral radiance
- differentiate between observer variability and system response during MRC and MRT testing
- describe the difference between the CTF and the MTF
- learn about the latest MTF measurement techniques
- discern the difference between poor system performance, peculiarities of the system under test, and measurement errors
- assess how sampling affects test results
- appreciate the benefits and short comings of fully automated testing
- identify parameters that can lead to poor results.
- learn about evolving standardized testing concepts

INTENDED AUDIENCE

The course is for managers, specification writers, and test engineers involved with all phases of imaging system characterization ranging from satisfying customer requirements to ensuring that specifications are unambiguous and testable.

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Testing and Evaluation of Infrared Imaging Systems, Third Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Radiometry and its Practical Applications

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:
- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Ms. Grant has taught radiometry and allied subjects for SPIE and other educational, governmental, and corporate organizations since 2009. Her consultancy, Lines and Lights Technology, has been in business since 1994 and she has addressed radiometric and systems problems throughout the spectrum from UV to IR.

COURSE PRICE INCLUDES the texts *The Art of Radiometry* (SPIE Press, 2009) by James M. Palmer and Barbara G. Grant, and the *Field Guide to Radiometry* (SPIE Press, 2011) by Barbara G. Grant .

Basic Laser Technology

SC972

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Friday 8:30 am to 12:30 pm

If you are uncomfortable working with lasers as "black boxes" and would like to have a basic understanding of their inner workings, this introductory course will be of benefit to you. The workshop will cover the basic principles common to the operation of any laser/laser system. Next, we will discuss laser components and their functionality. Components covered will include laser pumps/energy sources, mirrors, active media, nonlinear crystals, and Q-switches. The properties of laser beams will be described in terms of some of their common performance specifications such as longitudinal modes and monochromaticity, transverse electromagnetic (TEM) modes and focusability, continuous wave (CW) power, peak power and power stability. Laser slope and wall-plug efficiencies will also be discussed.

LEARNING OUTCOMES

This course will enable you to:
- describe the overall inner workings of any laser
- describe the functionality of the key laser components
- know the difference between how acousto- and electro-optic Q-switches work
- explain how each key component in a laser may contribute to laser performance
- intelligently engage your clients or customers using proper laser terminology
- build stronger relationships with clients and customers by demonstrating product knowledge
- obtain the technical knowledge and confidence to enhance your job performance and rise above the competition, inside and outside your company

INTENDED AUDIENCE

Managers, engineers, technicians, assemblers, sales/marketing, customer service, and other support staff. This short course will help cultivate a common/standardized understanding of lasers across the company.

INSTRUCTOR

Sydney Sukuta is currently a Laser Technology professor at San Jose City College. He also has industry experience working for the some the world's leading laser manufacturers in Silicon Valley where he saw first-hand the issues they encounter on a daily basis. In response, Dr. Sukuta developed prescriptive short courses to help absolve most of these issues.

Sensing for Industry, Environment, and Health

Introduction to Optical and Infrared Sensor Systems

SC789

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to optical (near UV-visible) and infrared sensor systems, with an emphasis on systems used in defense and security. Topics include both passive imagers and active laser radars (lidar/ladar). We begin with a discussion of radiometry and radiometric calculations to determine how much optical power is captured by a sensor system. We survey atmospheric propagation and phenomenology (absorption, emission, scattering, and turbulence) and explore how these issues affect sensor systems. Finally, we perform signal calculations that consider the source, the atmosphere, and the optical system and detector, to arrive at a signal-to-noise ratio for typical passive and active sensor systems. These principles of optical radiometry, atmospheric propagation, and optical detection are combined in examples of real sensors studied at the block-diagram level. Sensor system examples include passive infrared imagers, polarization imagers, and hyperspectral imaging spectrometers, and active laser radars (lidars or ladars) for sensing distributed or hard targets. The course organization is approximately one third on the radiometric analysis of sensor systems, one third on atmospheric phenomenology and detector parameters, and one third on example calculations and examination of sensor systems at the block-diagram level.

LEARNING OUTCOMES

This course will enable you to:
- explain and use radiometry for describing and calculating the flow of optical energy in an optical or infrared sensor system
- determine the radiometric throughput of sensor systems
- describe atmospheric phenomenology relevant to propagation of optical and infrared radiation
- explain how the atmosphere affects the performance of sensor systems
- use detector parameters with radiometric calculations to predict the signal received by passive and active sensors
- calculate signal-to-noise ratio for typical sensor systems
- explain real-world sensor systems at the block-diagram level
- explain the difference between and important concepts of passive reflection-based and emission-based imaging
- describe the basic operating principles of passive imagers and active laser radar (lidar/ladar) systems for distributed and solid target sensing

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who find themselves working on (or curious about) optical (uv-vis) and infrared sensor systems without formal training in this area. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Joseph Shaw has been developing optical remote sensing systems and using them in environmental and military sensing for two decades, first at NOAA and currently as professor of electrical engineering and physics at Montana State University. Recognition for his work in this field includes NOAA research awards, a Presidential Early Career Award for Scientists and Engineers, and the World Meteorological Organization's Vaisala Prize. He earned a Ph.D. in Optical Sciences at the University of Arizona. Dr. Shaw is a Fellow of both the OSA and SPIE.

Fundamentals of Fiber Optic Sensor Design and Technology

New

SC1160

Course Level: Introductory
CEU: 0.65 $545 Members | $640 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course explains basic principles and applications of fiber optic sensor technology. A primary goal of the course is to present the underlying principals associated with the design and application of fiber optic sensor technology.

The course begins with an overview of the fundamental components associated with fiber optic sensors and how they interact to form intensity-based and interferometry-based fiber sensors. It then continues with an overview of physical fiber optic sensors starting with intensity-based sensors and continuing with those based on the Mach-Zehnder, Michelson and Sagnac interferometers. A review of fiber gratings and fiber-etalon-based sensors follows. Examples of applications are given in a wide variety of fields including aerospace and defense, civil structures, oil and gas, and composite manufacturing.

The course continues with an examination of the important emerging areas of chemical and biological fiber sensors – including spectroscopic, refractometric, and more exotic types. Applications ranging from biomedical diagnosis to environmental monitoring will be discussed.

Anyone seeking a rapid and effective introduction to the field of fiber optic sensor technology would benefit greatly from this course. It is intended to strongly complement and serve as an introduction to the *Fiber Optic Sensors and Applications Conference* associated with this Symposium.

LEARNING OUTCOMES

This course will enable you to:
- describe the fundamental components associated with most fiber optic sensors
- explain how components interact and how the performance of a fiber sensor depends on these interactions
- identify common intensity-based fiber sensors, their application areas, their advantages and limitations
- compare the relative advantages of different sensor classes (e.g., intrinsic vs. extrinsic, single-point vs. distributed; active vs. passive) and readout techniques (e.g., wavelength vs. intensity, direct vs. modulated, homodyne vs. heterodyne)
- explain the operation of the Mach-Zehnder, Michelson and Sagnac interferometers and how they are being applied in the field
- determine the strain and temperature response of fiber grating sensors
- describe how fiber grating sensors may be used to supported multi-parameter sensing, including pressure and temperature and multi-axis strain
- understand the operation and applications of evanescent-field, optrode-style, and remote-spectroscopic sensors
- explain the application and operation of fiber-etalon-based sensors
- identify classes of chemical and biological fiber sensors
- be familiar with applications of fiber sensors in medical, chemical, environmental, aerospace, defense, oil and gas, civil structure and manufacturing applications

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to design and apply fiber optic sensors to a wide range of applications. Undergraduate training in engineering or science would be of great benefit.

INSTRUCTOR

Eric Udd has been designing and developing fiber optic sensor technology since 1977, at McDonnell Douglas, Blue Road Research and as President of Columbia Gorge Research since January 2006. He has made fundamental contributions to fiber optic rotation, acoustic, pressure, strain, temperature, and moisture sensors. Mr. Udd has 48 issued patents on fiber optic technology and approximately 170 papers. He is a McDonnell Douglas, SPIE and OSA Fellow and in 2009 was awarded the Richardson Medal by OSA for this work in Fiber Optic Sensors and the field of Fiber Optic Smart Structures.

Robert Lieberman has most recently been the President and Chief Technology Officer of Intelligent Optical Systems, Inc., and serves or has served on the Boards of SPIE, Optech, OptiSense LLC, and Optical Security Sensing LLC. Dr. Lieberman's background includes a Ph.D. in physics from the University of Michigan, and a scientific and technical management career at AT&T Bell Laboratories and Physical Optics Corporation notable for inventions and ground-breaking research projects in microelectronic devices, optical biosensors, physical and chemical sensors, and sensor networks. Dr. Lieberman has written over 50 publications, holds 21 U.S. patents, has chaired numerous conferences on optical sensing, and is a Fellow of SPIE.

COURSE PRICE INCLUDES the text *Fiber Optic Sensor Field Guide* (SPIE Press, 2015), by William B. Spillman and Eric Udd.

Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation

SC1137

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Passive and active sensors are developed for target acquisition and spectroscopic analysis ranging from the ultraviolet through the microwave region. Accurate atmospheric absorption and emission (path radiance) values are essential for sensor development. This data is obtained using MODTRAN, often used in conjunction with NVThermIP, and other sensor software. HITRAN and FASCODE are used for laser applications.

Emphasis will be placed on solving real world problems. Four typical scenarios will be presented: ground-to-ground, ground-to-air, air-to- air and ground-to-space scenarios. The importance of transmission and radiance for each scenario will be discussed.

The students are encouraged to bring their specific scenarios to the course to be setup and run. A computer will be available and we will run these scenarios and discuss the results. The attendees will be able to take home model input files to be used at their facilities. We will discuss their cases along with the expected transmission and atmospheric radiance values.

LEARNING OUTCOMES

This course will enable you to:
- present an overview and explain the "theory" of the models: emphasis on MODTRAN
- apply the models to atmospheric transmission/radiance, smart weapons for defense applications, EO sensors development/ evaluations, ground and satellite image correction, hyperspectral imaging, laser spectroscopy laser communications and LIDAR/ LADAR systems.
- evaluate a "basic" problem: You are on the ground looking up to an aircraft. Your partner is on the aircraft looking down at the ground. Do you and your partner measure the same atmospheric transmission? Do you and your partner measure the same radiance? Why?
- identify MODTRAN assumptions, capabilities and limitations
- define basic model inputs – i.e. "MODTRAN for Dummies"
- utilize advanced model inputs such as radiosonde data, Lambertian surfaces, BRDF etc.
- solve and run your own specific scenarios
- compare other models and databases: FASCODE, EOSAEL, HITRAN, NVThermIP etc.

INTENDED AUDIENCE

This course is for engineers and scientist involved in sensor design, sensor evaluation, and remote sensing for solving problems ranging from target detection and identification through global warming.

INSTRUCTOR

Statistics for Imaging and Sensor Data

SC1072

Course Level: Introductory
CEU: 0.65 $575 Members | $670 Non-Members USD
Monday 8:30 am to 5:30 pm

The purpose of this course is to survey fundamental statistical methods in the context of imaging and sensing applications. You will learn the tools and how to apply them correctly in a given context. The instructor will clarify many misconceptions associated with using statistical methods. The course is full of practical and useful examples of analyses of imaging data. Intuitive and geometric understanding of the introduced concepts will be emphasized. The topics covered include hypothesis testing, confidence intervals, regression methods, and statistical signal processing (and its relationship to linear models). We will also discuss outlier detection, the method of Monte Carlo simulations, and bootstrap.

LEARNING OUTCOMES

- apply the statistical methods suitable for a given context
- demonstrate the statistical significance of your results based on hypothesis testing
- construct confidence intervals for a variety of imaging applications
- fit predictive equations to your imaging data
- construct confidence and prediction intervals for a response variable as a function of predictors
- explain the basics of statistical signal processing and its relationship to linear regression models
- perform correct analysis of outliers in data
- implement the methodology of Monte Carlo simulations

INTENDED AUDIENCE

This course is intended for participants who need to incorporate fundamental statistical methods in their work with imaging data. Participants are expected to have some experience with analyzing data.

INSTRUCTOR

Peter Bajorski is Professor of Statistics and Graduate Program Chair at the Rochester Institute of Technology. He teaches graduate and undergraduate courses in statistics including a course on Multivariate Statistics for Imaging Science. He also designs and teaches short courses in industry, with longer-term follow-up and consulting. He performs research in statistics and in hyperspectral imaging. Dr. Bajorski wrote a book on Statistics for Imaging, Optics, and Photonics published in a prestigious Wiley Series in Probability and Statistics. He is a senior member of SPIE and IEEE.

COURSE PRICE INCLUDES the text *Statistics for Imaging, Optics, and Photonics* (Wiley, 2011) by Peter Bajorski.

Radiometry and its Practical Applications

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:
- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Infrared Radiometric Calibration

SC1109

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

This course describes the radiometric calibration techniques used for SI-traceable measurements of sources, detectors and material properties in the infrared wavelength region. The main goal is to enable understanding of infrared measurements with quantified uncertainties so that full uncertainty budgets can be established for the final quantities. Examples from NIST calibrations of sources, detectors and materials will be described.

The properties and measurements of various different blackbody and lamp sources will be discussed. Detector calibrations using both thermal and quantum detectors with monochromators and Fourier-transform spectrometers will be covered. Also, infrared reflectance measurements using Fourier-transform spectrometers will be explained. Examples of NIST-developed infrared transfer and working standard radiometers in field deployments will be utilized to illustrate the above concepts.

LEARNING OUTCOMES

This course will enable you to:

- choose the optimal sources for the measurement needs from the different sources available in the field
- list the procedures for selecting and calibrating infrared detectors and their associated uncertainties
- describe the uncertainty propagation principles in both source and detector calibrations
- utilize techniques for infrared material reflectance measurements and their uncertainty propagation
- characterize a radiation thermometer according to ASTM standards

INTENDED AUDIENCE

This course is designed for technical staff involved in radiometric calibrations of sources, detectors and radiometers.

INSTRUCTOR

Howard Yoon graduated with a B.S. Physics and Chemistry degree from Swarthmore College and earned his M.S. and Ph.D. Physics degrees from the University of Illinois at Urbana-Champaign. He has worked for Bell Communications Research and Dartmouth College. He currently serves as the US Representative to the Consultative Committee on Thermometry and is a member of the IEC TC65/SC65B/WG5 committee. While at NIST, he has received the Allen V. Astin Award and the DOC Silver Award. Currently at NIST he is a physicist working on several projects related to advancing spectroradiometry for improvements in fundamental and disseminated standards of spectral radiance, spectral irradiance, and radiance temperature.

George Eppeldauer received his M.E. and Ph.D. Electronics Engineering degrees from the Technical University of Budapest. Previously, he has worked at the Research Institute for Technical Physics at the Hungarian Academy of Sciences. He won the Best Paper Award at the NCSLI Conference in 2004, and he chairs the CIE TC2-48 Technical Committee (TC) on Spectral Responsivity Calibrations and the CIE TC2-29 TC on Detector Linearity. He is an electronics engineer with research areas in detector metrology developing transfer and working standard optical radiometers, photometers, and colorimeters and realizing detector responsivity based scales. The standards he has developed have been utilized to improve the two NIST SI units, the candela and kelvin, the illuminance responsivity scale, the tristimulus color scale, the spectral power, irradiance, and radiance responsivity reference-scales, and the spectral irradiance scale. He was one of the three pioneers who developed the SIRCUS reference responsivity-calibration facility.

Simon Kaplan received a B.A. Physics degree from Oberlin College and Ph.D. Physics degree from Cornell University. Prior to joining NIST, he has worked at the University of Maryland, College Park. He is a physicist with research interests in spectrophotometry and radiometry. He has worked on the characterization of optical materials and components in support of UV photolithography and infrared remote sensing applications. Currently he is leading the Low Background Infrared (LBIR) facility for absolute detector-based irradiance and radiance calibrations in support of missile defense as well as climate monitoring technology.

Charles Gibson is a Physicist in the Sensor Science Division at the National Institute of Standards and Technology. He earned his B.A. degree in Physics at Fisk University. His career at NIST began in 1986 where his research has focused on the measurement of ultraviolet, visible, and near infrared radiation sources. He realizes the NIST national scales and provides calibration services for spectral radiance, spectral irradiance, temperature, and heat flux. Mr. Gibson is active in several international committees for optical radiation measurement. He is a member of ASTM E20 Committee on Temperature Measurement and the ASTM E21.08 Subcommittee on Thermal Protection. He is a group-recipient of the 2008 Department of Commerce Silver Medal Award for Scientific/Engineering Achievement for advancing ultraviolet radiation measurement science for applications in materials processing, semiconductor manufacturing, and space sciences. He is also a co-recipient of the 2005 NIST Allen V. Astin Measurement Science Award for major advances in the realization and dissemination of the NIST spectral irradiance scale widely used in climate-change research.

This course has been designed to complement and build upon the content presented in SC1073, Radiometry and its Practical Applications. Attendees will benefit maximally from attending both courses.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:
- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Qian (Jenny) Du has been conducting research on hyperspectral image processing and analysis for more than fifteen years. She has numerous peer-reviewed publications in this field, and developed several well-received algorithms. She currently is Bobby Shackouls Professor in the Department of Electrical and Computer Engineering at Mississippi State University. Dr. Du was a selected lecturer for IEEE Geoscience and Remote Sensing Symposium in 2009-2013, and a selected lecturer for the 5th IEEE GRSS Workshop on Hyperspectral Signal and Image Processing: Evolution in Remote Sensing (WHISPERS). She is an Associate Editor for IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing, IEEE Signal Processing Letters, and SPIE Journal of Applied Remote Sensing.

Target Detection Algorithms for Hyperspectral Imagery

SC995

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Thursday 8:30 am to 5:30 pm

This course provides a broad introduction to the basic concept of automatic target and object detection and its applications in Hyperspectral Imagery (HSI). The primary goal of this course is to introduce the well known target detection algorithms in hyperspectral imagery. Examples of the classical target detection techniques such as spectral matched filter, subspace matched filter, adaptive matched filter, orthogonal subspace, support vector machine (SVM) and machine learning are reviewed. Construction of invariance subspaces for target and background as well as the use of regularization techniques are presented. Standard atmospheric correction and compensation techniques are reviewed. Anomaly detection techniques for HSI and dual band FLIR imagery are also discussed. Applications of HSI for detection of mines, targets, humans, chemical plumes and anomalies are reviewed.

LEARNING OUTCOMES

This course will enable you to:
- describe the fundamental concepts of target detection algorithms as applied to HSI
- learn the procedure to use the generalized maximum likelihood ratio test to design spectral detectors
- describe the fundamental differences between different detection algorithms based on their model representations
- develop statistical models as well as subspace models for HSI data
- explain the difference between anomaly detection and classification
- distinguish between linear and nonlinear approaches (SVM and Kernel learning techniques)
- develop anomaly detection techniques for different environmental scenarios
- describe linear models and unmixing techniques for abundance measures
- plot ROC curves to evaluate the performance of the algorithms

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about target detection in hyperspectral, multispectral or dual-band FLIR imagery. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Nasser Nasrabadi is a senior research scientist (ST) at US Army Research Laboratory (ARL). He is also an adjunct professor in the Electrical and Computer Engineering Department at the Johns Hopkins University. He is actively engaged in research in image processing, neural networks, automatic target recognition, and video compression and its transmission over high speed networks. He has published over 200 papers in journals and conference proceedings. He has been an associate editor for the IEEE Transactions on Image Processing,IEEE Transactions on Circuits and Systems for Video Technology and IEEE Transactions for Neural Networks. He is a Fellow of IEEE and SPIE.

Infrared Optical Materials, Fabrication and Testing for the Optical Engineer

SC1136

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Tuesday 1:30 pm to 5:30 pm

This course is designed to give the optical engineer or lens designer an introduction to the technologies and techniques of infrared optical materials, fabrication and testing. This knowledge will help the optical engineer understand which optical specifications/tolerances lead to more cost effective optical components. Topics covered include infrared optical materials, traditional, CNC and novel optical fabrication technologies, surface testing and fabrication tolerances.

LEARNING OUTCOMES

This course will enable you to:
- identify key mechanical, chemical and thermal properties of infrared optical materials (glass, crystals and ceramics) and how they affect the optical system performance and cost of optical components
- review the basics of optical fabrication
- define meaningful surface tolerances
- communicate with optical fabricators
- design optical components that are able to be manufactured and measured using state of the art optical fabrication technologies

INTENDED AUDIENCE

Optical engineers, lens designers, or managers who wish to learn more about how infrared optical materials, fabrication and testing affect the optical designer. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Jessica DeGroote Nelson is the R&D manager and scientist at Optimax Systems, Inc. She specializes in optical materials and fabrication processes. She is an adjunct faculty member at The Institute of Optics at the University of Rochester teaching an undergraduate course on Optical Fabrication and Testing, and has given several guest lectures on optical metrology methods. She earned a Ph.D. in Optics at The Institute of Optics at the University of Rochester. Dr. Nelson is a member of both OSA and SPIE.

Multispectral and Hyperspectral Image Sensors

SC194

Course Level: Advanced
CEU: 0.35 $375 Members | $425 Non-Members USD
Tuesday 8:30 am to 12:30 pm

This course will describe the imaging capabilities and applications of the principal types of multispectral (MS) and hyperspectral (HS) sensors. The focus will be on sensors that work in the visible, near-infrared and shortwave-infrared spectral regimes, but the course will touch on longwave-infrared applications. A summary of the salient features of classical color imaging (human observation) will also be provided in an appendix.

LEARNING OUTCOMES

This course will enable you to:
- understand many of the applications and advantages of multispectral (MS) and hyperspectral (HS) imaging
- describe and categorize the properties of the principal MS / HS design types (multi-band scanner, starers with filter wheels, dispersive, wedge, and Fourier transform imagers with 2D arrays, etc.)
- list and define the relevant radiometric radiometric quantities, concepts and phenomenology
- understand the process of translating system requirements into sensor hardware constraints and specifications
- analyze signal-to-noise ratio, modulation-transfer-function, and spatial / spectral sampling for MS and HS sensors
- define, understand and apply the relevant noise-equivalent figures-of-merit (Noise-equivalent reflectance difference, Noise-equivalent temperature difference, Noise-equivalent spectral radiance, Noise-equivalent irradiance, etc.)
- describe the elements of the image chain from photons-in to bits-out (photon detection, video signal manipulation, analog processing, and digitization)
- list and review key imager subsystem technology elements (optical, focal plane, video electronics, and thermal)
- formulate a detailed end-to-end design example of a satellite imaging scanning HS sensor
- provide an appendix that summarizes color imaging principles and sensor associated elements for human observation applications (e.g. color television, still cameras, etc.)

INTENDED AUDIENCE

Engineers, scientists, and technical managers who are interested in understanding and applying multispectral and hyperspectral sensors in advanced military, civil, scientific and commercial applications.

INSTRUCTOR

Terrence Lomheim holds the position of Distinguished Engineer at The Aerospace Corp. He has 34 years of hardware and analysis experience in visible and infrared electro-optical systems, focal plane technology, and applied optics, and has authored and co-authored 63 publications in these technical areas. He is a Fellow of the SPIE.

COURSE PRICE INCLUDES the text *CMOS/CCD Sensors and Camera Systems, 2nd edition* (SPIE Press, 2011) by Terrence Lomheim and Gerald Holst.

Engineering Approach to Imaging System Design

SC713

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Monday 8:30 am to 5:30 pm

This course discusses the three popular approaches to electro-optical imaging system design: spatial resolution, sensitivity (signal-to-noise ratio), and modulation transfer function (MTF) analysis. While often evaluated individually, all three must be considered to optimize system design. Usually, the dominant MTFs in machine vision devices are image motion (including random vibration of the sensor), optics (including aberrations), and the detector. For man-in-the-loop operation, the display and the eye are of concern and, in many situations, these limit the overall system performance.

Equally important, but often neglected is sampling; an inherent feature of all electronic imaging systems. Sampling, which creates blocky images are particularly bothersome with periodic targets such as test targets and bar codes. An engineering approach is taken. This course will provide numerous practical design examples (case studies) to illustrate the interplay between subsystem MTFs, resolution, sensitivity, and sampling.

LEARNING OUTCOMES

This course will enable you to:
- use approximations; often called ‘rules-of-thumb,’ or ‘back-of-the-envelope’ analysis
- identify the subsystem components that affect resolution and sensitivity
- determine if your system is resolution or sensitivity limited
- equivalently determine if your system is detector-limited or optics-limited
- determine which subsystem limits system performance and why
- understand sampling artifacts (Nyquist frequency limit, aliasing, Moiré patterns, and variations in object edge location and width)
- use MTFs, resolution, sensitivity, and sampling concepts for system optimization
- understand the trade-off between MTF and aliasing

INTENDED AUDIENCE

The course is for managers, system designers, test engineers, machine vision specialists, and camera users who want the best performance from their systems. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference *Infrared Imaging Systems: Design, Analysis, Modeling and Testing* since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and IEEE and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Holst’s Practical Guide to Electro-Optical Systems* (JCD Publishing, 2003) by Gerald C. Holst.

Electro-Optical Imaging System Performance

SC154

Course Level: Intermediate
CEU: 0.65 $600 Members | $695 Non-Members USD
Thursday 8:30 am to 5:30 pm

While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). System analysis could be performed in the spatial domain. However, it is far easier to work in the frequency domain using MTFs. Subsystem MTFs are combined for overall system analysis. This is often called image chain modeling. Although the math is sometimes complex, the equations are graphed for easy understanding. With the Sept 2002 models (e.g., NVTherm), the minimum resolvable temperature (MRT) and minimum resolvable contrast (MRC) are coupled with the target signature and atmospheric transmittance to provide range performance predictions (target acquisition modeling). Three ranges are predicted: detection, recognition, and identification (often shorten to DRI). DRI ranges depend upon the subsystem MTFs, noise (primarily random and fixed pattern noise), the display, and the eye's response. The two-dimensional (fictitious) spatial frequency approach, three-dimensional noise model, and target discrimination metrics (Johnson's N50) are applied to performance predictions. The 2007 models (e.g., NVThermIP) employ contrast rather than MRT (MRC) for target acquisition and use V50 as a discrimination metric. Limitations and applications of NVTherm and NVThermIP are discussed with a brief demonstration of the models. Selection and optimization of a specific sensor depends upon a myriad of radiometric, spectral, and spatial parameters (e.g., target signature, atmospheric conditions, optics f-number, field-of-view, and detector responsivity). MTFs and their effect on imagery are interactively demonstrated. Spatial sampling is present in all cameras. Super-resolution reconstruction and microscan minimize sampling artifacts. Several optimization examples are discussed (case study examples).

LEARNING OUTCOMES

This course will enable you to:

- use the correct MTFs for image chain analysis
- describe the radiometric relationship between delta-T and spectral radiance
- compare the differences among scanning, staring, and microscan staring array performance
- recognize the limitations of back-of-the-envelope approximations such as resolution and sensitivity
- identify the subsystem (e.g., motion, optics, detector, electronics, and display) that limits performance
- appreciate limitations of range performance predictions (target acquisition predictions)
- determine if mid-wave (MWIR) or long-wave (LWIR) infrared is appropriate for your application
- appreciate the value of graphs rather than a table of numbers
- be conversant with the myriad of technological terms
- become a smart buyer, analyst, and/or user of imaging systems

INTENDED AUDIENCE

This course is intended for engineers, managers, and buyers who want to understand the wealth of information available from imaging system end-to-end analysis. It is helpful if the students are familiar with linear system theory (MTF analysis).

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Electro-Optical Imaging System Performance, Fifth Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Signal & Image Processing

Fundamentals of Electronic Image Processing

SC066

Course Level: Introductory
CEU: 0.65 $585 Members | $680 Non-Members USD
Monday 8:30 am to 5:30 pm

Many disciplines of science and manufacturing acquire and evaluate images on a routine basis. Typically these images must be processed so that important features can be measured or identified This short course introduces the fundamentals of electronic image processing to scientists and engineers who need to know how to manipulate images that have been acquired and stored within a digital computer.

LEARNING OUTCOMES

This course will enable you to:

- describe image storage, acquisition, and digitization
- become familiar with image transforms such as Fourier, Hough, Walsh, Hadamar, Discrete Cosine, and Hotelling
- explain the difference between the types of linear and non-linear filters and when to use each
- learn the difference between types of noise in the degradation of an image
- apply color image processing techniques to enhance key features in color and gray scale images
- recognize image segmentation techniques and how they are used to extract objects from an image
- explain software approaches to image processing
- demonstrate how to use the UCFImage image processing software program included with the course.

INTENDED AUDIENCE

This course will be useful to engineers and scientists who have a need to understand and use image processing techniques, but have no formal training in image processing. It will give the individual insight into a number of complex algorithms as it applies to several different applications of this very interesting and important field.

INSTRUCTOR

Arthur Weeks holds an associate professor position with the Dept. of Electrical and Computer Engineering at the Univ. of Central Florida. He recently left his position as a vice president of corporate technology to continue his research in image processing and bio-medical signal processing. He has published over 30 articles and three books in image processing.

COURSE PRICE INCLUDES the text *Fundamentals of Electronic Image Processing* (SPIE Press, 1996) by Arthur Weeks.

Statistics for Imaging and Sensor Data

SC1072

Course Level: Introductory
CEU: 0.65 $575 Members | $670 Non-Members USD
Monday 8:30 am to 5:30 pm

The purpose of this course is to survey fundamental statistical methods in the context of imaging and sensing applications. You will learn the tools and how to apply them correctly in a given context. The instructor will clarify many misconceptions associated with using statistical methods. The course is full of practical and useful examples of analyses of imaging data. Intuitive and geometric understanding of the introduced concepts will be emphasized. The topics covered include hypothesis testing, confidence intervals, regression methods, and statistical signal processing (and its relationship to linear models). We will also discuss outlier detection, the method of Monte Carlo simulations, and bootstrap.

LEARNING OUTCOMES

- apply the statistical methods suitable for a given context
- demonstrate the statistical significance of your results based on hypothesis testing
- construct confidence intervals for a variety of imaging applications
- fit predictive equations to your imaging data
- construct confidence and prediction intervals for a response variable as a function of predictors
- explain the basics of statistical signal processing and its relationship to linear regression models

- perform correct analysis of outliers in data
- implement the methodology of Monte Carlo simulations

INTENDED AUDIENCE

This course is intended for participants who need to incorporate fundamental statistical methods in their work with imaging data. Participants are expected to have some experience with analyzing data.

INSTRUCTOR

Peter Bajorski is Professor of Statistics and Graduate Program Chair at the Rochester Institute of Technology. He teaches graduate and undergraduate courses in statistics including a course on Multivariate Statistics for Imaging Science. He also designs and teaches short courses in industry, with longer-term follow-up and consulting. He performs research in statistics and in hyperspectral imaging. Dr. Bajorski wrote a book on Statistics for Imaging, Optics, and Photonics published in a prestigious Wiley Series in Probability and Statistics. He is a senior member of SPIE and IEEE.

COURSE PRICE INCLUDES the text *Statistics for Imaging, Optics, and Photonics* (Wiley, 2011) by Peter Bajorski.

Multispectral Image Fusion and Night Vision Colorization

SC1135

Course Level: Introductory
CEU: 0.35 $295 Members | $345 Non-Members USD
Thursday 8:30 am to 12:30 pm

This course presents methods and applications of multispectral image fusion and night vision colorization organized into three areas (1) image fusion methods, (2) evaluation, and (3) applications. Two primary multiscale fusion approaches, image pyramid and wavelet transform, will be emphasized. Image fusion comparisons include data, metrics, and analytics.

Fusion applications presented include off-focal images, medical images, night vision, and face recognition. Examples will be discussed of night-vision images rendered using channel-based color fusion, lookup-table color mapping, and segment-based method colorization. These images resemble natural color scenes and thus can improve the observer's performance. After taking this course you will know how to combine multiband images and how to render the result with colors in order to enhance computer vision and human vision.

In addition to the course notes, attendees will receive a set of published papers, the data sets used in the analysis, and MATLAB code of methods and metrics for evaluation. A FTP website is established for course resource access.

LEARNING OUTCOMES

This course will enable you to:
- review the applications and techniques of image fusion and night vision enhancement
- categorize multiscale image fusion methods : image pyramid vs. wavelet transform
- apply quantitative vs. qualitative evaluation
- investigate advanced fusion applications: color fusion and face recognition
- obtain an overview of colorization methods: color mapping, segment-based, channel-based
- evaluate colorized images: qualitative vs. quantitative, and links to the NIIRS (National Imagery Interpretability Rating Scale) ratings
- explore information fusion application to a multispectral stereo face recognition system at four levels: image, feature, score, and decision; qualitatively evaluate performance improvement
- recognize and discuss challenges for future development and applications

INTENDED AUDIENCE

Scientists, engineers, practitioners, students, and researchers who wish to learn more about how to combine multiband images to enhance computer vision and human vision as well as face recognition. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Yufeng Zheng received his PhD in optical engineering/image processing from the Tianjin University in Tianjin, China, in 1997. He is currently an associate professor at Alcorn State University in Lorman, Mississippi. He is the principle investigator of three federal research grants in night vision enhancement, and in multispectral face recognition. He holds two patents in glaucoma classification and face recognition, and has published more than 70 peer-reviewed papers. His research interests include pattern recognition, biometrics, information fusion, and computer-aided diagnosis. He is a Cisco Certified Network Professional (CCNP), and a senior member of SPIE, and IEEE Computer Society & Signal Processing.

Erik Blasch received his B.S. in mechanical engineering from the Massachusetts Institute of Technology in 1992 and M.S. degrees in mechanical engineering, health science, and industrial engineering (human factors) from Georgia Tech. He completed an M.B.A., M.S.E.E., M.S. econ, M.S./Ph.D. psychology (ABD), and a Ph.D. in electrical engineering from Wright State University and is a graduate of Air War College. From 2000-2010, Dr. Blasch was the information fusion evaluation tech lead for the Air Force Research Laboratory (AFRL) Sensors Directorate—COMprehensive Performance Assessment of Sensor Exploitation (COMPASE) Center, and adjunct professor with Wright State University. From 2010-2012, Dr. Blasch was an exchange scientist to Defence R&D Canada at Valcartier, Quebec in the Future Command and Control (C2) Concepts group. He is currently with the AFRL Information Directorate supporting information fusion evaluation. He received the 2009 IEEE Russ Bioengineering Award and compiled over 30 top ten finishes as part of robotic teams in international contests. He is a past President of the International Society of Information Fusion (ISIF), a member of the IEEE Aerospace and Electronics Systems Society (AESS) Board of Governors, and a SPIE Fellow. His research interests include target tracking, information/sensor/image fusion, pattern recognition, and biologically-inspired applications.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:
- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

Analog-to-Digital Converters for Digital ROICs

SC1076

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course surveys structure and operation of analog-to-digital converters (ADCs) implemented on digital readout integrated circuits (ROICs) and digital image sensors. Attendees will learn how to evaluate ADC architectures using basic figures of merit for use in different sensor formats. We will cover a wide range of cutting edge architectures and see published examples without delving into transistor level theory. We will survey both academia and industrial ADC architectures. From this survey attendees will discover the industrial design evolution convergence down to a few workhorse architectures and what lessons it imparts to the image sensor community. If you are interested in the digital ROIC revolution or if you ever interface with designers or evaluate digital ROIC proposals, then you will benefit from taking this course.

LEARNING OUTCOMES

This course will enable you to:
- identify analog-to-digital architectures used for creating digital ROICs and image sensors
- calculate ADC architecture figures of merit important to image sensors
- evaluate ADC architecture compatibility with image sensor format and requirements
- infer the direction in which state-of-the-art digital image sensors are headed
- name the top ADC architectures used by commercial industry and explain how this knowledge benefits the image sensor industry
- stimulate your own creativity and help you develop new ideas and applications for digital ROICs and digital image sensors

INTENDED AUDIENCE

This course is intended for engineers and physicists with a background in basic electrical theory (electrical stimuli, resistors, capacitors and block diagramming) who wish to learn about analog-to-digital converter architectures and how they are applied to digital ROICs and digital image sensors. An undergraduate degree in science or engineering is assumed, and basic knowledge of electrical engineering will be particularly helpful.

INSTRUCTOR

Kenton Veeder is a ROIC design engineer, systems engineer, and part time detector physicist. He has been in the defense and commercial image sensor field for over 12 years and is the president of Senseeker Engineering Inc. in Santa Barbara, California. He has nine patents and several publications, one of which earned the MSS Detectors best paper award in 2006. While working for Raytheon he was awarded recognition as Raytheon's 'Father of the Digital Focal Plane Array' and he and his team were given the company wide 'Excellence In Technology' award. Kenton earned his M.S. in electrical engineering from the Analog-and-Mixed Signal Center at Texas A&M University. Kenton is a member of SPIE and IEEE.

Emerging Technologies

Analog-to-Digital Converters for Digital ROICs

SC1076

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Wednesday 8:30 am to 5:30 pm

This course surveys structure and operation of analog-to-digital converters (ADCs) implemented on digital readout integrated circuits (ROICs) and digital image sensors. Attendees will learn how to evaluate ADC architectures using basic figures of merit for use in different sensor formats. We will cover a wide range of cutting edge architectures and see published examples without delving into transistor level theory. We will survey both academia and industrial ADC architectures. From this survey attendees will discover the industrial design evolution convergence down to a few workhorse architectures and what lessons it imparts to the image sensor community. If you are interested in the digital ROIC revolution or if you ever interface with designers or evaluate digital ROIC proposals, then you will benefit from taking this course.

LEARNING OUTCOMES

This course will enable you to:
- identify analog-to-digital architectures used for creating digital ROICs and image sensors
- calculate ADC architecture figures of merit important to image sensors
- evaluate ADC architecture compatibility with image sensor format and requirements
- infer the direction in which state-of-the-art digital image sensors are headed
- name the top ADC architectures used by commercial industry and explain how this knowledge benefits the image sensor industry
- stimulate your own creativity and help you develop new ideas and applications for digital ROICs and digital image sensors

INTENDED AUDIENCE

This course is intended for engineers and physicists with a background in basic electrical theory (electrical stimuli, resistors, capacitors and block diagramming) who wish to learn about analog-to-digital converter architectures and how they are applied to digital ROICs and digital image sensors. An undergraduate degree in science or engineering is assumed, and basic knowledge of electrical engineering will be particularly helpful.

INSTRUCTOR

Kenton Veeder is a ROIC design engineer, systems engineer, and part time detector physicist. Intelligence, Surveillance, and Reconnaissance

Testing and Evaluation of E-O Imaging Systems

SC067

Course Level: Advanced
CEU: 0.65 $595 Members | $690 Non-Members USD
Friday 8:30 am to 5:30 pm

This course describes all the quantitative and qualitative metrics that are used to characterize imaging system performance. While this course highlights thermal imaging systems, the concepts are generic and can be applied to all imaging systems (CCDs, intensified CCDs, CMOS, and near IR cameras). Data analysis techniques are independent of the sensor selected (i.e., wavelength independent). The difference lies in the input variable name (watts, lumens, or delta-T) and the output variable name (volts, lumens, or observer response). Slightly different test methodologies are used for visible and thermal imaging systems. Performance parameters discussed include resolution, responsivity, aperiodic transfer function, slit response function, random noise, uniformity, fixed pattern noise, modulation transfer function (MTF), contrast transfer function (CTF), minimum resolvable temperature (MRT), and the minimum resolvable contrast (MRC). The eye's spatial and temporal integration allows perception of images whose signal-to-noise ratio (SNR) is less than unity. Since all imaging system spatially sample the scene, sampling artifacts occur in all imagery and therefore affects all measurements. Sampling can significantly affect MRT and MTF tests. Low SNR and sampling effects are interactively demonstrated. This course describes the most common testing techniques. Equally important is identifying those parameters that adversely affect results.

LEARNING OUTCOMES

This course will enable you to:
- write concise test procedures with unambiguous system specifications
- identify all appropriate test parameters
- describe the radiometric relationship between delta-T and spectral radiance
- differentiate between observer variability and system response during MRC and MRT testing
- describe the difference between the CTF and the MTF
- learn about the latest MTF measurement techniques
- discern the difference between poor system performance, peculiarities of the system under test, and measurement errors
- assess how sampling affects test results
- appreciate the benefits and short comings of fully automated testing
- identify parameters that can lead to poor results.
- learn about evolving standardized testing concepts

INTENDED AUDIENCE

The course is for managers, specification writers, and test engineers involved with all phases of imaging system characterization ranging from satisfying customer requirements to ensuring that specifications are unambiguous and testable.

INSTRUCTOR

Gerald Holst is an independent consultant for imaging system analysis and testing. He was a technical liaison to NATO, research scientist for DoD, and a member of the Lockheed-Martin senior technical staff. Dr. Holst has chaired the SPIE conference Infrared Imaging Systems: Design, Analysis, Modeling and Testing since 1989. He is author of over 30 journal articles and 6 books (published by SPIE and/or JCD Publishing). Dr. Holst is a member of OSA and is a SPIE Fellow.

COURSE PRICE INCLUDES the text *Testing and Evaluation of Infrared Imaging Systems, Third Edition* (SPIE Press and JCD Publishing, 2008) by Gerald C. Holst.

Radiometry and its Practical Applications

SC1073

Course Level: Introductory
CEU: 0.65 $590 Members | $685 Non-Members USD
Tuesday 8:30 am to 5:30 pm

This course presents the basic quantities and units of radiometry and the propagation principles enabling calculation of flux transfer. It introduces sources, blackbody radiation laws, and optical material properties including emission, reflection, transmission, and absorption. It surveys optical radiation detectors and radiometric calibration configurations, and presents the Equation of Radiative Transfer and its simplifications. The problem-solving section of the course presents applications in MRTD testing, hyperspectral imaging, UAV sensor requirements, infrared reflectance analysis, and calibration.

LEARNING OUTCOMES

This course will enable you to:

- master the basics of radiometry and their systems of terminology and units
- master key radiometric laws and approximations
- describe the characterization of optical properties of surfaces, materials, and objects
- gain insight into basic properties of optical detectors and radiometric calibration
- identify approaches to problem-solving based on source and geometry considerations
- apply radiometric concepts to problems in areas including MRTD testing, hyperspectral imaging, and UAV sensors

INTENDED AUDIENCE

This course is designed for engineers and scientists dealing with electromagnetic radiation who need to quantify this radiation using international standard units and terminology. It is aimed at technologists seeking to gain familiarity with radiometric concepts and practical examples that they can apply to their own work.

INSTRUCTOR

Barbara Grant , SPIE Senior Member, has more than 30 years' engineering experience and holds an M. S. in Optical Sciences from the University of Arizona, where her thesis work was in remote sensing. She is the author of [i]Field Guide to Radiometry[/i] (2011) and co-author of [i]The Art of Radiometry[/i] (2009), both published by SPIE Press, and she is working on a book on UAV imaging sensors. Ms. Grant has taught radiometry and allied subjects for SPIE and other educational, governmental, and corporate organizations since 2009. Her consultancy, Lines and Lights Technology, has been in business since 1994 and she has addressed radiometric and systems problems throughout the spectrum from UV to IR.

COURSE PRICE INCLUDES the texts *The Art of Radiometry* (SPIE Press, 2009) by James M. Palmer and Barbara G. Grant, and the *Field Guide to Radiometry* (SPIE Press, 2011) by Barbara G. Grant .

3D Imaging Laser Radar

SC1103

Course Level: Introductory
CEU: 0.65 $515 Members | $610 Non-Members USD
Monday 8:30 am to 5:30 pm

This course will explain the basic principles of operation and the fundamental theoretical basis of 3D imaging laser radar systems. An analytical approach to evaluation of system performance will be presented. The design and applications of 3D imaging laser radars which employ staring arrays and flying spot scanned architectures; linear, Geiger mode and heterodyne detection; pulse, amplitude, frequency and hybrid modulation formats; and advanced system architectures will be discussed. Optimization strategies and trade space boundaries will be described. Major system components will be identified and effects of the limitations of current component performance will be identified. These limitations will form the basis of a discussion of current research objectives.

LEARNING OUTCOMES

This course will enable you to:

- identify the major elements of 3D imaging laser radar systems
- list important applications of laser radar
- predict the performance of real or conceptual 3D imaging laser radar systems
- estimate the effect of environmental factors on system performance and image quality
- estimate the effect of improved component performance on overall system performance and image quality
- formulate system level designs for common applications
- compare the 3D imaging laser radar approaches for selected applications
- identify test requirements and strategies for 3D imaging laser radar calibration and test

INTENDED AUDIENCE

Engineers, managers, scientists, and students who want to become familiar with basic principles and applications of 3D imaging laser radars or who want to be able to evaluate the performance of 3D laser radar systems.

INSTRUCTOR

Gary Kamerman is the Chief Scientist at FastMetrix, Inc. He is a Fellow of the International Society for Optical Engineering, the author of "Laser Radar" in the Infrared and Electro-Optical Handbook, and the editor of the SPIE Milestone series Selected Papers on Laser Radar as well as more than 30 other volumes. He has designed, built and tested laser radars and coherent optical systems for over 30 years. He is a technical advisor to the United States Department of Defense, National Aviation and Space Administration, and major international corporations.

Introduction to Electro-Optical Systems Design

SC1112

Course Level: Intermediate
CEU: 0.65 $580 Members | $675 Non-Members USD
Wednesday 8:30 am to 5:30 pm

Using communication theory, this full-day course explains the universal principles underlying a diverse range of electro-optical systems. From visible / infra-red imaging, to free space optical communications and laser remote sensing, the course relates key concepts in science and systems engineering to practical systems issues. To provide realistic understanding of the concepts presented, many real-world examples are included.

This course summarizes laser propagation fundamentals, coherent and incoherent optical system characterization, the effects of optical turbulence and particulate scattering on propagating laser beams, atmospheric and submarine laser communication systems concepts, and laser radar and optical imaging basics. Also included are discussions of adaptive optics, adaptive image processing, statistical hypothesis testing, and their effect on system performance.

LEARNING OUTCOMES

This course will enable you to:

- perform Fourier and Geometric Optics Analyses of electro-optical systems
- estimate detector noise statistics, detector performance, and signal-to-noise ratio
- perform first order image processing, including statistical image enhancements of incoherent images
- calculate contrast, irradiance and radiance created by the propagation of light in particulate environments
- calculate the system link budgets for laser systems, including synthetic aperture ladar
- perform statistical hypothesis testing, which includes how to calculate logarithmic likelihood ratio tests, test statistics, and probabilities of false alarm and detection
- assess and understand real-world Adaptive Optical system performance

INTENDED AUDIENCE

This course is intended for scientists, technical managers and design engineers who are interested in understanding first-order electro-optical system design and the effects that limit system performance.

INSTRUCTOR

Larry Stotts is a consultant and was the Deputy Office Director in the Strategic Technology Office of the Defense Advanced Research Projects Agency. He earned his Ph.D. in Electrical Engineering (Communications Systems) at the University of California at San Diego. He has published over 102 technical reports and journal articles and 2 co-authored books. Recognition of his work includes a Department of Defense Medal for Distinguished Civilian Service; two Secretary of Defense Medal for Meritorious Civilian Service Awards; two DARPA Technical Achievement Awards; The Technical Cooperation Program Technical Achievement Award, and the Naval Ocean Systems Center Technical Director's Award. Dr. Stotts is a Life Fellow of the SPIE, Fellow of the IEEE and a Senior Member and Fellow of OSA.

COURSE PRICE INCLUDES the text *Fundamentals of Electro-Optic Systems Design: Communications, Lidar and Imaging* by S. Karp and L. B. Stotts (Cambridge Press, 2013).

Design of Multiband Optical Systems

New

SC1162

Course Level: Intermediate
CEU: 0.65 $565 Members | $660 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Multispectral and hyperspectral systems are designed to increase target acquisition performance as well as answer SWaP-C (size/weight/power/cost) requirements for defense and remote sensing systems. Recent developments in optical materials enable optical systems that operate over multiple infrared bands simultaneously. This course describes techniques for designing these systems using existing and new chalcoginide materials, and it provides methods for choosing material combinations, laying out systems, and predicting performance. An emphasis is placed on understanding dispersion and thermal characteristics in order to design achromatic and athermalized dual- and multi-band infrared imaging systems. Additionally, this course will touch upon recent advances in fused, layered, and gradient index infrared optics, specifically with regard to chalcoginide materials.

LEARNING OUTCOMES

This course will enable you to:

- lay out lenses using first order optical design methods
- determine a working set of optical materials based on optical and thermal characteristics
- construct glass maps for dual-band solutions
- optimize glass types using private catalog materials and optimize systems by employing user-defined merit function constraints
- describe axial and radial gradient index infrared materials and explain the advantages/disadvantages of each type

INTENDED AUDIENCE

This course is intended for optical designers and engineers wishing to expand their knowledge of infrared and multiband optics, materials, and design principles. A working understanding of optical design methods and experience with optical design software is recommended.

INSTRUCTOR

Blair Unger is Senior Optical Designer at ASE Optics. He has authored and co-authored papers and patents covering a variety of topics ranging from design of infrared chalcoginide systems to novel solar concentrators. He earned a Ph.D. in Optics at the University of Rochester, Institute of Optics. Dr. Unger is a member of both OSA and SPIE.

COURSE PRICE INCLUDES the text *Optical Design Fundamentals for Infrared Systems, Second Edition* (SPIE, 2001) by Max Riedl.

Atmospheric Codes (MODTRAN, FASCODE, and HITRAN) for Sensor Development and Evaluation

SC1137

Course Level: Intermediate
CEU: 0.65 $515 Members | $610 Non-Members USD
Tuesday 8:30 am to 5:30 pm

Passive and active sensors are developed for target acquisition and spectroscopic analysis ranging from the ultraviolet through the microwave region. Accurate atmospheric absorption and emission (path radiance) values are essential for sensor development. This data is obtained using MODTRAN, often used in conjunction with NVThermIP, and other sensor software. HITRAN and FASCODE are used for laser applications.

Emphasis will be placed on solving real world problems. Four typical scenarios will be presented: ground-to-ground, ground-to-air, air-to- air and ground-to-space scenarios. The importance of transmission and radiance for each scenario will be discussed.

The students are encouraged to bring their specific scenarios to the course to be setup and run. A computer will be available and we will run these scenarios and discuss the results. The attendees will be able to take home model input files to be used at their facilities. We will discuss their cases along with the expected transmission and atmospheric radiance values.

LEARNING OUTCOMES

This course will enable you to:

- present an overview and explain the "theory" of the models: emphasis on MODTRAN
- apply the models to atmospheric transmission/radiance, smart weapons for defense applications, EO sensors development/ evaluations, ground and satellite image correction, hyperspectral imaging, laser spectroscopy laser communications and LIDAR/ LADAR systems.
- evaluate a "basic" problem: You are on the ground looking up to an aircraft. Your partner is on the aircraft looking down at the ground. Do you and your partner measure the same atmospheric transmission? Do you and your partner measure the same radiance? Why?
- identify MODTRAN assumptions, capabilities and limitations
- define basic model inputs – i.e. "MODTRAN for Dummies"
- utilize advanced model inputs such as radiosonde data, Lambertian surfaces, BRDF etc.
- solve and run your own specific scenarios
- compare other models and databases: FASCODE, EOSAEL, HITRAN, NVThermIP etc.

INTENDED AUDIENCE

This course is for engineers and scientist involved in sensor design, sensor evaluation, and remote sensing for solving problems ranging from target detection and identification through global warming.

INSTRUCTOR

John Schroeder is the chief scientist of the Ontar Corporation. He has been involved with the development and use of atmospheric and sensor computer models and atmospheric databases for over 40 years. He has numerous publication in scientific journals and conference presentations in related areas.

Dimensionality Reduction for Hyperspectral Image Analysis

New

SC1161

Course Level: Intermediate
CEU: 0.35 $295 Members | $345 Non-Members USD
Wednesday 1:30 pm to 5:30 pm

Hyperspectral imaging is an emerging technique in remote sensing. The very high spectral resolution in the hundreds of acquired images provides the potential of more accurate detection, classification, and quantification than that obtained using traditional broad-band multispectral imaging sensors. However, the resulting high data dimensionality poses challenges in data analysis. This course explains basic principles of dimensionality reduction that can maintain or even improve the performance of hyperspectral data analysis tasks (e.g., detection, classification).

The primary goal of this course is to introduce the preferred feature extraction and feature selection algorithms for hyperspectral imagery. Specifically, two types of dimensionality reduction techniques, transformation-based and band-selection-based, will be studied. For each category, both supervised (with known class types and samples) and unsupervised (without any prior knowledge) approaches will be presented. In addition to the widely-used approaches, the state-of-the-art algorithms (e.g., manifold learning, sparse regression) will be discussed. Performance of all the techniques is evaluated using several real data experiments.

LEARNING OUTCOMES

This course will enable you to:

- use popular transform-based techniques to reduce the dimensionality of hyperspectral images
- use popular band-selection-based techniques to reduce the dimensionality of hyperspectral images
- quantify the performance of a dimensionality reduction technique
- explain the role of involved parameters in performance variation
- identify the best dimensionality reduction technique for a given hyperspectral data
- recognize the state-of-the-art techniques in hyperspectral image dimensionality reduction

INTENDED AUDIENCE

Scientists, engineers, technicians, or managers who wish to learn more about how to effectively analyze hyperspectral remote sensing data. Undergraduate training in engineering or science is assumed.

INSTRUCTOR

Qian (Jenny) Du has been conducting research on hyperspectral image processing and analysis for more than fifteen years. She has numerous peer-reviewed publications in this field, and developed several well-received algorithms. She currently is Bobby Shackouls Professor in the Department of Electrical and Computer Engineering at Mississippi State University. Dr. Du was a selected lecturer for IEEE Geoscience and Remote Sensing Symposium in 2009-2013, and a selected lecturer for the 5th IEEE GRSS Workshop on Hyperspectral Signal and Image Processing: Evolution in Remote Sensing (WHISPERS). She is an Associate Editor for IEEE Journal of Selected Topics in Applied Earth Observations and Remote Sensing, IEEE Signal Processing Letters, and SPIE Journal of Applied Remote Sensing.

Electro-Optical Imaging System Performance

SC154

Course Level: Intermediate
CEU: 0.65 $600 Members | $695 Non-Members USD
